# CRUSHING ROLLS

With Fixed Bearings and Without Springs.

Mr. Mill Man:

When you stand by your spring-full rolls, and your whole being vibrating in unison with them—and the mill—and you hear the pound of the jumping shells, the rattle of the dancing bolts, and the groan of the elevator loaded with oversize, do you not wish for a machine that would hold together for an hour that you might have peace?

If the springs cause so much trouble, why not do away with them? We make Rolls without springs.

If the proper adjustment on spring rolls is to set up the tension bolts that the shells do not separate when crushing ore, what is the sense of the springs?

It is just as wise to put a spring under every nut on the machine, or under every nail head in your mill.

Are springs used on the rolls in rolling steel rails or structural iron? Not unless they want irregular and oversized rails.

If you desire a uniform product and one less elevator, use our Rigid Rolls, which produce no oversize.

## THE WILFLEY SLIME TABLE.

**THE WILFLEY SLIME TABLE** is an entirely new invention, using new principles for the separation of fine particles of mineral from its gangue.

The table consists of a number of small, shallow troughs having the bottom of each covered with duck or heavy canvas. These troughs are arranged side by side and attached to chain belts, forming in the whole a large belt which moves across the table very slowly, taking about 30 minutes to make one complete revolution. While this belt or series of trays is slowly moving lengthwise of the table an oscillating motion is given to deck crosswise. This motion is produced by a simple movement, similar to that used on the Wilfley Concentrator, the revolution of the belt being produced by worm gear and shaft geared to the head motion eccentric shaft. The belt is driven from this worm shaft by sprocket wheels and link chain. The oscillating motion carries off the particles of silica and gangue, while the smaller particles of ore, concentrates and slimes remain in the divisions or boxes of the main belt and pass slowly over the end of the table, where they gradually reach the under side of the table, and, as they pass over a concentrates box, the values are sprayed by a small stream of water and washed into the concentrates box. The compartments on the main table top or belt come upon the other side of the table cleaned and ready for the feed again. The tailings, silica, etc., pass off the end of the table into launders, which dispose of them on the dump as worthless matter.

**THE WILFLEY SLIME TABLE** is designed to receive the entire tailings and wash water from one Concentrating Table, and reconcentrate the tailings. The slime table is adjusted to all classes of tailings by a simple adjustment of the stroke and the adjusting screws under the rocker supports.

## THE PREJUDICE

Against the Electric Drill has been caused by inefficient drill mechanism.

## The NEW JACKSON ELECTRIC DRILL

is the greatest piece of drill mechanism in the world, combining, as it does, the only two successful means of cutting rock, namely: a combined hammer and piston movement.

WILL DO THE WORK OF AIR DRILLS, AT ONE-SEVENTH THE COST OF OPERATING.

No FLEXIBLE SHAFT; no separate MOTOR weighing 380 pounds; no water tank; no hollow tubes; no separate controller, making other Electric Drills unsatisfactory and impracticable.

HANDLED THE SAME AS AN AIR DRILL. WHEN THE DRILL IS MOUNTED IT IS ALL THERE.

Cost of repairs less than any drill now in use. Can be connected to any current or to any power.

Why purchase a cumbersome and expensive air compressor plant when you can install the JACKSON ELECTRIC DRILL at one-seventh the cost of operating and installing?

Write for information.

THE JACKSON ELECTRIC DRILL & SUPPLY CO.  
521 Ernest & Cranmer Building, DENVER, COLORADO.

See our Drill in operation at the St. Louis World's Fair; east corridor Mines and Metallurgy Building, opposite to the main entrance of the U. S. Government Building.

## WOOD DRILL WORKS, PATERSON, N. J.

Makers of the ROCK DRILL that can be "cleaned-up with a sledge hammer" and wiped off with a scoop-shovel" and yet "stay with you."

# COM-PRESSORS ROCK DRILLS AIR TOOLS

## READ--MARK--LEARN.

¶ The splendid showing made by the Rand drills at the South African tests has turned the attention of rock drill users to the construction and "points" of our drills.

¶ They are made with "RAND" experience back of them.

¶ They have the earmarks of the honest maker—and those earmarks show up in such a test as the one held at Johannesburg.

¶ One-third less air consumption than all other drills taking part in the trials—that's their record.

¶ The other drills—we're not mentioning any names—did all sorts of embarrassing things and some of the agents wanted them run over again.

¶ One of our drills was unpacked from its box and set right to work.

¶ It worked.

¶ Compressors—do you need one? Our compressors have the "Rand Reputation" to sustain also.

¶ A new miniature Compressor Catalog just issued—want it?

## IT'S FOR YOU TO DECIDE.

WALLSTREET, COLO., May 23, 1904.

C. H. SHAW P. T. CO.  
Denver, Colo.

DEAR SIR:

I have tried one of your Pneumatic drills for three weeks on stope work, shaft work and drift work, and I am satisfied that your drill is all right anywhere it is put. I worked it by the side of two Sullivans in a crosscut and could beat the Sullivan one-half. One Sullivan 2½, other 2½. I will bet \$100 against any drill that is made and if you can get any person or persons that want to take this offer, send them up with the money.

[Signed] JAMES CARBIS, Foreman,  
Wood Mountain Mine, Boulder, Colo.

1725 Arapahoe Street, Denver, Colo.

WEIGHT, FIFTY POUNDS.

They are as fine as silk,  
as accurate as a clock,  
indispensable in repair shops  
and will last a life time.

The only Air Meter made that is guaranteed to measure the amount of free air used by a rock drill correctly regardless of pressure. Made in sizes from 20 to 10,000 cubic feet capacity.  
We name a drill to our customers, that we find to use less repairs and to cut 35% more with given amount of air than any of the standard makes.

PRICE OF ABOVE METER (MODEL A) \$125 F. O. B. DENVER.

REFERENCE:  
DENVER SAVINGS BANK.

G. D. WARREN & CO., 1520 Eighteenth St., Denver, Colo.

Cleveland New York St. Paul Indianapolis San Francisco London, Eng.

THE CONDUCT OF MINING OPERATIONS ON A BUSINESS BASIS  
INVOLVES THE USE OF THE **BEST MACHINERY**

## WHY PREFER THE "WATER LEYNER"?

### BECAUSE—

1. It accomplishes more work than any other drill of equal cylinder diameter.
2. It does this on **less than 60 per cent** of the air required by such other drills.
3. It is efficient in formations where other drills are helpless. Is capable of crossing slips and seams with ease and without "fitchering."
4. No working through cuttings. Face of rock is kept clean.
5. It lays the dust. No "miners' phthisis."
6. Its weight is one-half that of piston drills. The principle of the machine does not require the excessive weight.
7. It has the smallest number of parts and they are inexpensive.

### IS NOT SUCH A DRILL WORTH A TRIAL?

THEY ARE SOLD ON OUR GUARANTEES.

We furnish complete equipment for mines and will send a competent man to do the erecting, if desired.

DRILL AND COMPRESSOR CATALOGUES FOR THE ASKING.

**THE J. GEO. LEYNER ENGINEERING WORKS CO.**  
**DENVER, COLO., U.S.A.**

## THE BEST WAY to Treat Slimes is NOT TO MAKE THEM.

**DO YOU KNOW** that hundreds of thousands of tons of ore that defied concentration with the stamp mill have been successfully concentrated after being crushed in the KINKEAD MILL?

**DO YOU KNOW** that tens of thousands of dollars have been taken out of the waste dumps of the Bonanza Mines of the Comstock with this Mill: rock so low in value that it was used to grade the streets with?

**DO YOU KNOW** that thousands of tons of hard quartz from the lower levels of the Comstock have been and are being successfully treated by the Kinkead Mill to-day?

**DOES IT INTEREST YOU TO KNOW** that we are operating six mills and six concentrators with less than 20 Horse Power, and that as far as ease of installation, economy in power and wear, and in even quality of pulp delivered, is concerned, the Kinkead Mill is as far ahead of other mills as the Pullman car is ahead of the stage coach?

**LASTLY, DO YOU REALIZE** that crushing by percussion is wrong in principle, and that crushing by a pressure is the correct way?

**IF YOU WANT TO KNOW MORE** about what the Kinkead Mill can do, write us.

(PATENTED.)

Jackson's Horizontal Series 2-Step Centrifugal Pump, Belt Driven, Raising Water 400 Feet.

# Wonder of the Age!

## Jackson's High Head Centrifugal Pump.

Guaranteed to raise any quantity of water to elevations ranging from 10 to 2000 feet, and give an efficiency of 70 to 84 per cent.

It is especially adapted for draining mines, sinking shafts, creating artificial pressure for hydraulicking, irrigation, reclamation, etc. The first cost is less than a reciprocating pump and the cost of repairs is practically nothing, there being no valves or close-fitting parts to wear or get out of order. The Pump is so constructed that it will pump sand and gravel with the water without injury to the Pump.

OUR CENTRIFUGAL PUMPS BEAT THE WORLD FOR  
EFFICIENCY, ECONOMY AND DURABILITY.

# UNION IRON WORKS,

222 MARKET ST., SAN FRANCISCO, CAL.

UNION IRON WORKS  
SAN FRANCISCO, CAL.

We are introducing to the mining fraternity of this country a type of Roasting Furnace having an enviable reputation for all around efficiency and economy in Australia and other British Colonies where it was perfected and first put into operation.

It has points of superiority over all other types of mechanical Roasting Furnaces that we would like to explain to interested parties.

STEAM ELECTRICAL AND HYDRAULIC ENGINEERING — MINE AND SMELTER SUPPLIES.

## JELINEK SAFETY

Cage Bottoms with Chair Thrown Out.

## CAGE CHAIRS

Showing Cage Equipped with Jelinek Chairs as Landed at Level.

Are absolutely safe, and cost much less than shaft chairs.

Can be operated from the cage; from any level, without reaching into the shaft; from the collar of the shaft, or by a lever located on the engineer's stand. When thrown out, the chairs form an extension of the track from the cage level to the shaft level.

We build cages equipped with these chairs, or shaft chairs to be adapted to cages now in use.

Showing How Chairs Drop Automatically Into Shaft When Cage is Hoisted.

# The F. M. Davis Iron Works Co.,

DENVER, COLO., U. S. A.

LOCATED IN THE CENTER OF THE GREATEST MINING DISTRICT IN THE WORLD

With an experience of thirty years and a factory completely equipped, and modern in every respect,

## KNOW HOW TO BUILD MINING, MILLING AND SMELTER MACHINERY.

We build

Sampling Mills,  
Stamp Mills,  
Concentrating and  
Amalgamating  
Mills,  
Cyanide Mills,  
Chlorination Mills.

We build

Smelters for Silver,  
Lead, Copper and  
Zinc Ores,  
Hoisting Plants,  
Power  
Transmission  
Machinery, etc.

## EXHIBITS AT ST. LOUIS FAIR.

Manganese Steel Castings—Carbon Steel Castings—Nickel Steel Castings

In Great Variety and for Many Purposes.

### THE TAYLOR IRON & STEEL CO.

Exhibits in this block occupy over 1000 square feet, and include all classes of Mining Machinery, Ore and Rock Crushing and Handling Machinery, Dredges and Steam Shovels, Screens, Cement and Brick Making Machinery, Steel Tired Car Wheels, Bucket Lips and Teeth, Machinery Parts, &c., &c.

Block 73  
Mines Building.

### THE MANGANESE STEEL SAFE CO.,

Plainfield, N. J.,

Shows finished specimens of "TAYLOR-MADE" Manganese Steel Burglar and Mob Proof Vaults and Safes, in which at night are stored the precious metal and gem exhibits of Alaska, California, Colorado and many other States, and private exhibits on view in the great Mines Building throughout the day.

Block 40  
Mines Building.

### THE INTERNATIONAL NICKEL CO.,

New York City,

Has an interesting exhibit of "TAYLOR-MADE" Nickel Steel Castings, showing the extended use of this quality of steel in the manufacture of machinery and parts.

Block 42  
Mines Building.

### WM. WHARTON, JR., & CO., INCORP.,

Philadelphia, Pa.,

Displays specimens of "TAYLOR-MADE" Manganese Steel Track Work for Steam and Electric Railways.

Columns 8, 9  
and 10  
Transportation  
Building.

In any part of  
the United  
States and for  
any purpose

Manganese, Nickel and Carbon Steel "TAYLOR-MADE" Machinery or Parts will prove to be the best wherever superior quality and durability are required.

## The Tunnel as a Factor in Mining.

In the development and operation of extensive mining enterprises there are two things which are in many instances a constant source of expense and the cause of numerous difficulties. These are the problems of drainage and ventilation. A few years ago these were more serious matters than they are to-day, for the reason that the mechanical means of handling water and ventilating mine workings have been greatly improved within recent years. To a great extent the cumbersome and expensive Cornish pump system of mine drainage has been displaced by modern steam, electric or hydraulic pumping engines, which have a greater efficiency and greatly decreased expense in first cost, as well as in operating expense. The method of mine drainage by means of automatically operated skips has also been improved, and in some instances this method of mine drainage is preferred to any other mechanical means, though where the amount of water to be handled daily is very large, a special shaft and hoisting equipment is desirable, if not necessary, in order to admit of the product of the mine—ore or coal—as well as materials and men being handled. The means of ventilating have also been improved over old practice by the introduction of larger and better ventilating fans and reversible current devices. Although these much desired improvements have been made in the mechanical devices for handling water and for ventilating the workings, the method par excellence for both drainage and ventilation is by means of tunnels. There are many mines and mining regions so situated that tunnels which will intersect the workings at great depth are a physical impossibility, owing to the character of the topography of the country or its altitude. In the central gold belt of California the mine workings of numerous properties are several hundred feet below the level of the sea. Also in the Lake Superior copper region nearly all the extensively developed mines are not only below the level of Lake Superior, but several thousand feet below the level of the ocean. In such regions as these drainage by tunnel must be local and cannot effect the mine to great depth. There are places, however, where long tunnels are justified by the character and value of the mineral resources of the district. Not tunnels a few hundred, or a few thousand feet only in length, run for the development and

Josephine Mine, Harshaw, Arizona. (See Page 6.)

drainage of an individual property, or a restricted group, but tunnels run for the benefit of whole districts. In the State of Colorado, in Idaho, in some portions of California and Arizona, and also in Utah, as well as in other regions, tunnel schemes of this character are possible, which would drain and ventilate all mines connecting with the main tunnel, and afford an economical means for transportation of all the ores of the mines tributary to such adits. In some districts such tunnels as are here contemplated have been run, and in almost every instance the result has proven the wisdom of the projectors of these enterprises. There are a number of such enterprises in Colorado in which some work has been done, but in a number of these instances the rate of progress seems discouragingly slow, probably due to lack of the necessary financial aid. Such operations as these require large capital and energy behind them to push the enterprise to a completion as quickly as possible, as this is the only proper way in which to handle mining propositions of this magnitude and character.

In a district of superficially developed mines—down 1000 feet or less—where there are large bodies of profitable ore, it is the usual experience to find the values, if not decreasing it with depth, to be associated with new combinations, and unfortunately it is usually the case that the change in character of the ore necessitates a change in treatment with an increased expense per ton on that account. With increasing depth also comes additional expense for hoisting, ventilating and drainage, and not infrequently of labor as well, for the reason that miners cannot break ground as cheaply under the increasing difficulties and disadvantages as they can nearer the surface. All of these drawbacks the drainage and transportation tunnel minimizes with decreased cost. When such a project as here suggested is taken up for consideration the first important question should be, does the present condition and past record of the district justify the expense? That is a question which the miners of each district must determine for themselves. If the expense of operating the mines of a district to the depth of 1000 feet has been \$2.50 per ton for mining, and in depth this expense is increased to \$3.50, by reason of the drawbacks above mentioned, and which would be reduced to the former figure or below it by a tunnel run to drain and develop these mines in depth, then the amount of ore which would probably become available above the proposed tunnel level must determine the expediency of the enterprise. If the saving in mining expense can be shown to be \$1 per ton, and 1,000,000 tons of ore would be made available by the proposed tunnel, then it is a good business venture to run a tunnel which will cost not to exceed \$1,000,000. And if a greater amount of ore is considered as probably becoming available, then the enterprise will justify proportionally more expense. All this is based upon the presumption that the ore is of payable kind, which, without absolute knowledge, is somewhat speculative in itself, but great fortunes are expended in sinking shafts in a disappointing search for ore. Would it not be easier, and would not the money expended go farther, if put in a tunnel enterprise. Moreover, tunnels can reach a greater depth than shafts. The Simplon tunnel, now being driven in the Swiss Alps of Europe, has a back of over 6000 feet in one place, a greater vertical depth than any mine shaft ever reached. There are not many places where such depths as this can be attained in reasonable distance, but depths of 2000 to 3000 feet and over are permissible in many mining districts.

It has been the custom for many years to place in quicksilver flasks seventy-six and one-half pounds net of the metal. This practice was the outcome of the Spanish custom. The operators at Almaden for years charged their flasks with seventy-five pounds of quicksilver, and as the Spanish pound is equal to 1.0161 English pounds, it became the practice to place seventy-six and one-half English pounds in the flasks. Recently it was decided to reduce this amount to seventy-five English pounds both in Europe and America.

THE instance of a report by a mining engineer being changed by his clients to suit the requirements of their case, in a diamond mine of South Africa, is not the first of the kind on record. Not infrequently those who employ engineers to make a report on mining property find the report useless from a commercial standpoint, for the report, having dealt with facts, contains no inducement to investors. Accordingly only those portions of the report showing the favorable points are published, the less desirable portions being suppressed. Others less scrupulous even go so far as to change figures and make unwarranted additions to the report, all of which appears above the name of the engineer who made the examination. The only way engineers can guard against imposition of this kind is by rendering a verbal report, in the event of the property being worthless as far as physical evidence upon examination can determine. Ordinarily the engineer is not under contract to make a written report, and there is no law which will compel him to make other than a verbal report. In such an instance no improper use can be made of the name of the reputable engineer.

## Another Tailings Case.

The farmers living along the valley below Clifton and Morenci, Graham county, Arizona, are threatening to bring injunction suits against the copper companies at these towns whose concentrators send a constant stream of tailings into the river, it is claimed to the detriment of the agriculturists. The copper companies are making an earnest effort to lessen the evil by impounding the tailings, and allowing the clear water only to flow into the river. It is desired, if possible, to settle the matter out of the courts. The mines of the district employ a large number of men, and without doubt the direct benefit to the farmers living down the river must be great, but whether the damage from tailings is so extensive as to justify the threatened lawsuits it is difficult to say without a careful investigation. It often seems that great mining companies lack foresight in not anticipating the result of extensive metallurgical operations. Repeated experience in many places has demonstrated the almost futile efforts of smelters to render harmless the great volume of noxious gases rolling from their stacks. If the works are located anywhere else than on a desert or in a country where no damage is possible, some one is sure to claim great injury and the smelter is condemned in the public mind as a great evil, but if the smelter shuts down and a thousand or more men are thrown out of employment thereby, then the "injured farmer" has no further excuse in claims for injury sustained, and usually little excuse for longer remaining in that locality, for there is no demand or sale for his produce. In the case of mill tailings it is much the same as the slickens of the hydraulic miner. Large capital is invested in the operation, hundreds of men are given steady employment at good wages, and the whole community is prosperous in consequence, but a few—possibly twenty—ranchers are injured or claim to be damaged by the tailings and threaten suit. Had the company anticipated the result—which was to have been expected—all the farms damaged might have been bought before starting up the mill for the sum now demanded for one of them. An interesting case occurred in South Dakota, where millions of tons of tailings have been run from the mills about Lead and Central City for the past quarter of a century or more, covering several feet deep with sand some vegetable gardens and a few ranches of nominal and uncertain value, owing to the likelihood of spring floods, which at times destroy these places. Some of the farmers saw in this, their misfortune, an opportunity to claim extravagant damages from the Homestake Co., but on discovering that the tailings still contained payable values in gold, which could be recovered by the cyanide process, proceeded at once to assert their ownership to the tailings, and feared the Homestake Co. would lay claim to them.

IN response to the numerous petitions sent to President Roosevelt and to the Bureau of Labor at Washington requesting that the labor troubles in Colorado be investigated, the Commissioner of Labor will undertake the investigation of the causes which led up to the repeated troubles between capital and labor in that State within the past year. It is said to be the intention to go back into the history of these difficulties as far as may be necessary to determine the real cause of the repeated strikes and the lawlessness which has characterized them. It is hopeful that the inquiry will be conducted impartially and fully, and that the report will make clear to what extent, if at all, the strikes were justified. It is scarcely necessary to say that whatever justification there may have been in the several strikes, there was none at all in the numerous murders and other lawless acts which have been an accompaniment of these labor difficulties.

IN laying out turnouts and curves in underground track, mine foremen generally pay little regard to the theoretical niceties of the engineering features, but simply put in the track on a short, or long, or reverse curve to suit circumstances. It is largely a matter of convenience, and yet there are many instances where it would be well to give more consideration to the laying out of such curves and turnouts. If this were done there would be fewer cars derailed or dumped on the curves constructed at random.

## Safety in Hoisting Ropes.

There seems to be an increasing number of accidents in mines due to the breakage of hoisting ropes. In every well-appointed shaft the possibility of the rope parting is given consideration, and safety clutches or other devices to insure, as far as possible, the safety of men are provided, but aside from these precautionary measures, which should be made compulsory, the hoisting ropes should have a factor for safety of at least seven times the maximum load to be carried—in some localities the legal requirement is a factor of ten. One difficulty seems to be in the purchase of ropes of too small a diameter, and another the frequent winding of ropes having a sufficient diameter for safety over sheaves and drums of too small a diameter. This latter practice results in strains upon the rope which are likely to cause the rope to part without any outward evidence of weakness. When a wire rope is wound around a cylinder the outer wires and strands carry the greater portion of the load—a far greater amount than they alone are calculated to sustain. Ropes are often used longer than safety will admit, but this is reduced somewhat by periodically cutting off a yard or two of the rope from the end attached to the skip. It is not due to an over use of the cable, nor to an insufficient factor of safety, that the frequent breakage of ropes occurs, but rather to the tremendous strains resulting from sudden starting with a heavy load, or the equally sudden stopping of the rapidly descending skip or cage by too sudden application of the brakes. Still, there are instances where all the necessary factors for safety have been taken, and ropes part without any apparent reason, inspection of the broken rope showing no flaw. There are instances known where an 1½-inch steel cable snapped by the skip wheels coming into collision with an obstruction in the head frame track, when the same rope was sufficiently strong to have pulled the frame down if the pull had been started slowly and applied gradually. These instances emphasize the necessity of exercising care in starting and stopping loaded skips and cages, and avoiding, as far as possible, the unnecessary strains incident to sudden stopping and starting.

AT Pretoria, South African Republic, regulations have been made governing the introduction of Chinese into the Transvaal. In it provision is made in reference to transfer, vaccination, registration, passports, treatment, work, wages and inspection. Women, and children under ten years of age, may accompany men. As a bill has been passed by the Cape Colony Government prohibiting the importation of Chinese coolies, the port of disembarkation is Durban on the east coast, in Natal. The wages which the Chinese laborers are to receive are fixed at one shilling per day of ten hours. The Chinese are excluded from certain skilled callings, except as laborers in such callings. An important phase of the law is that "piece work" may be substituted for day's pay, if both parties to the contract are mutually agreeable. Although it is safe to say that upon their introduction to the deep levels of the Rand mines these strange laborers will be worth little more than a shilling per day and their "keep," it must only be a matter of a short time when they will be able to perform their duties in a manner which should make them at least the equal of the Kaffirs, who, as a class, if not difficult to handle, are at least discouragingly slow.

ONE of the surprising features of gold mining in Alaska is the fact that thus far nearly all the gold from the Yukon basin, from Nome and other districts, aside from that produced on Douglas and Unga islands and some other places along the southern coast, is from placers. The only noted exception being that on Solomon river in the Nome region, where a 10-stamp mill is crushing gold ore mined in veins of the district. The placers of Alaska must have derived their gold from veins, great or small, but with very few exceptions these veins have been little sought, or at any rate remain undeveloped, but the placers will be exhausted in a few years as they have been in other fields, and then will ensue active prospecting and development of the gold bearing veins which underlie the alluvials and rib the mountains.

## CONCENTRATES.

IN THE event of zinc shavings becoming covered with copper, add strong cyanide solution until the copper disappears.

COBALT NITRATE dissolved in water is said to be good antidote in case of cyanide poisoning if taken promptly after the poisoning.

A "DEMASIA" in Mexico is an area of mining ground of less than a full pertenencia in size and lying between previously denounced holdings—a fractional claim.

CHARCOAL has been successfully employed to precipitate gold from solution in both the chlorination and cyanide processes; it is not in general use, however.

THE terms "transit" and "theodolite" are often used interchangeably. By theodolite is generally understood a "Y" instrument, having a horizontal but no vertical movement of the telescope.

IN scientific literature most experiments on temperatures, melting points, etc., are referred to the centigrade thermometer, in which the freezing point of water at sea level is 0 and the boiling point of water is 100°.

A SOLID cubic foot of ordinary gold-bearing quartz will weigh about 165 pounds, and 13 cubic feet of such rock in place weighs one ton. When broken into the usual size for shoveling it requires 20 cubic feet to make one ton.

ANEROID BAROMETERS are made which will measure 3000 feet below the level of the sea. The better ones will read to 1 foot. They are mostly in use in the English coal mines, the workings of many of which are below sea level.

AN AUTHORITY states that there were in actual use in California, prior to the inhibition of hydraulic mining, 6000 miles of ditch, the construction of which had cost \$15,000,000. Portions of some of these ditches and flumes cost \$30,000 per mile.

IF the fuse is too large for the exploders it should be returned to the manufacturers, as it is likely to have been damaged. Triple tape fuse is the best and should always be used in a wet mine. Double tape can be used in outside work in dry weather.

WATER under 485 feet head will give about 1 H. P. per miner's inch (1.5 cubic feet per minute), if the pipe line be 8 inches or more in diameter and the length of the line not over 1 mile. The static pressure under this head is about 195 pounds per square inch.

WROUGHT IRON is less affected by acid vapors than steel, and for that reason is preferable in stacks through which such gases pass. It is suggested that where such stacks are built the interior be given several coats of paint, allowing each coat to dry thoroughly before applying the next.

AN improper and inconvenient arrangement of a mill or concentrator often is the cause of useless expense. In such cases, if the amount of ore to be handled justifies the expense, it were better to make the necessary change in mill arrangement, and reduce the tonnage expense as soon as possible.

A DRILL BIT for drilling sandstone cuts better if forged square across like a chisel, though with a taper on both sides, and with a flattened instead of a sharp cutting edge. A bit of this description disintegrates the sandstone rapidly, while a sharp edge will sink into it and soon become jammed.

THE amount of ore which may be broken down by a single blast, or series of blasts, depends upon the character of the ground and the amount of ore available. In extensive open-cut operations it is not uncommon to break over 1000 tons at a single round of holes. Underground the amount broken is usually much less than this.

THE relative consumption of steam per hour per indicated horse power for various types of steam engines is stated by an authority to be: Plain slide valve engine, 60 to 70 pounds; high speed, automatic engine, 30 to 50 pounds; simple Corliss engine, 25 to 35 pounds; compound Corliss engine, 15 to 20 pounds, and triple-expansion engine, 12 to 18 pounds.

THE average price paid per pound for plate mica in 1902 was 22 cents, and for uncut scrap about \$13 per ton. The price for plate mica varies greatly with the size of the plates and their transparency and freedom from flaws. The mica deposits of Nevada, as far as known, are at the present time too distant from cheap transportation to make mining for the mineral profitable.

IF a drill hole is too large for the sticks of nitro powder, the paper wrapping of the cartridges may be slit in several places, the length of the sticks, or if desired the paper may be removed entirely. The latter, however,

is seldom necessary, and should not be resorted to if it can be avoided, as the handling of the powder is likely to irritate the skin and is very injurious to the eyes.

WHEN attempting to agitate a tank charged with ore by means of compressed air, the introduction of the air beneath the false bottom and filter will not give satisfactory results, as the air will seek the sides of the vat and bubble up all around the edge of the charge instead of uniformly throughout it as desired. A system of perforated pipes must be placed above the false bottom.

WHEN calculating the size of wire which must be used to carry a given amount of electric current, it is necessary to select a wire which will have sufficient size to insure against heating, and must be large enough to keep the loss of volts or "drop" within stated limits. All conductors of electricity have more or less resistance, but one must be employed having sufficient area to keep it within bounds.

A WELL lubricated turn sheet is better than the average turntable as ordinarily built in mines. The latter are often out of repair, or became jammed by rocks working beneath the table. A turn sheet on which are riveted turned flaring rails as guides will answer every purpose, and will last longer than turntables, and may be quickly removed to another place when no longer required where first placed.

THE California courts have held that a contract giving the right to work a mine for a certain time, the gross product to be equally divided between the parties, is not a lease; that such a contract does not create the relation of landlord and tenant, but fixes a rule of compensation for services rendered, and is in all its essential features a contract for labor to be performed and to be paid for by a share of the profits.

IN one instance an ore containing stibnite (antimony sulphide), which yielded unsatisfactory results with fine crushing, is said to have yielded good results with coarse crushing. Some ores containing compounds of antimony may be worked by cyanide after removing the antimony by treating the crushed ore with a solution of sodium sulphide, which immediately dissolves the antimony, which may then be washed out.

THERE may be a slight difference in the meaning of the terms "location" and "claim." A location is usually construed as meaning a single piece of ground 600 by 1500 feet, being the maximum amount permitted under the laws, but a group of several such locations may be considered as constituting a claim. The words are used interchangeably, more or less, though a group of "claims" is never referred to as a "location."

IT does not pay to hoist waste rock to the surface if any place can be found for it underground. A mine should be so developed, as far as possible, to utilize all the waste broken in crosscuts, and other dead work not in ore, using it as filling in old stopes and other excavations, even if the ground stands well and requires no filling. It is cheaper to dump it down a winze than to hoist it to the surface and then tram it to the dump.

A CYANIDE is any substance which will tend to decompose or destroy the effectiveness of the cyanogen in the solution. It is usual that the percentage consumption of cyanide in tests of small lots of ore is greater than when working the same ore on a commercial scale. It is impossible to fix the limitations of ores which may be amenable to the cyanide process. It requires actual experimentation to discover whether or not an ore may be worked.

THE peculiar formation known as "saddle-reefs" occur at Bendigo, in Victoria; at Broken Hill, in New South Wales; at Waverly, in Nova Scotia; at the Santo Domingo mine, in Peru, and near Titiribe, in Antioquia, Colombia, and elsewhere. These formations consist of rolls or folds of metamorphic sedimentary rocks, in which silica has been deposited in the folds of the rock forming the anticlinal folds. Little ore has thus far been found in the synclinal folds.

ZINC "FUME" used in the bromo-cyanide process is obtained from the condensing chamber of the zinc reduction furnaces. It is thrown into the precipitating vat and the solution agitated with compressed air. This causes the fume to be distributed throughout the solution, causing a precipitation of the gold. Cyanide operators are not agreed as to the desirability of precipitation by this method, as it is said to require an excessive amount of zinc and to produce impure bullion.

WHERE it is necessary to place a rock breaker in a mill the machine may be placed on an independent structure of heavy timbers, disconnected from the mill frame or the ore bin timbers, thus obviating the vibration incident to its operation. There are instances where this additional expense has been made for the purpose indicated and subsequently the breaker frame was connected with the ore bins, thus destroying the advantage which might otherwise have been gained.

TO TEST TAILINGS for amount of free acid present make a standard solution of caustic soda by dissolving 10 grams of soda in one liter of water. Weigh out 200

grams of ore and place in a bottle. Add 250 c.c. of water. Titrate the water by adding the soda solution, employing litmus paper to determine when the acid has been neutralized. For each cubic centimeter of soda solution required there must be added to the charge of ore one-tenth pound of soda for each ton of ore, to neutralize the free acid.

EXPERIMENTS in concentration have shown that the facility with which heavy particles of mineral settle on any kind of a concentrating device, or in hydraulic classifiers, is not always in the ratio of their respective specific gravities, but to a great extent is dependent upon the shape of the grain or particles of equal weight. Round or solid granules of any metal or mineral settle more readily than flaky particles of like weight, but the same gravity. Thus granules of metallic copper settle more quickly than scales which have been flattened by rolls or stamps.

IF the pump uses a very large amount of steam, but runs slowly and with great apparent difficulty, there is probably too much friction, due to too tight packing. This can be remedied by cutting the rings a little short and breaking joints; then when the packing swells, on wetting, the joints will fit snugly, but not be too tight. After packing a pump, the condition of the packing can be ascertained by closing the valve of the discharge column just above the pump and turning on the steam. If it makes a stroke or two up and down and then stops of its own accord, the pump is well packed.

FOR laying out mining locations the ordinary compass, having folding sights, affords a fairly accurate means of properly staking the claim. If care be taken in measuring, two men may run the lines of a claim with a precision which will require little change in the monuments, if any, by the surveyor when later surveying for patent. "Stepping off" a claim is, at best, guess work, and the prospector may get more or less than he is entitled to. On his discovery stake, A must post a notice stating how many feet he claims along the lode in either direction from the point of discovery; and should he stake off more than the law allows, B may subsequently encroach upon A's claim to the proper point, beginning another claim where A's claim should properly end. Care in staking the claim will usually avoid such after-complications. Few claims are valuable when first staked, but many become so subsequently, and, in view of this fortunate contingency, the prospector should comply fully with the requirements of the law, and avoid as far as possible any probability of a lawsuit in the future. The more valuable a claim becomes the more likely it is that lawsuits will ensue.

IN RETORTING amalgam raise the heat gradually and continue to heat the charge in the retort as long as quicksilver continues to run from the pipe. During the latter stage of the operation strike the pipe occasionally and the fine globules of mercury will fall in the pipe and run out into the water. Do not allow the fire to go down as long as the delivery tube remains beneath the surface of the water, for should the heat decrease materially the pressure of air on the surface of the water may force some of the water up the pipe and into the retort, when an explosion is almost certain to result. When the quicksilver has all been vaporized from the gold remove the pipe from the water and no explosion is possible. There is much more likelihood of overheating than of overheating retorts. If the heat is insufficient, or is continued for too short a time there will be found quicksilver in the center of the sponge. The mill man weighs the sponge and calls it all gold, when there may remain from 5% to 10% mercury in the central portion of the sponge. When sent to the mint the difference in weight before and after melting may lead to unpleasantness. Another source of discrepancy in weight before and after melting the sponge is in the large amount of iron and other impurities in the amalgam which should have been removed before retorting by thoroughly cleaning the amalgam.

ORES are divided by assayers into three main divisions—siliceous or acid ores, consisting chiefly of silica (quartz or sand); basic ores, containing a considerable percentage of iron oxide, lime, magnesia or baryta; and sulphide ores, which contain a large percentage (10% or more) of pyrite or other sulphide mineral. When mixing charges for the assay of these ores the object is to make a mixture which will result in a fluid slag on fusion. Basic ores require an acid flux, such as silica, borax or glass, and acid ores should have a basic flux. This is usually provided in the form of bicarbonate of soda. Litharge is also added with these ores, and in such cases it acts in a dual role—as a flux and the lead reduced from it acts as a carrier of any precious metal present. When sulphide ores are to be assayed the sulphur is oxidized by means of nitre, or is taken up by the slag by uniting with nails or tacks or pieces of iron wire put into the assay charge. Some assayers roast sulphide ores before assaying, but if care is used in the nitre or nail assay the results by roasting are not better than those obtained by the other method. The fluxes principally used are carbonate and bicarbonate of soda, and carbonate of potassium. Charcoal is one of the best reducing agents known. It will reduce from 25 to 30 times its weight of lead from litharge. Flour will reduce from 12 to 15 times its weight of lead, and sugar about 14 times its weight. Argol reduces about 7 times its weight in lead from the litharge.

## The Young Quartz Miner.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by  
MATT. W. ALDERSON.

Some blacksmiths make a drill pointed like an ordinary cold chisel—square along the cutting edge, with a long taper (Fig. 2.) This is an excellent bit for

Fig. 2.

Fig. 3.

ordinary rock. Other blacksmiths make their bits with a crowning edge (Fig. 3). The writer's preference is for the latter shape, especially in very hard rock, and very soft rock. The bit will endure better under severe work without getting the "big jaw." It cushions in soft ground and one makes better time with it, the square-pointed bit going in deeper but sticking so it prevents one's keeping under steady motion. But good work may be done with either style. The workman may exercise his preference. One advantage of this chisel point is that the bit is more quickly and easily shaped. In either style the bit should be made as sharp as possible. For hard rock the bevel near the edge needs to be about 80° angle; for softer rock it may be 45° or less. It is necessary to make the short lengths, or starters, somewhat wider than those to follow. A set in use by the writer is of  $\frac{3}{4}$ -inch steel, the cutting edge of the starter is  $1\frac{1}{2}$  inch and the others to follow are each narrower in turn up to the drills 3 feet in length, which has a bit to cut  $\frac{1}{8}$  of an inch. With these bits holes are made which are easily charged with sticks of powder  $\frac{3}{4}$  inch in diameter. As the drills are shaped, they should be left where they may have opportunity to cool, before the edge is hardened.

When the drills are sharpened and cooled they are again placed in the fire, a few at a time (so there will be no danger of any one of them becoming overheated), where they are heated to a cherry red, care being taken not to heat more of the point than is necessary. As they reach the red color they are taken out and dipped in water, being moved about as they cool. They are thus hardened ready for use. Most sharpeners harden their steel on a rising heat, believing that in so doing the edge will be the hardest. The idea is that in hardening on a falling heat the body of the drill point would have more heat than the thin edge and would be made harder and be thus liable to "water check" or break in use. The best tool sharpener I ever had in my employ, however, held that with a quick, hot fire the outside of the steel might be hot before the inside would be hot enough. Tempering when steel was in this stage would make the outside harder than that just underneath, and he always hardened and tempered on what he called a falling heat, though it was really on a rising heat, but as that heat began to fall. Taking a tool from the fire, raised to the desired heat, he would hold it a few seconds, till it showed evidence of cooling by turning a shade darker, when he would plunge it. The part just back of the edge will thus be a little harder than that which will first be worn off in actual use.

In hardening bits in this way, the mistakes of the novice, and of some experienced persons, will be in having the steel too hot. Take an instance such as has come under the writer's observation more than once, where a man hardened his own drills. They worked nicely in ordinary ground. He came to very hard ground and the bits wouldn't stand. He made them harder, in an endeavor to make them stand, thereby increasing his troubles. Most miners would be surprised if you told them that their steel should be somewhat softer for very hard rock than for other kinds, yet such is the case. If a drill is too hard, the fact may never be discovered if it is used in soft rock, while it would break with the first few blows against hard rock. It is better for the sharpener to make the mistake of having his drills too soft than too hard, for they may be quickly sharpened and hardened again, if they are not broken. Remember that the hardness of the steel depends on how high it is heated before it is cooled. For ordinary rock, heat to cherry red. For very hard rock, do not have so high a heat, but plunge while the steel is a trifle darker in color. With a clear understanding of the theory, the drill sharpener will soon get so he can harden his drills to suit the rock in which they are to be used.

A mining pick should have a long, thin, sharp point. Taking a pick from a lot in my own shop, I

find the point has an angle of 18°. In other words, it slopes back from the point over 3 inches before it comes to where the shank is an inch thick (See Fig. 1). The writer has known blacksmiths who always left the point of their picks  $\frac{1}{4}$  inch across, and others who made the point with a 45° bevel, like the point

Fig. 4.

of a framing chisel (See Fig. 4). In soft ground, the point needs to be very sharp and thin, that it may be made to penetrate easily and get hold of enough ground to pay for the time needed in which to pry it off. In hard ground the point needs to be sharp, so it will enter crevices easily. If care is exercised so that the thin point is not overheated it may be easily tempered, so that it will stand in the hardest rock. In tempering, the pick point is heated to cherry red. It is then taken from the fire, held a few seconds, till it darkens the least bit, then plunged in water and removed. The point, which was red in color when placed in the water, is now steel gray, but as we watch it we see a blue-purple line flowing down from the shank to the point. This is the "drawing of the temper." There should be sufficient heat in the point to drive the blue-purple to the point with steady, continuous movement; otherwise, reheat. When the purple is within  $\frac{1}{4}$  inch of the point, plunge the point again and leave in the water until it is perfectly cool. The first  $\frac{1}{4}$  inch of the pick point, gray in color, is thus left very hard; just back of it is the purple and back of that the blue, colors on which steel is tempered for cutting metal. A pick point tempered thus is exceedingly tough and the writer has seen picks tempered in this way used in the hardest kind of rock without a single pick point being broken for months at a time. At the same time one may occasionally find a pick or a lot of picks which will not stand so high a temper, because of a greater proportion of carbon in the steel. If so, the remedy is obvious. The purple may be allowed to flow to the point in tempering, and if it is an exceptional pick in a lot that will stand the higher temper the handle may be marked so it will be recognized and tempered according to its needs.

Hardys, cold chisels and tools of similar character used for cutting iron, which may be purchased at hardware stores, are simply hardened and need tempering before being used. Temper them according to above directions for tempering a pick, stopping the flow on the blue, just after the purple has passed off the point. They may then be used to cut the hardest metal.

The gad is a very useful tool which seems to be almost wholly absent from many mines, possibly because so few tool sharpeners know how to shape and temper it. Oftentimes one sees gads of such shape that they would disgust anyone who would try to use them. The gad is a wedge and it needs a long, slim point, so a sufficient amount of the point may enter a crack to hold the gad in place in order that one may

Fig. 5.

Fig. 6.

strike it with a sledge. Fig. 5 shows a gad made by a skilled blacksmith. It required much persuasion to get him to make it what he called "so sharp." It was really dull at the point when made,  $\frac{1}{4}$  inch

across. It widened to the width of the steel in 2 inches. Good work could not be done with it. If it had been sharp it would have made a good maul, for cutting hitches in soft rock. The point was pyramidal in shape, as a maul's should be, but the taper was longer; that was all the difference. Fig. 6 is a well shaped gad. The point of this was sharp as it could be made and it tapered back 4 inches before it was the width of the steel— $1\frac{1}{2}$  inch. Wider on the point in one direction than Fig. 5, it was thinner the other way. It was an excellent gad and the illustration shows its shape after it had been used daily for over two months without sharpening. Most miners who would see such a shaped gad would say it wouldn't stand severe work because of its being so thin. How was it tempered? It was heated to a cherry red and then plunged. The blue was watched till it passed off the point. The gad was dipped again and then driven into soil, where it would cool slowly. The point of the gad was thus the only hard part and that not very hard. The body of the gad was tempered tough, so it would bend before it would break.

In mines where large numbers of men are employed the gad has largely fallen into disuse, not because of lack of recognition of its excellence as one of the tools used in mining, but because so few miners of the present day know how to use it intelligently. Then again it is easier to drill and shoot than to move ground by the pick and gad; so most miners do the drilling, and most foremen prefer that they do so, feeling that better results will follow. Nevertheless, there are times and places when one can advance his work more by the use of a gad than by drill and powder. This is especially true in blocky, jointy ground where the rock is hard. Its use calls for the exercise of judgment. Thus one must learn to know his ground, and if he can move more with the pick and gad than he can in the same time in drilling, he should use the gad. The gad is particularly useful in cleaning up after a round has been fired, in removing all loose rock.

For uniformity of results in tempering one needs as little variation in the light as possible. Steel looks hotter in the dark than in the bright sunlight and one must govern his work accordingly.

In the fall of 1903 I had a record kept of the amount of coal used by two prospectors in sharpening their tools. With a sack of ordinary blacksmith coal weighing 177 pounds, twenty-five fires were built and 760 points sharpened, an average of seven pounds of coal and 30.4 points each time the tools were sharpened, or 4.3 points to each pound of coal consumed.

## Finding the Magnetic Pole by Means of an Assay Balance.

TO THE EDITOR:—It is a fact well known to many assayers that a fairly good and reliable gold balance will at times exhibit freakish traits of character not at all in keeping with its ordinary conduct. At such a time an assayer of good judgment will not attempt to "tinker" the balance, knowing that if he judiciously leaves it alone, or treats it kindly, it will come out all right the next day. Meanwhile he has in mind some fellow whom he suspects of having used it, or touched the outside of the case, or cast an evil eye in its direction. Then he worries his way through the hand samples and defers until next day the work requiring greater precision, keeping his troubles mainly to himself.

One day during the past month a balance the writer was using became so unmanageable that for the time all attempts at weighing had to be abandoned. The behavior of the beam so much resembled the movements of a magnetic needle in unsettled weather that I determined on a certain line of investigation. The balance was a medium grade 8-inch beam by a well-known maker, had been in constant use about four years and was in fair condition. The day in question was not particularly stormy, just boisterous spring weather for a mountain region. A few scattered clouds scurrying around among the trees, the wind blowing in gusts and an occasional dash of rain or hail against the windows, but apparently no electrical disturbance. I examined telephone and light wires, but did not find anything that should produce induction effects, yet could not get the magnetic theory out of mind. After both the weather and balance had become calm the mine foreman came in and he was asked the direction of magnetic "north." He pointed across the room toward a percolator filled with mill tailings or some other equally interesting variety of dirt. The balance was pointed towards the percolator by sighting along the case, carefully leveled up and when it came to the zero the left-hand rider read 39. It was then reversed by turning 180° on the table, when the rider read 53, a difference of  $1\frac{1}{2}$  milligram, making it plain that the trouble had been due to the earth's variable magnetism that the balance had been hunting for the North Pole and became a victim of earth currents. The instrument was then turned 90°, the rider set at 46, the mean between the previous readings, but the pointer would not come to the zero. Evidently the

percolator was a false monument, but nearly right, and the magnetic north pole almost within reach. The balance was next turned little by little until the index came to zero and a line perpendicular to its position established as the true magnetic meridian. The beam when turned into this meridian read  $37\frac{1}{2}$  with a reverse reading of  $54\frac{1}{2}$ , a difference of 17, and the same mean as before.

The pointer or needle on further examination exhibited slight polarity, but did not seem to be strongly magnetized. The difficulty was partially, but not wholly, overcome by turning the balance on the table so that the beam is at right angles to the magnetic meridian, which here is about  $15^\circ$  east of north.

The fact that any piece of iron or steel left long in one position will become polarized by the earth's magnetism would seem to be a good reason why some other metal should be used in the moving parts of a delicate balance. But "there are a good many holes in a skimmer," and as man is not omniscient, one or two holes, more or less, are liable to escape notice. That is probably why everything was not discovered in the beginning.

JOHN RANDALL.

Deadwood, S. D., June 26.

## Geology of the Goldfields District, Nevada.\*

Written by J. E. SPURR.

Interest has been aroused in the new camp of Goldfields, Nye county, Nev. This district is situated  $23\frac{1}{2}$  miles southeast of Tonopah and about 6 miles due east of the old mining camp of Montezuma. Recently some good values in gold have been found; several hundred people have gone there, and ore has been sacked for shipment from some of the mines.

As early as June, 1903, shortly after it had been located, and while only a few men were working,

Peak and Belmont—we may suspect that the limestone is of Cambrian or Silurian age, and that the alaskite may be correlated with the granitic rock intrusive into the limestones in those districts.

The relation between the rhyolite and the alaskite is uncertain. Some phases of the alaskite are not distinguishable in the hand specimen from the rhyolite, and since they have about the same composition one is tempted to consider the hypothesis that they are differently crystallized portions of the same magma; but the strong flow structure of the rhyolite and its usually glassy groundmass indicate that, even if this is so, they were formed under different conditions and at different times, and that the rhyolite was formed near the surface, the alaskite at a considerable depth.

**AURIFEROUS VEINS.**—The chief veins or ore bodies being prospected at the time of the writer's visit are broad masses of white to purplish and reddish, iron-stained cherty quartz, extending irregularly in a northerly direction (N.  $10^\circ$  to  $15^\circ$  W.). There are usually no well-defined walls to these, and the width of the mineralized zones varies from many feet in one place to nothing in another. As reported, the assays made up to that time are very irregular, some average samples giving \$25 to \$50, others only a trace. The values of these are all in gold, very little or no silver being present.

When examined under the microscope, it was found that the ore is a highly silicified rhyolite, and the rhyolite country rock, wherever examined, is itself much silicified. There are many of these silicified reefs, usually forming the crests or combs of ridges on account of their greater hardness.

Near the southern end of the principal ridge described, an average sample of the alaskite from many different places was taken. This contains a trace of gold and 0.11 ounce silver. In the same place a sample was taken of a lens of feldspathic quartz, segregated in the alaskite. This gave a trace of gold and 0.05 ounce silver. This quartz and other similar lenses, however, are of different type

stones into which it is intrusive, within a broad belt following the intrusive contact. They do not occur in the Tertiary rocks.

(TO BE CONTINUED.)

## The Safety of Winding Ropes.

The inquiry into the cage accident at Aldwarke colliery recalls attention to a subject which is of the first importance to the colliery managers, says the Colliery Guardian of London. This accident, by which seven men lost their lives, occurred on February 23rd. About half an hour previous to the accident loaded corves had been hauled twice up and down the shaft to test the rope. On the afternoon of the preceding day the rope inspector had examined this particular rope, and made a satisfactory report upon it. But in spite of these precautions the rope failed shortly after the engineman had reversed his engine, which he did at a distance of six revolutions from the bottom of the shaft. An examination of the fracture did not betray any sign of internal corrosion. The separate strands were well protected from rusting by a tarry coating. The breaking strain of a new rope of the same pattern should be 56 tons; the actual breaking strain of the rope in question varied from  $15\frac{1}{2}$  to 44 tons. Now, the weight upon the rope at the point of fracture was made up of 1196 feet of rope, cage and appurtenances, and men, making altogether less than  $3\frac{1}{2}$  tons, whereas the full corves used for the trial weighed more than 4 tons. No conclusion was arrived at as to the cause of the fracture, and it remains a matter of doubt whether the rope possessed any inherent defect, or whether a sudden jerk, caused by the brake being operated too suddenly, had thrown a greater burden upon the rope than its minimum breaking strain. The tests made by Mr. Pickering's instruction clearly showed too low a fac-

Goldfields, the New Camp in Nye County, Nevada.

some good assays were reported, while other attempts did not succeed in finding much over a trace of gold. The district then was known as the "Grandpa," but the name has since been changed.

**GENERAL GEOLOGY.**—Topographically the district shows a number of low ridges. To the west are basalt-capped mesas, leading up into the higher mountains in the vicinity of Montezuma. The part of the district examined consists of one of the ridges mentioned, which runs in a north-south direction; this was followed for a distance of about 2 miles. On the north end of the ridge the rock is very much altered rhyolite, showing strong flow structure, a glassy groundmass, and porphyritic crystals of quartz, orthoclase, and biotite, which are, however, almost always decomposed. Near the north end of the ridge the igneous rock is chiefly alaskite (quartz-feldspar rock), sometimes of granitic structure, sometimes coarse and pegmatitic, frequently very fine grained. A variation of this is quartz-muscovite rock which, when fine grained, resembles somewhat metamorphosed quartzite. Some of these quartz-muscovite rocks seem to have been originally such, while in other portions the muscovite seems to have formed in little blades at the expense of original orthoclase feldspar. A process of endomorphism similar to that described by the writer in similar rocks at Belmont, is suggested; and since muscovite is, like orthoclase, essentially a silicate of aluminum and potassium, but, unlike it, usually contains a weighable amount of fluorine, the action of this gas is probable. In one of the thin sections a crystal of probable fluorite was detected. Another variation is pure quartz, which occurs in the alaskite in small blotches, lenses, and even in masses 2 to 4 feet in diameter. All these are intrusive into a dark siliceous rock (jasperoid), which is probably the result of the silicification of an original limestone. By analogy with the similar geologic conditions in other districts in the same general region—as at Silver

from the reefs of silicified rhyolite which form the principal ledges.

Lying westerly and northwesterly of Goldfields are Silver Peak and Lone Mountain districts. The Silver Peak quadrangle is mostly in southwestern Nevada, adjacent to the California boundary; one corner of it lies in California.

The area includes the Silver Peak range and the valley which lies east of it, together with some portions of outlying mountains, such as the Palmetto mountains in the southern portion of the quadrangle and Lone Mountain in the northeast portion.

There are at present only a few hundred people within the quadrangle, and the occupations of all of these are connected with the mining industry, and considerable prospecting is being done.

**GEOLOGY.**—The general geology of the region has been examined for the Survey by H. W. Turner. The chief rocks are Paleozoic limestones, granitic rocks of pre-Tertiary age (granites, diorites, etc.), with abundant Tertiary sediments, and Tertiary lavas, such as rhyolites, andesites, and basalts. As is the case in all this desert region, the Pleistocene wash from the mountains, which floors the valleys and fringes the mountains, forms a conspicuous geological feature.

**ORE DEPOSITS.**—Ore deposits are known to exist in several different parts of the Silver Peak quadrangle. The chief districts are the Silver Peak district proper, near its central part, occupying the mountain spur known as Mineral Ridge, west of the camp of Silver Peak; the Lone Mountain district, in the northwestern corner; the Windypah or Fesler district in the southern part of the Silver Peak range; and what may be called the Palmetto district, on the northern slope of the mountains of that name.

All of the districts, and indeed all the ore deposits known, occur in close connection with large intrusive bodies of pre-Tertiary granitic rock. The ore bodies sometimes occur within the granitic rock, but more usually in the Paleozoic (Cambrian and Silurian) lime-

tor of safety; and there can be but little doubt that the rope in question had for some cause or other deteriorated to such a degree that, while still to all appearances sound, it became liable to fracture under any sudden stress.

C. Le Neve Foster has called particular attention to the increase which has taken place in this class of accidents during the last few years. A return was recently made of all breakages of winding ropes used for raising and lowering men, irrespective of any injury resulting from such cause, and the total amounted in 1902 to sixty-four cases, of which six only were due to the failure of couplings. We are not now considering the question of safety catches, but simply the unsatisfactory increase which has occurred in recent years in the number of failures of winding ropes that had previously been considered trustworthy. In Belgium the regulations for winding ropes, in the absence of safety catches, include restrictions as to the permissible working load, which is not allowed to exceed one-tenth of the breaking strain when new, unless the length of 2 meters required to be cut off every three months from the end of the rope shows by actual test that the breaking strain has not been reduced more than one-third. In that country there has been only six cases of broken ropes within the last decade. Contrasted with Belgium, France, and Germany, Great Britain compares very unfavorably as regards the number of winding accidents, and the reflection is unavoidable that something is not quite right with respect either to our system of inspection of ropes or to the factor of safety permitted to exist. In calculating this factor it is obviously useless to estimate only the working load, irrespective of the velocity of arrest practiced by the engineman in winding. The suspicion gathers force that a large number of accidents of this class are to be explained by the sudden application of the brake to a cage falling with considerable velocity. The momentum acquired by a descending cage is considerable, and while the motion continues uniform the strain on the rope may be quite insignif-

icant, and well within the safety factor, allowing even for a reasonable amount of deterioration. But, if we are to rely upon the Sheffield tests, the breaking strain of the Aldwarke rope had fallen to a minimum of 15½ tons, in which case it is not difficult to account for its sudden fracture.

The causes which bring about deterioration in steel ropes are probably more obscure than is generally admitted. Reduction of diameter by wear, and internal or external corrosion by oxidation, are obvious causes of loss of tensile strength; but even the best crucible steel can scarcely be expected to remain free from a certain amount of molecular rearrangement under the influence of a constant succession of strains. Without considering the mysterious influence of fatigue to which metals are liable, winding ropes are subjected while in use to constant elongating influences, which often exceed the elastic limit and induce a permanent set. Small as these effects may be, they are cumulative in their results, and the last straw may be added by a too sudden application of the brake. The remedies appear to be obvious, if in the opinion of the authorities the occasion should demand some revision of existing regulations.

### A Novel Agitator.

TO THE EDITOR:—In the treatment of slimes by the cyanide process there are two important mechanical operations to be performed, viz: The mixture of the cyanide solution with the particles of ore, and the subsequent separation of the precious metals from this mixture. This may be accomplished either by electrolysis, by decanting the liquid, or by filter pressing, and precipitating with zinc, or by other means. There are various devices called agitators, more or less complicated for mixing the pulp and keeping it stirred in order to get the precious metals into solution.

Del Mar Agitator.

I offer an illustration of an agitator that can be used in a conical bottom tank, or a "V" shaped tank, and one which has the advantage of extreme simplicity, and heats the solution, while at the same time agitating it. It is inexpensive to construct and no machinery is required except a boiler supplying steam.

This agitator bears the same relation to mechanical agitators that a steam turbine does to a steam engine, the application of power direct. It may be objected that the solution will absorb the steam before it has done its work. This may be true to a certain extent, but not before the motion is communicated to the surrounding mass. The heating shortens the time of agitation required for a given ore. The action that takes place is the following: The steam from "D" blowing up the tube or pipe "C" causes a circulation of pulp up this tube over the circular plate "A," where it is aerated and continues down to be again forced up the pipe.

Using the decantation process, when the precious metals have been dissolved, the pulp is allowed to settle, the clear liquid drawn off and the pulp is again agitated with water and settled. The tank can be emptied through a drain pipe from the bottom or by forcing the pulp up the pipe and leading it away. "B B" are braces to keep the pipe in place.

Should some process of electrolysis be employed to solve the second mechanical feature, the plates could be attached to the circular plate "A" and the process completed.

It has been urged by some to whom this idea has been suggested that the continuous passing of the pulp over the plate would result in scouring. It is not apparent that the scouring action would be more pronounced than on an ordinary inclined mill plate. Possibly the placing of an annular trough-like section around the base of the conical plate might prove of some value in catching any mercury or amalgam that might escape the plate.

San Francisco, June 20.

### A Gash Vein in Folded Formation.

TO THE EDITOR:—The accompanying sketches are of a folded formation containing a gold-bearing quartz vein, situated in Summit county, Colo. When this mine was discovered the ore was very rich and about 25 feet wide at the surface. The vein matter was silicified quartz porphyry, oxidized and free milling. At the 100-foot level the vein had narrowed down to 15 feet width, though still oxidized and free, but at the

Plan Showing Vein and Outcrop of Folded Slates.

Vertical Cross Section of Vein.

Condition Presumed from Surface Indications, and Before Development.

Longitudinal Section of Vein Showing Folded Strata.

175-foot level the vein was only about 5 feet wide, carrying iron sulphide, and had decreased in gold value and the vein matrix had become kaolinized, and at the contact with the black slate the vein had pinched to nothing and had entirely disappeared, not entering the slate at all or following the contact, which was nearly flat. The surface indications here show the tops of these slate folds eroded so that a dike-like appearance is presented by the porphyry and slate, and the veins cross the porphyry at nearly right angles to the dikes, the vein being nearly vertical. This mine had at one time a 30-stamp mill.

### Boundaries of the United States.

Bulletin No. 226, entitled "Boundaries of the United States and of the Several States and Territories, With an Outline of the History of all Important Changes of Territory," has just been published by the United States Geological Survey for gratuitous distribution. The author is Henry Gannett, who prepared this paper in its first form in 1885, when it was published as Bulletin No. 13. A second edition, much enlarged, constituted Bulletin No. 171, published in 1900. The present work is, therefore, a third edition, and is its own recommendation.

Besides giving the present boundaries of the country and of the several States and Territories, as

defined by treaty, charter or statute, Mr. Gannett presents briefly the history of all important changes of territory and the laws appertaining to those changes. He shows how the boundaries of our country have been affected by the provisional treaty of the United States with Great Britain in 1782, by the treaty with Spain in 1798, by the definite treaty with Great Britain in 1783, by the treaty of London in 1794, by the treaty of Ghent in 1814, by the treaty with Great Britain in 1842, and by the Webster-Ashburton treaty with Great Britain in 1846.

The additions of territory that have come to the United States and the consequent changes in boundary lines are described. They include the Louisiana purchase, the Florida purchase, the Texas accession, the Mexican cession, the Gadsden purchase, the Alaska purchase, and the acquisition of the Hawaiian Islands, Porto Rico, Guam, the Philippine Islands and Tutuila.

A historical review is given of the changes that have occurred in the public domain. A detailed account is also presented of the way in which the present boundary lines of the various States and Territories have been developed. The bulletin, in short, contains in convenient form a great quantity of information that will be useful to the student, teacher, legislator and general reader.

### Mines of Harshaw, Arizona.\*

[FROM A SPECIAL STAFF CORRESPONDENT.]

In the Patagonia mountains, Santa Cruz county, Ariz., is the mineral section variously known as Harshaw, Washington camp, or Palmetto district. It may be reached from Nogales by an 18-mile stage ride to Washington camp, or from the station of Patagonia by stage 8 miles to Harshaw. The district is one of the old new mining fields of Arizona. The old Mowry mine, discovered by Lieut. Mowry, stationed then at Fort Crittenden in the early '60s, and during the civil war was worked by the government for its lead. Twenty years ago the Hermosa mine was worked by Carr & Haggin for its silver. They worked it through a tunnel, and from the upper levels took out more than \$1,000,000 worth of the white metal. Side by side with these is the prospect of Westinghouse, the Du Quesne, with a probability of becoming a great copper producer, and the World's Fair mine, with possibilities in its silver-lead ores. This property is illustrated by one of the accompanying engravings.

Harshaw is the western center of the district, postoffice, store, etc. A hundred yards from it C. B. Adams of the Hermosa M. & M. Co. is erecting a new 50-ton mill. Last August he interested E. L. Conklin and R. Hoffman of Chandler, Okla., and H. F. Burt of Guthrie, Okla., in the purchase of the old

Hermosa property, which had been idle for almost twenty years, and while the upper levels have been stoped out nothing had ever been done below 300 feet. Mr. Adams ran a new tunnel 178 feet below the previous work, and since September has done between 1200 and 1300 feet of work and blocked out ore enough to justify a mill. The ore will be carried 1 mile by mule tram to the mill and treated by Huntington mills and tank amalgamation. Like most ore of the district, it is silver-lead, and is expected to average over 20 ounces silver. Wood at \$4 per cord will supply fuel and there is an abundance of water, which, under the old company, handled much more ore than the present owners expect to produce. The new mill, under the management of N. A. McDonald, will begin operations this month.

Three miles south of Harshaw the World's Fair group, owned by F. Powers and under bond to R. Ferguson and Z. F. Rawson, with Winona, Minn., capital, is making a good showing. The mine is worked through an 800-foot tunnel, at the end of which is a 200-foot winze. Drifting, stoping and sinking are being carried on simultaneously and high-grade ore being shipped.

Near this is the Josephine mine (illustrated in the accompanying engraving), one of the oldest in the district, belonging to R. Farrell and known as the Humboldt M. Co., formerly the Old Trench. It has

\*See illustrations on front page.

two 500-foot shafts and 4000 feet of development work, and \$500,000 has been taken out. At present it is idle.

East of these properties is Cunningham camp, the Endless Chain M. Co. They are driving a 400-foot tunnel to cut a vein, and while they have not yet reached the objective point have cut several other veins. The property consists of eight claims. A few men are steadily employed.

Midway between Harshaw and Washington camp is the old Mowry mine, operated by J. N. Curtis under name of the American Industrial Development Co. While worked for so many years not much depth was obtained, and the present company is sinking and drifting. About 200,000 gallons of water per day is pumped out.

Near the Mowry the Four Metals M. Co. is operating under management of G. D. Gross. The company is composed of Phoenix men; L. B. Christy is president and F. L. Blumer secretary and treasurer. Others interested are G. Luhrs and A. J. Edwards.

Near Mowry, also, is the Chicago & Patagonia C. & G. M. Co., with the Old Soldier group. It is in charge of J. T. Brickwood of Nogales. A. W. Brickwood and E. K. Walker of Chicago are heavily interested. About 300 feet of work has been done in the past four months and about fifteen men are employed. It has one shaft 170 feet, another 110 feet and one of 250 feet of drifting. There are six claims in the group.

At Washington camp, where the Pride of the West M. Co. has a large concentrating plant and furnace, nothing is now being done. A large amount of money has been invested in improvements, which is apparently justified by mineral indications, and it may at any time be again operated.

A mile from this is the camp of the Du Quesne M. & R. Co., the Westinghouse property, with H. S. Stewart in charge. At present the 600-foot shaft is being retimbered, but no development work is being done. The ore is of high grade and lies in a basin of

parture of the body from a vertical, during the time of its rise, will be the integral of velocity times time, for the whole vertical filament, during the time of rise. Dividing the distance which the body has moved downstream by the time of rising gives the average downstream velocity of water in the vertical filament. It is proposed to apply this principle by releasing a ball of wood, celluloid, or hollow brass, at the bottom of the channel from a trap, at a noted instant of time, and then noting the moment at which it appears at the surface. The distance of "departure" may be measured by a floating graduated rod, extended downstream from the vertical rod (or sounding rope) where the ball was released. If lateral departure is to be expected, so that the precise distance from the starting point may not be measured exactly in this manner, it is suggested that a horizontal net set in a wooden frame may be spread on the surface of the water, to catch the ball at the moment it reaches the surface; this would allow the true departure to be measured quite accurately. The author of this principle made some experiments on the time required for different bodies to rise from different depths. He found that the time varies with the specific weight and with the diameter of the ball, but in still water is constant for a given diameter and given specific weight. The time of rise varies directly with the depth. In currents of any appreciable velocity it was found that the disturbance is great enough to make it necessary to measure the time of rise directly, instead of computing it from the (known) depth of water.

### Belt Conveying Systems.

Throughout the West, in Missouri, Colorado, Arizona, Idaho, Montana, Utah and California, the belt conveyor is now being used extensively for handling ores, tailings and all kinds of mineral products. The simplicity and adaptability of the belt conveyor for

of products. Herewith is shown several cuts of belt conveyor carriers of the system referred to as furnished on recent equipments.

The carrier shown in Fig. 1 is made for belts from 14 inches to 42 inches wide, with troughing idlers set at an angle of 20°, running on solid shafts, centrally drilled and fitted with grease cups. These carriers can also be furnished with troughing idlers of 30° or 35°.

The tendency in designing belt conveyors seems to be toward using carriers designed with troughing rollers of moderate angles, say from 20° to 35°, depending somewhat upon the character of the material to be conveyed. The advantage of having troughing idlers and supporting rollers mounted upon independent shafts, with strong supporting side brackets, is apparent. These carriers are being used on systems recently installed for handling gravel, ores, clay, cement, sand, stone, etc.

Figs. 2 and 3 show a two-pulley mounted carrier, designed for belts from 12 inches to 18 inches wide. These have also been installed for conveying heavy materials.

Fig. 4 represents a standard flat belt carrier. Flat conveying belts are used for handling various products, either heavy or light, and under some conditions are preferred to the troughed belts. In using flat conveying belts, however, it is advisable to use troughing idlers at the points where the load is received.

The carriers shown by the accompanying illustrations are made by the Stephens-Adamson Manufacturing Co. of Aurora, Ill., and are illustrated fully in their catalogue No. 7, recently issued.

### The Assay Lead Button.

TO THE EDITOR:—In the issue of the MINING AND SCIENTIFIC PRESS for June 18, "Concentrates" had a paragraph concerning "The adhering of the re-

Fig. 2—Two-Pulley Pedestal Carrier on Steel Channel Bars.

Fig. 4—Standard Flat Belt Carrier.

lime, with porphyry contact, similar to the formation at Bisbee. The property consists of over thirty claims, with a smelter site on the river near Nogales.

R. R. Richardson of Patagonia holds more property in various parts of the district than any other one man. He is not directly engaged in the mining industry, but conducts a general merchandise store.

### New Method of Stream Measurement.

To measure current velocities by direct integration for an entire vertical filament of the cross-section of a channel, S. Hajos, a Hungarian engineer, proposes a novel method which is at least theoretically interesting, says the Engineering News. The principle is as follows: If a body of specific gravity less than 1 is released at the bottom of the channel, it will rise to the surface and simultaneously be carried downstream. The downstream force exerted upon it at each point will be proportional to the velocity at that point. Consequently the total de-

different locations and different kinds of work are features that appeal strongly to all mechanical engineers. The few parts connected with the system consist practically of the conveyor belt, which is usually of rubber, with an extra thick surface of pure soft rubber on the carrying surface, and the carriers together with the head and tail pulleys.

In addition to these appliances there are frequently used distributing trippers for discharging the product at intermediate points, and also loading hoppers for receiving the material at different points. Two important factors in any belt conveyor system are the idlers or carriers and the conveying belt. This belt must be of the best quality of rubber, with an extra thickness of pure soft rubber on the carrying surface from  $\frac{1}{4}$ -inch to  $\frac{1}{2}$ -inch thick, depending upon the character of the material to be conveyed. The "S. A." special conveyor belt has been produced to meet the extreme requirements of heavy conveying. This belt has been tested in some of the largest plants in the country for the past three years and the manufacturers say has met every requirement, and that it is adapted for handling all classes

duced lead in an assay charge to the slag." It has been my experience that in nearly every case this may be overcome by a fluxing suitable to the mineral composition of the ore, and that this fluxing should be done when the charge is first made and not after fusion. It has been my observation that most of the inaccuracies of the assayer's results for the treatment of the sample are due to improper fluxing on account of carelessness or ignorance, or to overheating in an attempt to remedy this, or to rush the work.

Some time ago I was operating with an ore that presented unusual difficulties in the crucible and which were increased by the presence of large quantities of graphite. In this particular instance the fluxing which would secure a desirable slag would also develop all the undesirable features of the graphite, and would cause an excessive amount of reduced lead separated into pellets which settled with the unoxidized graphite and be very troublesome for subsequent manipulation. After experimenting, I hit upon the scheme of fluxing irrespective of the graphite except that I used only enough litharge for the desired size of button and then when the

melt was apparently finished and ready to pour, of adding a quantity of litharge (5 to 25 grams) to the contents of the crucible while still in the furnace, and pouring after allowing only sufficient time for the litharge to fuse and settle. When the pour had cooled I would have a clean bright button surrounded by the fused litharge and surmounted by a clean brittle slag.

I found upon further experimenting that the results would be from 5 cents to 30 cents higher on ton charges according to the grade of the ore. And it was also apparent that the final addition of litharge is an advantage when the ores contain sulphur, arsenic, antimony, and especially when the lead pellets had a tendency to float in the crucible, and even better than to have so great a surplus of the material at the beginning.

ALBERT B. CHITTENDEN.

Los Angeles, Cal., June 27.

### A New Form of Spitzlute.

Within recent years a great deal of attention has been given in California to the concentration of auriferous sulphides in the tailings of stamp mills after passing the concentrating machines. These tailings have been passed on canvas tables of various design, and in most cases the operation has proven profitable. One of the most extensive slimes plants of this description is that at the Zeila mine at Jackson, Amador county, Cal., a description of which has already been published herein. When in operation, the managers of these plants are usually experimenting, with a view to making improvements whereby a closer saving of values may be made or cost of running reduced.

The accompanying sketch shows a change and im-

Hydraulic Sizer, Zeila Mine, Amador County, Cal.

provement in the separator of the Zeila plant, designed by A. M. Hambric of Jackson.

This was installed after the plant had been in operation for some time as an improvement over the original separator. It effects a better separation and requires less water. The slimes are treated on the canvas plant and the coarse sands concentrated on tables.

In operation the principle is similar to that employed in the spitzlute—the upward current created by a stream introduced below under pressure. This causes the slimes to rise, while the coarse material passes out at the bottom.

### Limit to High Voltage in Electric Transmission.

The principal thing which at present limits the distance to which electric power can be transmitted is voltage, or rather insulation, writes Paul M. Lincoln in the electrical number of Cassier's Magazine. The amount of copper, which constitutes a large proportion of the total cost of any given transmission scheme, is directly proportional to the square of the distance and the amount of power transmitted, and is inversely proportional to the square of the voltage used and the loss that takes place in the conductors. It is evident, therefore, that if we could increase the voltage indefinitely, we could increase the transmission distance indefinitely; but we soon come to a limit beyond which we find it is impossible to increase the voltage. Just what this limit in voltage is at present is somewhat a matter of individual opinion, and what it will be in the future involves an exercise of prophetic vision which is beyond the scope of this discussion to assume.

The highest voltage actually in use at the present time is about 55,000. This voltage is used in the Canon Ferry-Butte transmission in Montana, a distance of about 65 miles, and the Shawinigan-Montreal transmission in Canada, a distance of about 80 miles. Higher voltages have been proposed, and in some cases have even been prepared for, in the design of lines and transformers; but up to the present time none higher than 55,000 volts has been put into successful commercial operation.

The most serious difficulties encountered in increasing the voltages of transmission are:

1. Difficulty in maintaining perfect insulation.
2. Difficulty in obtaining proper protection from lightning discharges and other static troubles.
3. Loss of power due to brush discharges from high-tension conductors.
4. Deterioration of high-tension conductors, due

to the fact that compounds which attack the metal are formed by the action of these brush discharges upon the atmosphere.

### Mines of the High Sierra.

The recent discovery of rich ore in the neighborhood of Bridgeport, Mono county, Cal., has again attracted attention to the mineral resources of that portion of the high Sierra region. In the earlier days of mining in California men of means were less

Small lots of rich ore were taken from Blind Spring and other less prominent districts, but in Lake district the Mammoth Company's mines and mills, located at Pine City and Mammoth City, employed a large force. The company built an expensive road, and in 1878 built a 20-stamp mill, which was increased to forty stamps in 1879. The mine was developed by several tunnels run at various levels. For a time the property made a large output, but the lower tunnels having failed to develop large bodies of high grade ore the work was discontinued and the mill closed down. More or less prospecting with encouraging

Head of the Tuolumne River, Cal., Showing Character of Country on West Slope of the Sierra Nevada Mountains.

Sardine Lake, on the Line of the Tioga Road, Mono County, Cal.

the main Sierras lying to the westward of Bodie. cautious in their investments, and any ore deposit that would afford good assay values looked attractive, and for this reason large investments were made in that region. Among those most prominent were the mines of Homer, Tioga and Lake districts. The most noted district in that section—Mono county—is that about Bodie. The veins in that district occur in andesite and have produced upwards of \$25,000,000 in gold, much of the rock being high grade. The success of several mines of Bodie stimulated the development and equipment of numerous others in that district which proved to be unprofitable. The industry gave, directly and indirectly, employment to a large number of men, and as a natural result prospecting extended upward into

results has been done in the district since. The ores carry gold, silver and lead, and in some instances copper. The bullion is worth usually about \$12 per ounce. In Homer district the principal mine is the May Lundy, which has been extensively developed by tunnels run on the vein. The mine was equipped with stamp mill and a large amount of bullion produced. Recently the tailings have been successfully worked by cyanide process. In Tioga district, south of the Lundy district, the Great Sierra M. Co. owns large interests. The claims have been developed extensively by means of tunnels. Some of the mines are at an altitude of about 10,000 feet. The character of the country in the neighborhood of the mines on the summit of the Sierras is illustrated in the accompanying engravings. Open park-like valleys

are surrounded by rugged snow-clad peaks, in the shadows of some of which are living glaciers, the remnants of a once extensive ice field. In some instances the scenery is grand, great canyons having been cut deep into the rocks by ice and water, and this ruggedness renders the mines easy of attack by means of tunnels. There are numerous glacial lakes, and meadows which were at one time lakes, now filled with sediment. Timber is abundant and water for power and all other purposes is obtainable in almost every ravine and canyon. In addition to the mines and mining districts above mentioned there are

to construct a State highway over the Sierra through the Tioga district, which will make several of these old camps more easily accessible.

## THE PROSPECTOR.

The rock specimens from Kingman, Ariz., are: No. 1, quartz diorite; much altered and effervescing with acid, showing that the lime-soda feldspars are

Needles, Cal., is mountain cork, a variety of asbestos. Other similar minerals are mountain leather, which occurs in sheets, and mountain wood, which has a fibrous appearance resembling dried wood.

The prospector should include in his outfit a pole pick, shovel, small mortar and pestle, hornspoon or small pan, bottles of muriatic and nitric acid, and also ammonia (for testing for silver and copper, also for distinguishing gold from other substances resembling it when in a very fine state of division), also numerous sample sacks and cards and pencil for marking the locality where each rock or sample is obtained. Often a prospector picks up a piece of float and, after glancing at it, puts it in his pocket or in a sack. During the day he may pick up a number of such pieces, depending on his memory to find the place from which any one of them came, if it seems necessary to look it up again. On prospecting the day's harvest of rocks in camp in the evening or the following day, it is discovered that one of them contains valuable mineral. He endeavors to find the place from which the specimen came, but is unable to do so. If the sample had been placed in a sack with proper description on the accompanying card, or merely a number, with the description in the book, there would be no difficulty in rediscovering the place.

The mineral specimens from Forbestown, Cal., are: No. 1, talc schist altered from greenstone (diorite or diabase). This may not be the proper hanging wall. Crosscut, and, if the rock continues soft, drive through it until hard rock or a vein is reached. No. 2 is a splintery, semi-schistose metamorphic rock carrying some pyrite. This rock may be, and probably is, the wall. No. 3 is a semi-schistose rock altered from diorite. It contains a very little extremely fine pyrite. Otherwise it is similar to No. 2. No. 4 is similar to No. 3. Evidently the country is changing for the better at the face of the tunnel. No. 5 is talc schist with a little quartz and considerable pyrite. The latter may be gold bearing. This can be told by assay. No. 6 is felsite, a variety of dike rock, and from explanation given of its occurrence is a "good sign." The little vein should be explored further. No. 7 is quartz with iron sulphide (pyrite) and looks well. A similar ore should be found near No. 2. No. 8 is quartz and pyrite, and No. 9 quartz with galena and a little pyrite. No explanation is given in the diagram of why the offset was made in the tunnel nor why it was again turned back in line with its former direction. If a good body of ore is cut at the face of the tunnel or beyond, the tunnel should be straightened to obviate the two unnecessary turns.

The prospector who starts out on his quest for a mine with a fixed idea of how his mine must look is likely to be disappointed. The secret of successful prospecting lies in casting aside all preconceived notions and to overlook nothing. A few years ago no prospector believed that gold or silver ore would be found in a dike. Now it is known that many dikes carry valuable ores of gold, silver and copper. Many still think that it is useless to look in limestone for a gold mine. The fact is there are numerous valuable gold mines in limestone, and not infrequently limestone or marble contain payable gold. That any particular formation or combination of formations is necessary to the occurrence of good ore is another fallacy. The old miner's expression "gold is where you find it" is a truism that no prospector can afford to forget. As a rule large white quartz croppings do not carry payable values, though there are important exceptions. One of the best indications of a permanent and valuable vein is a soft, decomposed and mineral-stained country rock along the course of the vein, no matter what the character of the rock. The outcrop accompanying veins, large and small, which become great producers of gold, silver, copper, lead and other minerals, usually shows extensive mineralization of the country rock along the course of the vein, and generally the rock has become softened by the decomposition which has taken place at and near the surface. The characteristic features are brown or red iron oxides, soft ground, and honeycombed quartz. Greenstones (diorite, diabase, etc.) are altered to soft yellowish brown rock which can be easily picked. Black slates are bleached nearly white or light yellow, sometimes are stained brown or even red, and are soft and easily picked. Schists become brown or red. Andesites often show kaolinization as well as stains of iron oxide. Black oxide of manganese and iron oxides are the most common signs of the vein proper, as well as the masses of ferruginous quartz. The prospector should be able to recognize an outcrop when he sees one, but such is not always the case. In one instance two men, who discovered a valuable mine, were placer mining below it, and sat on the outcrop of their vein to eat their lunch for several weeks before discovering that the rock was rich in gold.

The height to which water will follow the partial vacuum created by the piston of a pump is theoretically about 33 feet at sea level; but the suction and valves must be almost perfect to secure these results, while at great altitudes it is much less, owing to decreased air pressure.

Camp Curry, Tioga, Cal., Elevation 10,318 Feet.

Levinig Creek, Near Tioga, Cal., Showing Character of Country on East Side of Crest of Sierra Nevada Mountains.

numerous others both north and south of those named, forming a mineral belt which extends along the region near the crest of the Sierra for many miles. Mills have been built, aerial tramways erected and other improvements made, but most of this was at a time when metallurgy had not reached the advanced stage it now occupies. Comparatively little new development or equipment has been made within the past ten years, but within that period a marked advance in metallurgical knowledge has been made, and if it were not for the difficulties of transportation these districts would be active at the present time. The long winter season, with its deep snows and tempestuous weather, has constituted a material drawback to the steady and successful operation of these mines, but steps have been taken

decomposed. No. 2 is a metamorphic schistose to slaty rock, and also shows the presence of much lime. This rock is also probably of eruptive origin.

The mineral specimen from Los Angeles, Cal., is pro-chlorite, and contains no uranium mineral. It has all of the physical properties of the chlorite and few, if any, of uran-mica.

The mineral specimens from Idaho Springs, Colo., are largely composed of garnet, with quartz, and one specimen also shows considerable biotite (black mica), another shows much iron oxide (limonite) with crystallized quartz.

The specimen from Arizona, 8 miles east of

## Mining and Metallurgical Patents.

PATENTS ISSUED JUNE 21, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR SEPARATING MATERIALS OF DIFFERENT GRAVITIES.—No. 762,870; H. A. Allen, Chicago, Ill.

Ore separator in which is combined closed separating vessel, means for introducing thereto materials to be separated, independent sources of liquid and gaseous fluid supplies, independent conduits forming circular systems leading in closed circuits away from and back to separating vessel, means for discharging separated materials while apparatus is in operation, means for independently forcing gaseous and liquid fluid circulations through separating systems and suitable valves for controlling circulations.

MINING AND EXCAVATING APPARATUS.—No. 763,030; C. H. Thompson, Los Angeles, Cal.

In apparatus of class described, combination with track, of car provided with means for directing material from blast into car and retaining such material on car, and means for raising and rigidly supporting car above track to adapt cars to receive impact of loosened material from blast without injury to running gear of car.

STAMP TAPPET AND SECURING MEANS THEREFOR.—No. 763,146; C. Brown, Bishop, and F. Hayes, Elmonte, Cal.

Combination with stamp-stem, of tappet having

central bore to receive stem and having, at one side of bore, inner longitudinally extending chamber with bottom wall 11, upper end of tappet being recessed to communicate with chamber and inner wall of chamber being inclined in direction of length of tappet, inclined wall extending to point below bottom wall 11 to form recess, and bottom wall and corresponding integral portion of top of tappet between recess and bore forming stops or shoulders; gib of such thickness that it is capable of endwise insertion through top of recess of tappet and adapted to enter chamber and occupy space between top and bottom stops, gib and corresponding portion of stem being serrated and adapted to interlock; and single tapering key disposed longitudinally of stem and insertible through top recess of tappet and adapted to lie between inclined wall and back of gib, key having continuous bearing at all points on back of latter and having lower end or point to enter bottom recess.

CLASSIFICATION OF THE METALLIC CONSTITUENTS OF ORES.—No. 763,259; A. E. Cattermole, London, England.

Process of classifying metalliferous minerals agglomerated by oil which consists in successively agitating agglomerated minerals with emulsifying agents of varying strength progressively to free several minerals in succession separating out each mineral in turn by separating device and adding oil in requisite small amounts to keep granules of proper size and consistency.

ORE SEPARATOR.—No. 762,867; H. A. Allen, Chicago, Ill.

Apparatus in which is combined closed receptacle having tapered bottom consisting of plurality of surfaces inclined to plane at right angles to axis of receptacle, inlet pipes projecting through vertical members of stepped portions, means for admitting ore to body of vessel, discharge opening at bottom and one or more discharge openings upon higher level than that at which ore is admitted.

ORE SIZER AND CONCENTRATOR.—No. 763,019; A. H. Phinney, Turner, Mich.

Ore sizer and concentrator comprising vat having discharge element at one end, plurality of hoppers below level of discharge element and forming series of water chambers, and screen forming false bottom extending over hoppers and extending below water level of vat, screen being provided with longitudinally disposed bars spaced apart and having upwardly converging inclined sides, bars forming series of straight guiding channels opening at bottom into hoppers and extending from feed to discharge ends of device.

ORE SLIMER.—No. 763,197; I. F. Monell, Boulder, Colo.

Ore slimer comprising main frame, belt frame supported in main frame, rollers at ends of belt frame, rollers being tapered from centers outward, small rollers arranged between first-named rollers, and tapered from centers outward, endless belt movable over several rollers, and means for distributing stock onto belt, and washer for cleaning values from belt.

ELECTRIC FURNACE.—No. 763,330; C. P. E. Schneider, Le Creusot, France.

In combination, electric furnace chamber, electrodes therein, and means for adjusting same whereby they may be lowered and raised in chamber, pipe leading from and returning to bottom of chamber adapted for circulating molten metal, and transformer linking pipe and adapted to heat molten metal therein.

HYDRAULIC AIR COMPRESSOR.—No. 763,239; J. H. Alexander, Ymir, Canada.

The combination in air-compressing apparatus of pipe for conducting falling column of water under due pressure, and having outlet to atmosphere, separating tank into which pipe discharges, storage tank and supplemental air-compressing mechanism, comprising hydraulic cylinder having piston arranged for operation by water discharged under pressure from separating tank, air cylinder and piston, air piston being connected with piston of hydraulic cylinder for operation thereby, and pipe 6 connecting supplemental air-compressing mechanism and vertical pipe leading to separating tank, whereby air compressed by supplemental mechanism is conveyed into pipe 6 and thus into separating tank.

DURING 1904, in California, the areal geology of the Redding quadrangle will be revised by J. S. Diller. He will also complete an areal and economic survey of the Indian Valley special quadrangle, and A. C. Spencer will co-operate with W. Lindgren in making an investigation of the economic geology of the Redding quadrangle. G. K. Gilbert will continue his investigations of the glaciology and physiography of the high Sierras. In Colorado, under the direction of Whitman Cross, detailed areal mappings will be continued in the San Juan region. The Ouray quadrangle would be surveyed and the work extended as far as possible into the adjoining Lake City quadrangle. The survey of the Engineer Mountain quadrangle will also be completed. Dr. Cross will have the assistance of Ernest Howe, W. H. Emmons and A. Johannsen.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

Niblack reports say ore has been struck in the crosscut on the 150-foot level of the Niblack mine, near Ketchikan. The formation at the lower level corresponds with that 100 feet nearer the surface, except that the ore appears more uniform in character. By next month it is expected the mine will be in position to start shipments to the smelter at the rate of fifty tons per day, and to increase its product as fast as room can be made for an increased force of miners. The company is working forty men.

Foreman J. Perelli of the Alaska-Juneau mine, on Silver Bow Basin, near Juneau, reports the thirty stamps dropping steadily with satisfactory results.

## ARIZONA.

### Cochise County.

Progress is being made in the new Sacramento shaft of the Copper Queen Co. at Bisbee. Sinking is going forward with two shifts of miners. It is expected it will take two years before the shaft will be in shape for adding its quota to the production of the company's mines. Sacramento shaft will, when completed, be of three and one-half compartments, and will be sunk to a depth of 1000 feet before much ore will be taken out. To operate this shaft the company will put in hoisting and other machinery of a large capacity. At present the miners have attained a depth of 50 feet.

### Gila County.

At the Old Dominion mine, at Globe, construction work is progressing. The iron and concrete work on the dust chamber has been finished, and laying 200,000 brick in the side walls has begun. The pump, set up in the new shaft, is in operation. The work of putting in the foundations for ten ore bins above the smelter has been started. The grading for the concentrator, which has been under way for some time, will be finished this week. An addition to the plant that has been decided upon is a machine shop, says Manager L. D. Ricketts, to be located on the railroad spur back of the superintendent's residence. The shop will be constructed of steel and will be larger and better equipped than the present shop. Two of the old furnaces continue in blast.

### Graham County.

It is reported that the New England & Clifton Co. has bought the Julius Lezynsky claims, in Greenlee district, on Chase creek, near Clifton. There are between thirty and forty of these claims, upon some of which development work has been done and concentrating ore opened. This gives the company an outlet on Chase creek. It is said one of these claims has a body of concentrating ore 70 feet in width which averages 4% copper. It is also reported that the New England Co. has a controlling interest in the Antietam mine, near Metcalf.

The Home Co. at Morenci proposes to put down a shaft. It will start on ore on the Will Do claim, in the bottom of a gulch, at one of the most favorable points for development. N. L. Jenkins is superintendent.

### Martinez County.

C. F. Goddard, manager of the Goddard M. Co., whose property is 2 miles north-east of Wickenburg, says he has men working in ore averaging \$12. They have put up a whim on the 90-foot shaft, and will put in a gasoline engine later in the season.

### Mohave County.

The Stockton Hill M. Co. reports that in the crosscut from the 400-foot level of the De la Fontaine mine at Stockton Hill 3 feet of lead ore has been cut. On the tunnel level a shoot of lead ore was opened up in the wall. Milling machinery will be put in.

The Leland M. Co., near Chloride, is dropping ten stamps of the mill on ores from outside mines, the Midnight furnishing a large part of the tonnage.—T. Nay, E. Purcell and J. Thompson have a lease on the east end of the Leland mine and the north end has been leased to other parties. It is stated the mine shows streaks of high-grade ore.

The Gold Giant M. Co. has bought the Homestake mill and will remove it to the Mossback mines, near Chloride, in August. The mill is of twenty stamps. The company is putting in a 12 H. P. hoisting plant on the Mossback mine and intends to sink the shaft to 300 feet, says Manager Slocum.

The Gold Road M. Co., near Acme, is making improvements for its milling plant. One of these is the change from dry to wet milling. Water sufficient for

this purpose has been developed near Little Meadows and by converging the many springs in the canyon south of Little Meadows and establishment of a pumping plant at that point, all the water will be forced over the mountain. As soon as the pipe lines have been laid, it is intended to also pump the oil, which is used as fuel, thus obviating the heavy mountain haul. When these improvements have been made the company intends to put amalgamators in the mill for taking up the heavy gold before the pulp goes to the cyanide tanks.

Men have been put to work on the C. O. D. mine, Stockton hill, on the shaft, says Superintendent Alexander. The shaft will be sunk to tap the vein below the old workings, and will be of two compartments. At the 400-foot level the old shaft stopped. It is thought ore will be opened up on the 400 and 500 levels when the new shaft reaches those points. The old shaft was sunk on east end of the ore body.

S. C. Bagg, of Kingman, manager of the New Comstock mines, near Mohave City, says men have been put to work and will pile ore on the dump of the Katherine mine for a month or more. At present, the Colorado river is too high to admit of operating the mill, the pumps being under 10 feet of water. As soon as the water subsides the mill will be started up.

J. D. Jordan has a contract to run several hundred feet of drifts from the 400-foot level of the Golden Gem mine, at Cerbat, says the Kingman Miner. Work has begun. As soon as these drifts have been carried through the ore bodies another 100 feet will be sunk in the main shaft. J. W. Morgan is superintendent for the company.

H. F. Best, president of the Treasure Hill M. Co., at Stockton Hill, reports the water has been pumped from the shaft of the mine and the crosscut will be run to the veins on the north and south side of the shaft.

### Yavapai County.

The Farwell M. Co. at Zonia, near Kirkland, reports progress. Sinking is going on at rate of 100 feet a month. It is proposed to build a reduction plant.

C. K. Tibbetts, manager of the Pfau G. M. & R. Co., with properties at Cherry, 8 miles southwest of Jerome, says he is preparing to put in a 100-ton cyanide plant, boilers, engines and a compressor plant. The Pfau vein shows a width of 40 feet and carries average values of \$5.50 per ton.

## CALIFORNIA.

### Butte County.

Oroville reports say preliminary work to dredging is under way on the Hearst estate, which has extensive land holdings near Palermo, 6 miles below Oroville and 4 miles from the Feather river. Work is in progress in two different places on one of the Hearst ranches. As a means of prospecting ground to determine its value for dredging, those in charge are sinking shafts and the entire prospecting work will be done by this method if the prospectors do not strike more water than they can handle. Should this occur, the work will be completed by drilling. The work is under supervision of M. Grier.

A prospecting drill has been placed on the eastern part of the Diggs farm, near Oroville, and boring commenced. This is part of the 1200 acres bonded to the Vilora M. Co., an English company, at \$360,000.

### Calaveras County.

At the Royal Con. mine at Hodson chlorination works have been completed with two furnaces. This plant will be sufficient to handle the concentrates from the 120-stamp mill.—Negotiations are in progress with the Union Water Co. to convey water into Hodson, as well as Copperopolis. The Royal mine has the only water right in Hodson at present, pumping the water from the Salt Spring valley reservoir. This is an expensive process, and it is said the Royal is interested with the Mountain King in the new water project.

### Del Norte County.

Quartz locations on Shelly creek, near Crescent City, are being developed. The mineral belt of that section is 3 miles in width and as yet, with the exception of the Monumental mine, no extensive work has been done, says the Del Norte Record. Reports from Shelly creek say the Monumental M. & M. Co. is rushing work on the sawmill getting out lumber for buildings. Thirty men are at work. The work of getting out ore will follow. There is said to be a copper ledge that crosses Smith river near the mouth of Myrtle creek.

### El Dorado County.

(Special Correspondence).—At the River Hill mine, 1½ mile from Placerville, the outlook is reported promising. The shaft is down 1050 feet between the two veins and they are crosscutting from the 300,

400, 500 and 700-foot levels toward either vein. The 2400-foot drainage tunnel, completed six months ago, runs into the 700-foot level and will form an economical means for working and draining the mine. This tunnel is said to have been run at a cost of under \$5 per foot. It cuts several ledges. Most of the waste is being used for filling, although a little is run out through the tunnel. The ore is hoisted and given a coarse crushing at the galows-frame. It is then trammed by gravity 150 feet to the mill by means of a system in which the loaded descending car pulls up the empty ascending one. Here it is crushed finer and fed to the 20-stamp mill. The sulphurets are saved on four Willeyes and the fine tailings from these are caught on Frue vanners. These vanners are a recent installation, the table tailings formerly running to waste. Two more vanners will be put in. It is proposed to build a 40-stamp mill and chlorination works at the mouth of the tunnel. Water under 230-foot head is used as power for the 20-stamp mill, thence it is carried to the mouth of the tunnel, where, under 596-foot head, it runs the compressor furnishing air for hoisting, running coarse crusher and operating machine drills. The reheating of air for hoist and crusher has given 35% increase in efficiency. G. Clark is superintendent and T. Clark manager.

The Rivera gravel mine, near Placerville, is doing considerable development work and running all rock so extracted through their gravel mill. The very coarse gold is caught in the discharge riffles and the finer material is recovered on an amalgamator. The plant is run by water power at 170 pounds pressure.

Placerville, June 29.

(Special Correspondence).—W. T. Bailey has a lease and is working the Eagle King mine.—At Cap's crossing on the north fork of the Cosumnes river, 9 miles from Grizzly Flat, W. Davis has relocated and is working an old gravel mine with six men.

The Contention mine, owned by J. Lyons, is working with eight men. A 2-stamp mill is in operation.—The Morey mine is producing ore and is keeping four stamps dropping.

The Mount Pleasant mine, J. T. Gribble, superintendent, is the chief producer of Grizzly Flat. A new 4x4-foot two-compartment shaft is down 200 feet. This is at the south end of the claim. Twenty men are employed.

Grizzly Flat, June 29.

### Fresno County.

The Kern Trading & Oil Co. (the S. P. oil department) is rushing work on its pipe system, and next week expects to have all S. P. leases at Coalinga from the Commercial to the Union, inclusive, connected up with the receiving station. This will afford a measure of relief to many of the west end operators, as the railroad will take all oil from producing leases. The K. T. & O. Co. is already taking all the production of the Genesee, Section 7, and Penn-Coalinga companies. It is estimated the amount of oil to be received from the leases will approximate 4000 barrels a day. E. W. Allen is local field manager.

### Kern County.

At Randsburg mining is reported improving. The Yellow Aster is working full handed, double shift. The Butte Lode, Sunshine and Baltic are making steady outputs, also the leases in the King Solomon group and Stringer district.

### Mono County.

B. D. Phillips, a prospector of Masonic mountain, 10 miles from Bridgeport, reports finding quartz assaying \$9 per ton. He dug a shaft 20 feet and found a 5-foot ledge of \$25 ore. Prospectors are rushing to the find. J. Sawyer reports having a claim with a 6-foot ledge assaying \$20 on the cropping. The Rough and Ready claim has a 3-foot ledge. The ores are largely free milling. It is hilly country and wood and water are plentiful.

### Nevada County.

The Union G. & S. Con. M. Co. has been incorporated and has started developing the Union mine at Banner Hill, near Nevada City. The board of directors is composed of N. J. Weber, W. H. Dunlap, S. L. Leiter, W. Palmer, W. Black, F. Woodman, S. Hieronimus and P. F. Simonds.

The Conlin mine, near Grass Valley, is reported to have struck the ledge. Under Superintendent Holland's direction a crosscut was started from the 300-foot level.

Experiments having been satisfactory, the North Star M. Co. at Grass Valley is grading for a cyanide plant near the mill at Central shaft. A small sand plant has worked the tailings to some extent below the mill. Superintendent Foote says the experimental cyanide plant has been handling the output of ten stamps, and is operated by a system of agitation. This small plant determined the company on erection of a large one to handle the entire output of the Central shaft 40-stamp

mill. It will be at the edge of the road to the Omaha mine, a short distance below the mill, and the sulphurets will be carried thither by a sluice. To reduce the sulphurets to the required fineness, a Chilian mill will be used, says the Union. The new works will be built of fireproof material. The new 40-stamp mill will be ready for operation this month. Up to the present time the mines in the district have shipped their sulphurets to the smelter or hauled them to the local chlorination works.

Work is under way on the Blue Hill mine in Willow valley, near Nevada City. The machinery of the American Hill mine has been bought by R. Simmons for the Blue Hill Co.—Work at the Union mine, near Banner hill, is being increased. Retimbering the shaft is under way.—G. Coppers is developing his property in New York canyon, near Snow point, during the last few weeks. He reports striking ore that shows free gold.

At the New York-Grass Valley Con. mine, near Grass Valley, Manager Root says underground work is progressing. Between the fifth and sixth levels a shoot has been cut showing free gold. It is intended to drift farther east in No. 6 level to strike the shoot showing in No. 5. Sinking will resume, it being intended to send the shaft down 300 feet farther. Another compressor will be added, increasing the present power one-third.

The Nevada County mine on Deer creek in Nevada City will be reopened and worked. A. Maltman, superintendent of the Murchie mines, has a lease. The incline will be pumped out and sinking resumed. Drifts will also be run south along the ledge. The machinery will be placed in condition and a pipe line will be run to connect with the one that furnishes power for the Sierra Queen mine. On the property is a 10-stamp mill.

### Plumas County.

Superintendent Goodhue says work is progressing satisfactorily at the Five Bears mine in Genesee valley, near Genesee. The grinding mill has been placed in position and the work of putting in the cyanide plant taken up. The tunnel for the development of the ledge is being driven ahead, the showing being reported satisfactory both as to quality and quantity of ore.

The quartz ledge uncovered in the Gold Run hydraulic mine near Elizabethtown, north of Quincy, says C. A. Poage, manager of the Gold Run Co., has been unwatered for 200 feet, the width showing 8 feet. The sluiceway of the gravel mine crosses it diagonally. At that point the ledge is cut to a depth of 8 feet and a distance of 20 feet along the vein. Free gold shows, with pyrite and galena. The ledge dips to the east at an angle of 70°, with slate on the foot and porphyry on the hanging wall.

### San Diego County.

The Stonewall mine near Cuyamaca will resume operations this week. G. H. Clark, formerly of Auburn, Me., is business manager and S. H. Lucas is superintendent. The plan, as outlined by Superintendent Lucas, is the pumping out of the mine and retimbering, and the sinking of the shaft an additional 600 feet. The sawmill will be started getting out the necessary timbers for retimbering the mine.

### San Francisco County.

Plans will be prepared for a parting plant to be built at San Francisco by the American S. & R. Co., says E. B. Braden of Helena, Mont., general Northwestern representative of the American S. & R. Co. The plant will cost approximately \$75,000. It will be for the parting of gold and silver. The plant will handle the bullion of the Northwest and Alaska and a large amount of dore bullion of California.

### Shasta County.

Within the past month the number of miners at the Iron Mountain mine, near Keswick, has been reduced from 400 to 150, says the Redding Searchlight. The reduction in force has been general throughout the property at Iron Mountain. But three men are employed in the quarry where they had twenty-five heretofore. The number of blacksmiths at the mine has been reduced to two. What the company purposes doing has not been given out, but a line has been surveyed and laid out for a railroad from the Hornet mine, owned by the company, around the mountain to the ore bunkers at the Iron Mountain mine. The deposit of copper ore in the Hornet group is reported to be more extensive than the deposit in the Iron Mountain mine, but the ore is lower grade. The ore of the Iron Mountain mine is said to average 7% or 8% in copper, while that of the Hornet mine averages but 4%.

At the Mountain Lion mine, between Shasta and the Mt. Shasta mine, fifteen men are at work. Farnley & Gladwin have been doing development on the

group, and have opened up the mine, showing ore. The mill is nearly completed and will be in operation by August 1st.

#### Sierra County.

It is reported the Columbia mine at American Hill, near Forest City, will be reopened. Manager Harper is at Forest and has given a contract to run 400 feet of tunnel.

The Alleghany M. Co., J. W. Morrill manager, has bought the bond on the Young America group, south of Forest. The Deep Blue M. Co. has started to drift off to the right of the main tunnel. Good gravel is reported in sight.

Operations have resumed at the Columbia gravel mine near American hill, near Forest City, with J. M. Harper of Nevada City as manager. The gravel channel is expected to be reached before the winter sets in, being a distance of 400 feet from the face of the hill.

#### Siskiyou County.

The New York mine on Indian creek near Hooperville, near Fort Jones, is keeping the mill going steadily with 30 men employed. Manager Bryant, operating the Crocker ledge, on Deadwood creek, is building roads from the mine to the west fork of Deadwood, where the mill will be placed. Lumber and machinery are being hauled in.

A. C. Brokaw of Etna, operating Scott valley mines, reports gold-bearing quartz taken from the Advance mine at Russian creek on the Salmon river. The ledge is 4 feet wide. He is running a lower tunnel to strike the ledge deeper. Brokaw is always sinking a shaft in the Hull Gulch quartz mine in Quartz Valley district, the mill being idle awhile, but started a new mill last week on the Golden Eagle in Indian Creek district, where he has a ledge 4 feet in width. J. B. Scott is also running his quartz mill at the New York mine, opposite the Golden Eagle.

#### Trinity County.

The Fairview M. Co., near Minersville, has 125 men on the payroll under Managing Owner J. H. Porter. The mine is equipped with ten stamps, but the company is putting in twenty more stamps. Men are at work on the construction of a ditch which will take water out of Stewart's Fork above the Van Matre farm, and convey it to the site of the power plant to be built by the Fairview M. Co. on the west bank of Trinity river. The mine and mill are on the east bank of the river and power will be transmitted by cable, a distance of 600 feet.

W. H. Christie of San Francisco has an option on the Sykes M. Co. property, the Larsen mine and the Vollmer's ranch at Trinity Center, comprising 1400 acres of gravel, of which 800 acres are dredging ground. A prospecting drill is at work. The drill is run with two shifts, night and day. The Sykes M. Co. report having moved a large amount of gravel this season. Superintendent Payne has started the dredger on the Boyce property for the season's work. He employs six men.

The Cariboo G. M. Co. has started work on its quartz claims on Cariboo mountain, near Trinity Center. They have shipped in supplies and employ about twenty men. They are taking in a stamp mill. At the Yellow Rose of Texas mine the contractors are driving the lower tunnel.

H. Z. Osborne of Los Angeles, at the Dorleska mine, near Dedrick, is preparing for the summer's work. P. A. Wagner has started work on the Wagner quartz mines on Coffee creek. Considerable repair work will have to be done, as a slide took away the mill and did other damage last winter.

P. Peterson and H. Harbine, lessees in the Brown Bear mine at Deadwood, report in six months in the upper workings they have taken out 170 tons of ore which has been run through the Brown Bear mill under supervision of T. Dobler, manager of the Brown Bear property. The ore averaged \$14.30 per ton and yielded \$2500, of which sum they received \$1500, or 60%, the remainder being retained by the Brown Bear Co. as royalty. A number of other lessees have cleaned up their season's work. J. H. Blagrove et al. cleaned up \$2600, while T. Gruss et al. took out \$2300 worth of ore. C. Paulsen and L. Blakemore of Lewiston are getting out \$30 ore. It is understood the Brown Bear Co. will let a number of contracts for drifting in the lower workings. The mill has two 5-stamp batteries.

M. A. Brady and R. E. Cochran of Weaverville, owners in the Lappin, at Deadwood, are pumping water out of the shaft, preparatory to beginning operations. W. Richards et al. are again taking out ore from their mine on Eastman gulch and are getting high-grade free-milling quartz. They have completed reduction of a fifty-ton lot in their small mill which gave returns of \$2500.

#### Tuolumne County.

The Confidence mine at Confidence is being worked full handed. Seventy-three

men are on the payroll. The Kanaka mine, near Groveland, is reported to be in shape for active mining and milling operations. The Soulsby mine at Soulsbyville continues to show payable ore, says the Sonora Democrat. The working force numbers fifty men.

On the 1300 level of the App mine at Quartz a body of ore is reported struck. The vein is 12 feet in width and is supposed to be a junction with the Knox and Boyle vein.

The Calico mine, near Stent, in which a shoot of ore has been found, is being re-timbered and unwatered. R. A. Keller, superintendent, reports that a mill will be built.

The main shaft of the Dutch mine at Quartz is being sunk from the 1400 to the 1550-foot level, while stoping is in progress on several levels, and considerable drifting is being done. Tests have been made to cyanide the pulp as it comes from the amalgamating plates, before going over the concentrators, by which a saving of \$20 is said to be made. It is planned to build a cyanide plant for this purpose, says Manager Trittenbach, and do away with expense of shipping sulphurets.

#### Yuba County.

At Smartsville E. L. Hutchinson of Los Angeles says the Deer Creek, Blue Gravel, Money Flat Hydraulic M. Co., which is incorporated under Arizona laws, has a bond on the Excelsior and Campbell mines, and that they will work them by hydraulicking. C. H. Hill, who has a bond on several properties in the Smartsville district, is associated with them. The mine is at present being worked by drift process. It is intended to build dams at the river at the mouth of the canyon and back the debris up behind it.

### COLORADO.

#### Clear Creek County.

(Special Correspondence).—In northern Clear Creek county, especially Alice and Yankee districts, mining is resuming. Hart Bros. are starting to sink on their property and are putting on a whim. Later, as the ore shows up well in development, they will put on other machinery.

Alice, June 26.

(Special Correspondence).—J. S. Waugh, in charge of the 94 Tunnel M. Co., is getting ready to start up the mill. This plant has the dry concentration process, with capacity of fifty tons per day. He has 2000 feet of development work in the tunnel and the ore runs \$15 per ton. Most of the mine work is done by hand, although they have a compressor.

Over the hill from the 94 in Cumberland gulch are the Cumberland mines, owned and operated by the Yankee Con. M. & M. Co., H. I. Seeman manager. This company has started up the 15-stamp mill. Five more stamps will be added. The mill contains stamps, plates and concentrators. Concentrates are hauled to Idaho Springs for shipment.

Yankee, June 26.

(Special Correspondence).—The Gold Fissure Mining Co. is operating its property near the head of Lyon gulch at North Empire. The mill dirt is treated at the Clear Creek mill.

The Silver Mountain M. & M. Co. group, which has been idle the past year, is being cleaned out and put in shape for operation under management of F. G. Bishopp. The shaft is 500 feet in depth. The last three years the mine was operated it produced \$150,000. The shaft is connected with the Empress tunnel. The mine is equipped with 7x10 double hoist, 60 H. P. boiler and 25 H. P. electric plant for lighting purposes and operating power drills. The mine is located on Silver mountain. The Clear Creek mill, which is owned and operated by the same company, is at the junction of the middle and south branches of Clear creek, near the station on the Colorado & Southern Railway. They have a power plant at the mill capable of developing 167 H. P. The mill contains crusher, rolls, jigs, Huntington mill, vanners and concentrator. It has a capacity of thirty-five tons per day. The mill is running steadily on ore from the Gold Fissure and Empire Tunnel Co. ores.

The Empire Tunnel Co.'s strike on the sixth level of the Empress is showing up satisfactorily. The vein is 4 feet wide. This company has been doing mostly development work and not shipping much ore. The ore which is being shipped runs three ounces in gold per ton and the mill dirt averages \$10 per ton. By July 15 they expect to be in position to ship a heavier tonnage. Electric drills are in use in the mine. D. Ward is foreman at the Empress.

P. G. Lundh of Lamartine has just completed 100-foot contract in the Marshall-Russell tunnel. The tunnel is in 600 feet.

Empire, June 26.

(Special Correspondence).—About 1 mile from the forks of Fall river and

Clear creek the Lucania T. T. M. & D. Co. is driving a tunnel through Bellevue mountain for drainage as well as for transportation. When finished it will connect with the mines of Russell Gulch and vicinity. It is in 1000 feet and driving at the rate of 25 feet per week. J. McColl is superintendent.

The Golconda tunnel, 5 miles from Idaho Springs, on Fall river, is being made ready for operations. Superintendent A. L. Drake is putting in a 4-drill compressor and expects to start up next week. This company has a 10-stamp mill on the property, but it will not be put in commission at present. The tunnel is in 750 feet and will be extended. The Buffalo & St. Louis M. & M. Co. are owners and operators.

Idaho Springs, June 27.

(Special Correspondence).—At the Pelican-Dives mine an electric drill is being operated by the students at work there. There is said to be about 20 miles of underground workings on the property of this company. Tests are being made with a view of putting in a mill at the mine. Ore is being shipped to the mill at Dumont. The ore carries gold, silver and lead. J. Glasson is foreman at the Pelican and H. Sidney foreman at the 7-30 mine, and O. O. McReynolds is superintendent of the group.

Stevens & McGrath have a lease on the Mendota mine and mill. They are shipping 200 tons of concentrates per month and working 23 men. The tunnel is 1250 feet in length and the shaft from the tunnel level is 400 feet deep. All ore from the shaft is taken out through the tunnel. The mill has a capacity of 60 tons per day.

The Terrible mines, under management of B. C. Catren, are producing steadily. The mill has been put in shape for handling the ore from the mine.

Silver Plume, June 27.

(Special Correspondence).—The mining industry in upper Clear Creek county is improving. Recent strikes in a number of the properties have given mining renewed activity. Besides the strikes in the mines, there is a possibility of new railroads being built in the section, as well as one or two mills. The Board of Mines and Commerce at Georgetown has issued a pamphlet setting forth the advantages of upper Clear Creek. While the mines of this district have been noted for silver, yet gold is also found, particularly in the Centennial mine in Georgetown, and at Silver Plume all of the mines carry some gold.

The Vidler tunnel on McClelland mountain, R. C. Vidler manager, is in 500 feet and has cut six veins. They have a large body of low-grade ore which averages \$10 per ton. They are cutting another vein and are preparing to put in a power plant. The Harris mine, on the line of the tunnel, is shipping high-grade silver ore.

There are three different lessees shipping ore from the Sunburst mine of the Red Oak Co. on Democrat mountain. The strike which was recently made in the Scepter mine of this company is reported showing a better grade of ore than was at first cut in the tunnel.

G. W. Teagarden, manager of the St. Paul M. Co., is getting the mine in shape to put a larger number of men at work. He will operate through four tunnels. Electric drills will be put in.

The repairs which were being made on the Centennial G. M. Co.'s mill were held up during the absence of Manager D. Kennedy. Since his return from the East work has been resumed. He will increase the capacity of the mill by adding Huntingtons or other machinery. The output from the mine is curtailed waiting completion of the mill. He is doing timber work in the mine. Some of the ore has high-grade gold values.

Manager W. Cooper of the Capital Prize mine is still using hand drills, but will change to power drills this summer. The Kelly tunnel, closed some time ago, is still shut down.

Georgetown, June 27.

(Special Correspondence).—The mining business in Idaho Springs section is showing up satisfactorily. Nearly all the mills are in operation and receiving all the ore they can handle from the mines in Clear Creek and Gilpin counties. T. B. Crow, manager of the Alpine Con. G. & S. M. Co., states his 100-ton mill is running steadily. Most of the ore is coming from Silver Plume, although he receives ore from the Old Town mine at Russell gulch, Lillian, Big Five, Centurian and old Freeland mines. The mill is equipped with Huntingtons, jigs, tables, slime tanks, vanners and sizers. He is making a lead and zinc separation from the Silver Plume ores.

The Waltham Co., on Chicago creek, has been operating its 10-stamp mill the past month. A grinding mill is being put in. W. Boardman, who has charge of the construction work of the 60-ton concentrating mill of the Hudson Reduction

Co., expects to have the same in operation by July 10.

The K. R. S. Co.'s slimes plant is preparing to handle the tailings from the Jackson concentrator and the old Newton mill. They are handling tailings from the Newton annex. They expect also to handle the material from the Hudson mill when it is running. The tailings are first elevated to height of 25 feet by two elevators and run into a sizer. The coarse stuff goes to a concentrating table and the fines run onto twenty-four canvas tables. The concentrates from the canvas tables are elevated to settlers and from the settlers run to a mixer and from the mixer to vanners. The final product is shipped. The plant has a capacity of 200 tons per day. W. P. Thomas has charge of the plant. The Bonieta mill is being enlarged, as the capacity of the plant was inadequate to handle the amount of ore received.

J. E. Spurr of the U. S. Geological Survey is expected to arrive in Idaho Springs in the next fifteen days to take charge of the work being done in the district by the department. S. H. Ball of the Survey is on the ground with several men looking after the work. It is stated they will complete three quadrangles. A year ago they mapped the topography of the district and they are now working on the geology. Idaho Springs, June 28.

#### Custer County.

The Bassick G. M. Co., near Rosita, will rebuild its mill that was burned two months ago, at a cost of \$50,000, and the Little Jim M. & L. Co. has completed arrangements for La Rand mill on Grape creek, east of the Rio Grande depot at Westcliffe. The mill will handle forty tons of ore per day, and it is intended to start working this week on the low-grade ore that has been struck and of which there are 1000 tons on the dump averaging \$14 to the ton.

#### Fremont County.

The Denver M., M. & Dev. Co. has awarded a contract for construction of a 50x100-foot slimes department to the main mill and work has been started. This makes the third extension of the Dorcas plant at Florence since it was built, four years ago. Having closed contracts for high-grade Cripple Creek ore, the addition must be finished before September. With the completion of another addition, under contemplation, the capacity of the plant will be doubled. The Colorado L., T. & M. Co., owners of the Florence mill, reports the company's mill at Florence running full blast after an eight years' idleness.

#### Lake County.

Up Little Frying Pan creek, on the slope of Sugar Loaf mountain, near Leadville, ore is being taken out from the Golden Curry and other properties and result of the discovery is being manifested in the activity in properties on all sides of the Golden Curry. Three properties are being worked and ore is being taken from all of them. In addition to these there is a great deal of prospecting being done. As a result of the discovery in the Golden Curry, work will be resumed on the Welsh shaft, which is down the gulch from the Golden Curry and below the Venture. Three lessees have taken charge of the Welsh and are placing machinery at the shaft. The Venture, which is being operated by Superintendent Stacy, is between the Welsh and the Golden Curry. The tunnel has been driven in and a body of ore carrying sulphurets has been opened up. The extent of the ore body has not yet been determined, but twenty tons of the mineral of fair grade have been taken out and is in the bins at the mouth of the tunnel. The Tiger, above the Golden Curry, is being steadily operated.

#### Teller County.

R. H. Atchison, who has a lease on the Spicer mine at Victor, has completed placing a plant of machinery. The main shaft has been sunk to a depth of 400 feet and 1000 feet of lateral work done. The mine has been closed down since the Victor fire in August, 1899. It will require considerable preliminary work before the mine is in condition to be worked at a profit, says Manager Thompson, who is straightening and building up the collar of the shaft. After the present improvements are made crosscutting will be started at a depth of 500 feet.

The Cripple Creek Gold Temple Co., operating under lease the Gold Sovereign property on Bull hill, Cripple Creek, is sending out shipments and will increase production. There are forty men at work, nearly all employed in timbering the stopes and drifts and relining the shafts. When this work is finished the property will be in condition for larger production. The Short Line spur has been built to the mine and ore will be sent out at the rate of fifty tons per day. The ore is reported to return values of \$40 to the ton.

J. Sears of Goldfield has a bond and lease on the Joe Ann mine, between the

Easter Bell and Victor, on Bull hill, at Victor. The Joe Ann property embraces twenty acres. The bond is for \$75,000 and is for two years. Sears has put in machinery. There are two shafts. One is 160 feet and the other 200 feet in depth. The machinery has been placed over the 160-foot hole. At its bottom is a vein 4 feet in width. Mill runs give returns of \$10 gold per ton.

## IDAHO.

### Blaine County.

Operations are resumed at the Hattie group of mines, on the Hailey gold belt, near Hailey. The Hattie mine is being pumped and the drifts cleaned out. Superintendent Wadley, of the Cambridge Placer M. Co., operating on the Little Smoky, reports taking out gold from his claims. With six men he expects to hydraulic 4000 yards of gravel per day of twenty-four hours. He expects to have all the water he can use for the next six weeks.

T. Brennan has bought the I. E. Rockwell interests in the Idaho Democrat group of the Della Mountain M. Co., near Hailey, and has taken charge as manager, with intention of increasing developments. A tunnel was started, to be 3300 feet long, and to afford backs of 500 feet. It still lacks 200 feet of reaching the ledge.

### Boise County.

N. J. Sorensen of Sumpter, Or., manager of the Friday mine, at Pearl, says the stamp mill in course of erection will be started up this week.

### Custer County.

O. McGuinty and R. Moore are working the tunnel in the McGuinty group, 4 miles southwest of Mackay, and have struck the first ore body. They have crosscut that, and are driving ahead to tap the main body which crops for width of 90 feet on surface. They have ore on the dump, and will put teams to work hauling to the smelter before this season is over. Superintendent Fitzgerald has resumed operations on the Alder Creek tunnel, driving through a body of lime to cut a ledge of copper ore in a contact of lime and granite. This is 8 miles southwest of Mackay.

Foundations are completed for another blowing engine at the White Knob C. Co. at Mackay. It is being set up for use in case of an accident to the other one. The copper output of the White Knob C. Co. for month of May was 427,500 pounds of copper. The entire State produced during 1902 but 227,500 pounds of copper, says the Telegraph.

### Idaho County.

G. B. Holleran, of Boise, has at Johnson creek, Warm Lake district, started work on the W. A. White and Sunshine groups of claims of which he is managing owner, says the Boise Statesman.

Secretary Lybrook of the Rainbow G. M. Co. says a mill will be put on the company's property on Monumental creek, near Roosevelt, as soon as the wagon road is completed. The company is composed of Charlotte, Nashville and Battle Creek, Mich., men and owns the Harrisburg group. G. Wertz, of Boise, is manager.

Hump reports say a strike has been made in the Atlas mine. A body of high-grade free milling ore has been broken into 80 feet from the shaft in the lower tunnel. The Trilby and Whistler are said to be showing a vein of 11 feet, while the vein of the Majestic, owned by E. Feltham, is 17 feet in width. These claims are 4½ miles south of Hump.

R. W. Purdum and E. H. Dewey of Nampa are preparing to put in a grinding mill for the Sunnyside mine, at Thunder mountain, of sixty tons capacity, to add to the 40-stamp mill. Much of the machinery has been shipped in for construction of a double-wire tramway, 1½ mile in length, to connect the mine with the reduction plant on Marble creek. The tramway will have a capacity for 400 tons daily. Six mills are to be built this year in the Thunder mountain and Big creek sections, near Roosevelt, says Purdum. C. J. Perkins of New York, owning the H. Y. and Climax properties, south of the Sunnyside, is arranging for a 20-stamp mill. L. C. Van Riper has shipped two mills, one of thirty stamps and one of twenty stamps, for properties in the Big creek country. On both of these properties development work has been done to an extent that large ore bodies are ready for the mill. G. W. Snow of Nampa has shipped a 10-stamp mill for Thunderbolt mountain, 60 miles south of Thunder mountain, on the new State wagon road.

W. A. Douglas, superintendent of the South Dewey M. Co. at Thunder mountain, at Roosevelt, says he is putting men to work resuming development. The company owns ten claims and there have been 600 feet of development work done, showing ore. It is intended to open up the ore bodies by tunneling and sinking.

The company has planned to put in a mill this year.

### Owyhee County.

At the Trade Dollar Extension mine, near Silver City, work is progressing. They are driving into Florida mountain to tap a ledge and 700 feet of the main tunnel has been made since last fall. It is thought within the next 200 feet ore will be struck. An electrically driven air compressor 3200 feet down the hill furnishes power for the machine drills and ventilation. Drills, pipe, rails and cars have been added to the equipment. A. Boundy is superintendent. In the face of a drift, run on a quartz seam, which is in 100 feet from the main tunnel, there are 2 feet of ledge matter which runs thirty-five ounces in silver and \$5 in gold. With three 8-hour shifts they are advancing from 35 to 50 feet each week in the main tunnel.

### Shoshone County.

All mining at the Hercules mine, near Burke, is being done in the upper tunnel. In the lower tunnel, the narrow-gauge track for the mine cars is being torn up, and the company will put in a trolley system with larger cars. The trolley equipment is on the ground. The power plant, recently completed, is reported working satisfactorily and the tunnel is lighted by electricity. The power for the trolley system will be furnished by the same plant. The lower tunnel is 500 feet below the upper and connected with it by a three-compartment raise. When the trolley system is completed the ore will all be taken out through the lower tunnel. The tunnels are in 3000 feet each. The upper one is being driven ahead for the upper side of the mountain, where the company owns timber. The plan is to cut the timber on the other side of the mountain and take it through the tunnel for use in the mine. This will save the expense of hauling timbers up the hill. In time it is expected the Hercules company will drive a tunnel to the property from Burke, a distance of 1½ mile. A right of way has been secured for a tunnel through the ground owned by the St. Louis & Idaho M. Co., and the Hercules owners have a millsite at Burke. The Moonlight mine adjoins the Hercules and the owners say they have the Hercules lead. The Humming Bird is closed. In Canyon creek, it is said, there were 1000 miners at work, of whom 800 are working in dividend paying mines and 200 on prospects.

At the Hecla mine, at Burke, steam power has been supplanted by electricity, which is transmitted 100 miles. The pumps are electrically operated and all the ore is mined and transported by electricity, requiring a total of 220 H. P.

The Independence Con. M. Co. has transferred its properties to A. Paulsen. The group includes four claims and a fraction in the Hunter mining district, between the Morning and the Gold Hunter mines, north of Mullan.

At Osburn work has started on the Evolution mine, the shaft house of which was destroyed by fire. Most of the machinery can be used again after a few repairs. Ore has been cut in the bottom of the shaft, but it will be necessary to sink 100 feet farther before the main body of ore is opened. The ore carries values in silver and lead, with traces of copper and gold.

### Washington County.

Work is under way on the excavation on the site for the Ladd Metals Co.'s 60-ton smelter at Landore in the Seven Devils district, near Mineral. It is expected to have the plant in operation by Nov. 1. The company will do custom work in addition to handling its own ore. Ore buying will begin Aug. 1.

## KANSAS.

Chanute reports say the present tankage of the Standard Oil Co. in the Kansas and Indian Territory oil fields, with a storage capacity for 3,000,000 barrels of crude oil, will be increased to 10,000,000 barrels as fast as the tanks can be built. In the meantime no move will be made toward increasing the refining capacity, except that the Kansas City refinery will be completed to handle 4500 barrels of crude oil daily. This gives a refining capacity to Neodesha and Kansas City combined of 7000 barrels of crude oil daily. The field is producing 15,000 barrels of oil daily. It is given out that there is no home market for more refined oil than is now being produced, and if the field at the end of two years is holding up and producing as much crude oil as at present, a pipe line will be built either to the Gulf or to Whiting. Refined oil cannot be piped nor shipped so cheaply as crude oil.

Chanute reports to the Daily Mining Record say during month of May in the Kansas oil fields 227 wells were completed, the new production was 5958 barrels and the dry holes numbered 43. Compared with April, there was a gain of 7 completed wells and 17 dusters, with a loss of

736 barrels in production. At close of May there were 64 rigs and 152 wells drilling in Kansas, as compared with 55 rigs and 176 wells drilling at close of April. There were 2556 producing wells in the Kansas fields on May 25. In the principal oil producing Eastern States, the new wells for May summed up as follows:

State.	Wells Completed.	Pro- duction.	Dry.
New York.....	6	218	5
Pennsylvania.....	312	1,204	51
West Virginia.....	188	2,863	61
Southeast Ohio.....	202	1,832	69
Northwest Ohio.....	213	2,424	30
Indiana.....	305	4,571	46
Kentucky.....	39	1,604	6
Kansas.....	227	5,958	13
Totals.....	1,523	21,004	310
Totals April.....	1,450	20,361	284

### Cherokee County.

At Baxter Springs the Sunny Side mill is running steadily and turning out jack. The Dark Horse M. Co. has its derrick up and its steam hoist in place. The Ford, Troupe & Co. mill, on the Gaines-Brewster lease, is in operation.

Two or three shafts will be started this month on the Gaines & Thompson lease, near Baxter Springs, where ore has been found by drilling. An Omaha company is reported figuring on developing another forty acres of the Gaines-Brewster lease. D. B. Perkins has his shaft down nearly to the ore body.

Ruby & Co. of Joplin, Mo., have leased the Tom Clark diggings, near Baxter Springs, and will increase development. The Grace Hill M. Co. has started drilling.

Adams & Co. on the South Side at Galena are pumping water. The underground men were driven out by water, and so far have been unable to work the holdings. The Black Jack mill on the South Side M. Co. lease has ceased operations for the present on account of shortage of dirt.

A shaft is being sunk on the ground of the Galena Dev. Co. at Cave Springs. A drill hole struck ore there. The Merchants' M. Co. is pumping the water from the Boston & Missouri M. Co. ground at Cave Springs. The water is down 90 feet and it is expected to pump the 180-foot level dry, when the lots and mill will be leased.

Basse & Co., on the North Empire lease, near Galena, have suspended operations until arrangements can be made for water to clean the dirt. The shutting down of the Wilkes pumps caused the shortage of water. The tramways leading from shafts 1, 2 and 3 to the mill on the Pittsburg-Crowe lease have been completed and the work of transferring the dirt from the shafts will start this week. The pump on the Pittsburg-Bonanza mine has been removed to the adjoining lot on account of a richer strike of ore in the west shaft which necessitates the combined efforts of the pumps to hold the water in check, says the News-Herald.

## MICHIGAN.

### Houghton County.

Houghton reports say the Atlantic mine, southwest of Houghton, was closed down last week and 700 men are idle, because of a strike of 120 trammers, who objected to one of the underground bosses.

## MISSOURI.

### Jasper County.

In Webb City and Cartersville district the tailings mill on the Aylor land has started operations. The mill will be known as the Great Scott and will handle the tailings and slimes from the Lucky Budge, Holy Smoke, Avondale and Old Dominion mines, says Manager Durby. Gates & Nail, mining at Four Corners, west of Webb City, have completed their shaft east of the crusher platform and have found the run of lead ore which they have been working from their south shaft. The run of ore found in the shaft is 80 feet from the head of the drift.

The shaft being sunk by A. Bendalari & Co., on the Guinn land near Webb City, is progressing and is down 172 feet. Water has been struck and a small pump placed in the shaft. The top of the sheet run of ore will be cut in about 10 feet. The Chicago L. & Z. Co., on the Guinn land, has completed its mill and will be ready to clean ore this month.

G. Hubbard, manager for Forristall & O'Donald leases, near Webb City, has started his mill. J. W. Durby has bought the interests of his partners in the Venturer lease and mill. Stepp & Kaiser have shut down their mill on the Guinn land temporarily to put in a larger air compressor. The compressor in use would not furnish enough air to do the drilling necessary to keep the mill in operation.

The Carthage L. & Z. M. Co. is sinking a shaft on the Palmer land, north of Carthage, and is down 86 feet and reports promising indications. Manager J. Gray has put in a steam hoist. They expect to

make a strike at the 113-foot level, as a prospect drill hole showed a face of ore at that depth.

## MONTANA.

### Deer Lodge County.

Arrangements have all been made for building a 50-ton concentrator at the Emery mine, 8 miles east of Deer Lodge, and the plant is expected to be in operation by September.

### Flathead County.

R. Gregg of Troy, superintendent of the Great Northwest silver and lead mines in the Grouse mountain district, says in the main tunnel they have struck the ledge at a depth of 125 feet, the ledge showing 7 feet wide with values of \$45 a ton. Four men have been drifting on the ledge, but sinking from the tunnel has been started. They will sink 50 feet without machinery. The matter of incorporating is under consideration. The mine is 14 miles from Troy and is near the B. & B. mine, owned by Larson & Greenough. The Diamond Hitch mine, controlled by A. B. Raitton of Spokane, Wash., is idle, but work will be resumed. The Diamond Hitch is 3 miles from the Great Northwest and is supposed to be on the same lead, but the ore carries copper and gold. The B. & B., owned by Larson & Greenough, has been closed down since August last, due to a disagreement with the minority stockholders. J. Talkey of Troy is running a tunnel to tap the lead on the Silver Tip mine.

The copper strike on Callahan creek is 10 miles beyond the B. & B. mine, which is 6 miles southwest of Troy. A wagon road runs to the B. & B. mine. Prospectors are going into the district.

### Madison County.

The Shafter M. Co. has been incorporated to operate mining properties in Madison county. The company will maintain offices at Virginia City, Mont., and at Grand Forks, N. D. The directors are W. A. Currie, G. Salisbury and E. T. Spafford, of Grand Forks, N. D.

The Revenue G. M. Co., which is operating the Revenue mine on Richmond Flats, near Norris, is laying the 4 miles of pipe line which will be used to supply water for the cyanide mill. The ditch is finished, and the pipe line is expected to be completed next week. The work is under J. M. Harper, of Butte. The pipe is of wood, wire bound, with an inside diameter of 5 inches. Water in sufficient quantity to supply the mill at all seasons of the year has been secured. The mill building, which is 81x52 feet, with additions for boiler rooms, etc., is going up rapidly. R. C. Knox is superintendent of the Revenue company. It is intended to have the mill in operation by fall.

## NEVADA.

### Esmeralda County.

The January mine at Goldfields is reported showing improvement and sinking is being increased, as the steam hoist is working. To date the mine has shipped 505 tons, of net value of \$55,431.34, the last smelter returns for thirty-seven tons being \$675.75 net. There is reported in transit \$60,000 worth of ore and 7000 tons on the dump worth \$35 per ton. On the Sweeney lease on the Florence mine the gasoline hoist has been put in operation and ore will be shipped.

### Lincoln County.

A strike of ore is reported at the Point mines, 4 miles west of Pioche, which have been worked by the Pioche Nevada M. Co., with C. E. Rives superintendent, under a bond, says the Pioche Record. The vein appears to be vertical, the other veins in that section being more or less flat. It is a contact between limestone on the east and shale on the west. The filling is 7 feet of quartz, carrying galena. The strike of the vein is southeast.

C. Fournier of Rossland, B. C., at Muddy Peak, near Moapa, has an option on four free gold-bearing claims for \$20,000. He has had men working on these claims for the last two months taking out ore and sampling to ledges. He will put in a mill. The group is 14 miles south of Moapa Summit, on the San Pedro right of way, half way between the Muddy river and Las Vegas ranch. Barrett & Smith, owners of the Bald Eagle group of gold-copper mines, 18 miles northwest from Moapa, have taken in a complete mining outfit for their men working on the claims. Assays of ore show returns of \$16 gold and 2½ copper.

Reports from Panaca mine, at Chief district, near Pioche, show the shaft has reached 300 feet, with drifts north and south along the vein, in ore with gold values. The shaft is as deep as it can be made with present appliances, and work has been suspended pending increase of equipment, says the Pioche Record.

The Good Hope M. & M. Co. has taken hold of the Good Hope group of mines, near Searchlight. F. F. Oster of San

Bernardino, Cal., is president. The Quartette group is parallel and adjoining on the south, and on the north is the Duplex property. The company has resumed operations. Two shifts are driving a west drift on the 400-foot level. This drift is being run to reach a shoot of ore from which, in the prospect shaft, a shipment of high-grade ore was made to the mill at Barstow.

#### Lyon County.

W. D. Davidson, who with M. Lockwood owns the Crabb mine, south of Yerington, is putting in a small stamp mill. The mine is reported showing up a body of fair-grade ore. The mill is of two stamps, with triple discharge, and concentrating equipment. It will be run by water power. The ore will have to be hauled a few miles.

#### Nye County.

The Tonopah & California M. Co. will resume operations at Tonopah on completion of the railroad. At the Little Tonopah mine, the shaft being sunk by the Tonopah Geodetic Co. is down 500 feet and satisfactory progress is reported. S. A. Knapp, manager of the Ohio-Tonopah, says work at the mine will be resumed this week.

Development work has been started by E. G. Wheeler on four claims of the Milwaukee-Tonopah M. Co. ground, 6 miles north of Tonopah, near the Ray road. At the Tonopah Extension mine the west drifts are in ore, but work will not be increased until the 10-drill compressor plant has been set up. A 125 H. P. boiler will be added, which will make the total 190 H. P.

The Arivada M. & M. Co., incorporated last year, will start operations this month. The company owns a group of seven claims 60 miles north of Tonopah, on the west slope of the Jefferson range. A shaft has been sunk 140 feet, and 600 tons of ore shipped by the original owners netted \$100 per ton, says the Bonanza. The vein has since been opened up on the surface for 2000 feet, showing values. W. Rodgers is president and J. S. Cook secretary.

The Tonopah M. M. & Dev. Co. mill at Tonopah is running on ore from Lease No. 1, owned by Cutting, Edwards and Douglass. The clean-up of the crushing from the Douglass, Stewart and McQuillan lease on the Valley View is reported satisfactory, from 85% to 87% of values having been recovered.

The Jim Butler M. Co. has bought the property of the Tonopah and Salt Lake M. Co., consisting of the Stone Cabin and Wandering Boy claims, at Tonopah. This transfer was the final step in a consolidation bringing together under one management all the properties of the Gold Hill, Salt Lake, Fraction and Tonopah City companies, and a number of individual claims contiguous to these properties. J. W. Brock is president and C. A. Heller secretary. F. A. Keith, manager and superintendent of the Tonopah Co., will have direct supervision of the operations of the new company. The Jim Butler Co. has leased the Valley View shaft from the Tonopah Co., and work has begun through that shaft. The holdings of the company embrace 300 acres of mineral ground adjoining the Valley View on the east, south and west. The Valley View ledge is said to extend through the Stone Cabin. There are other ledges south of the Valley View and parallel with it which are expected to be cut in the Stone Cabin and Wandering Boy, the Gold Hill claims, and the Fraction property. One of these ledges will be selected and drifted on in both directions. The principal development work will be done on the 500-foot level. The consolidation of the Salt Lake property by the Jim Butler Co. ended the litigation which had been pending for two years between the Salt Lake Co. and the Tonopah Co.

A consolidation in the Ray district, north of Tonopah, has been effected by J. L. Makeever of Makeever Bros. of New York, N. Y., and Chicago, Ill., combining the Ray-Tonopah G. M. Co. and the Ray & O'Brien G. M. Co., under title of the Ray Con. G. M. Co. The Ray Con. M. Co. acquires eight claims of the Ray-Tonopah Co. and five claims of the Ray & O'Brien Co., being the discovery locations in that district, the whole comprising 260 contiguous acres. On the Ray-Tonopah mine, Manager Makeever has 1100 feet of development work done at a cost of \$17,500, including equipment and machinery, and there are ore bodies blocked out on the 225 and 160-foot levels to surface that average \$40 per ton in lead, silver and gold, besides ore on the lump. On the Ray & O'Brien 1500 feet of work have been done, two shafts having been sunk to depths of 300 and 225 feet with drifts on the 160, 225 and 300-foot levels; the vein is said to be a contact between lime and porphyry varying from 3 to 7 feet in width values in lead, silver and gold. The 12 H. P. gasoline hoist will be removed from the Ray-Tonopah

to the Ray & O'Brien mine and the shaft will be sunk to the 500-foot level, while stopping on the 160 and 225 levels will be continued, from which high-grade sand carbonate of lead is being extracted and first shipments will be sent out. At the Ray-Tonopah a whim will be used while a crosscut is being run east on the 160-foot level to a ledge which was cut by the shaft but dipped away at an angle of 65°. Three carloads of ore from this mine are ready for shipment, awaiting teams. Manager Makeever proposes putting in a heavier hoist and a concentrating mill. Coal and crude oil for fuel will be available on completion of the railroad and water will be obtainable from Rye Patch pipe line or wells in the neighborhood.

### NEW MEXICO.

#### Grant County.

Manager C. S. Laughren at Silver City has arranged for a complete machine shop and foundry for the Comanche smelter. In the outfit are lathes, planers, drill press, pipe machine, bolt cutters, etc. H. W. Edwards of Grand Junction, Colo., will be superintendent of the plant.

#### Lincoln County.

The Jicarilla M. & R. Co. has made foundations for its concentrator at Jicarilla. The mill will have a capacity of fifty tons per day. The engines will be 80 H. P. and the boiler 125 H. P. Shafting will be put up for a 100-ton plant so as to be in position when the mill is enlarged. The Free Milling Co. at Jicarilla reports satisfactory results from its placer machine that it is running.

#### Rio Arriba County.

The Bromide district is 20 miles south of the Colorado border and 14 miles west of Tres Piedras, and has 200 inhabitants, mostly engaged in mining and prospecting, says A. Royal of Pueblo, Colo., who is operating there. The altitude is 9500 to 10,000 feet. A good wagon road connects it with the railway station. The mineral belt is 10 miles long by 6 miles wide. The workable veins, nearly all in schist, vary from 2 to 12 feet in width, carrying sulphides of copper, with gold and silver values. There are no reduction works in the district. The bulk of the mineral must be concentrated to render it marketable. It costs \$3.50 per ton to haul by wagon to Tres Piedras, and the railway charge to Pueblo is \$4 per ton. The deepest shaft in the district is 250 feet deep. Others range between prospect pits and 100 feet. There is no coal, but abundant timber, with sufficient water for milling purposes. If a productive camp is established at Bromide, there are points between Antonito and Tres Piedras from which a spur of the Rio Grande railway may be built over easy grades. The distance would be less than 30 miles. The principal property is the Bromide group, on which a shaft has been sunk 150 feet. The company is running a crosscut tunnel to intersect the vein at a depth of 400 feet. It is in 400 feet and has 300 feet to go before it will strike the objective point. The manager is working one electric drill. The principals are Philadelphia, Mo.—A. Royal is manager of the Belle Royal M. & M. Co., whose shaft is down 100 feet on the Whale mine. The vein matter is 6 feet wide between walls and carries an average of \$60 per ton in gold, silver and copper. The company owns eighty acres of mining ground.—A Milwaukee company is operating a property called the Tusas Peak. The shaft is 250 feet deep and is in ore. Manager F. Balton has let a contract to send the shaft down to 500 feet. The vein is 4 to 6 feet wide. Two carloads of the ore were shipped to Denver, Colo., for testing, with satisfactory results. The company proposes building a concentrating mill. It has a good surface plant and is working steam drills. The Strawberry mine has a well-equipped plant, with air drills. Its shaft is 150 feet deep, and there are several drifts from it. The St. Michael also has machinery and is engaged in development work. The Pennsylvania M. Co. properties are being developed by Manager F. P. Elliott.

#### San Miguel County.

The Las Vegas Optic says in the Tecolote copper district work is being pushed on the Elliott C. M. Co. mill preparatory to making another test run. Lumber and other supplies have been taken to the district. The parties at work have options on all the copper properties of the district.

#### Santa Fe County.

J. Martin reports opening up a turquoise prospect near Cerrillos.

#### Socorro County.

Development work on Colorado mines Nos. 1, 2, 3 and 4 at Estey City, owned by the Dividend M. Co., is being increased. The ore is a carbonate and will be treated by leaching and precipitation. The mill is nearing completion. The machinery includes two 125 H. P. boilers and four engines ranging from 30 to 125 H. P. The

crushers, dynamos and blowers are on the ground. The crusher has a daily capacity of 200 tons, while the mill and the smelter will handle 250 tons daily. A 90,000-gallon storage tank, a laboratory and an assay office have been built. A contract has been let to drill a deep well.—Men are at work on the Mocking Bird claim at Estey City.

For the first time in twenty years Cooney creek in the Mogollon district is reported dry and the Cooney mill at Mogollon had to close down for lack of water. The Last Chance mill continues running, although its water supply is also short.

The Socorro Chieftain says five carloads is the average amount of zinc carbonate ore being brought down from the Magdalena district daily. To mine and handle this ore keeps 100 men at work. The mines at Kelly give employment to 150 men. The Kelly is working two shifts a day, and the Graphic is shipping 1000 tons a month.

### OREGON.

#### Baker County.

R. N. Jackson of Spokane, Wash., president and manager of the Fortune M. & M. Co., has opened operations for the season on the Humboldt mine near Greenhorn. The sawmill is on the ground, and Jackson says it is planned to push development. Any ore mined will be treated at the Belcher mill, of which G. W. Daines is president and manager. Jackson says preparations will be made for a mill.

A. P. Smith has a bond on the Nine Strike group on Little Cracker creek, near Sumpter, for \$50,000. Smith has put men to work driving a lower tunnel than any of the present workings. The Nine Strike consists of seven claims, the southern extension adjoining the Cracker Jack and affording a millsite in the basin of Little Cracker creek.

E. Bamberger, of Salt Lake City, Utah, says, at the Gold Ridge mill, near Baker City, a cyanide plant will be added to the stamps. Of the mine, he says the ores are maintaining a good general average.

Asbestos is reported being taken from a mining property 15 miles from Sumpter, owned by J. H. McVickers of Sumpter. He says he located the asbestos fissures on either side of a porphyry dike cutting the formation on the Burnt river side of the slope. It is 8 miles from the railway and a wagon road could be built. The asbestos is said to be of merchantable quality.

#### Douglas County.

The Oregon Securities Co., which owns properties at Bohemia, will begin operating its 30-stamp mill next week. Ore has been blocked out in the Music mine, one of a group of seven which it owns. The company is driving a tunnel through the mountain from the Champion basin to the Music mine, a distance of 2000 feet, and progress is being made at the rate of 10 feet a day, with the use of air drills.

S. Bowden has bought the Sunset and Lily May group of gold claims, near Kerby, and has placed men to work to develop them. The ledge is 40 feet in width, of quartz, carrying values from wall to wall of from \$2.60 to \$4.60 a ton. Bowden is driving two tunnels 600 feet apart, each of which will tap the main ore body at a depth of 400 feet. The mountain is steep and thus depth is made fast, and a good millsite is afforded, as all ore can be moved out by gravity, says the Telegram. There is an abundance of timber on the claims and a good water right, ample to supply power for six months each season without assistance of steam. After opening up the property Bowden will put in a cyanide plant.

#### Jackson County.

Concentrates are being shipped to the smelter from the Opp mine, says the Jacksonville Sentinel. Work is being increased by J. W. Opp, the owner, and the mill is run steadily. The property consists of 400 acres of land, 1½ mile west of Jacksonville, on which are several ledges.

E. T. Staples has bonded the McKinley group of mines on Wagner creek for \$20,000. The claims are an extension of the Ashland mine, near Jacksonville. Staples has started sinking an incline shaft.

#### Josephine County.

A. C. Hofer, of Portland, manager of the Mount Pitt Hydraulic & Q. M. Co., operating on Jump-off-Joe creek, near Grants Pass, says the crosscut tunnel has cut a 10-foot ledge at depth of 75 feet. The ledge carries gold values from wall to wall. Several hundred acres are embraced in the Mount Pitt Co.'s holdings. Aside from the quartz claims being developed, there is an area of placer ground, in Bummers Gulch. The country is well timbered, and watered.

The Rand M. Co., composed of Washington men, who have bought the Yank group of gold and copper claims of the Galice district, on Rogue river, near Grants Pass, for \$60,000, have placed a crew and begun development work for

the summer. The workings of the mine consist of 700 feet of well-timbered tunnels and drifts, on the mountain above Rogue river. The new owners have begun driving a tunnel several hundred feet below the old workings and nearer the level of the river. A raise will connect the two levels. There is a site for a smelter, plenty of water and timber.

At a depth of 100 feet a body of ore carrying values in gold is reported opened by Riggs & Flamm in the Red Bean mine, of Starveout creek, near Grants Pass.

#### Lane County.

Consequent on the decision by the Circuit Court in the case involving title to the Doctor mine at Blue River, growing out of the adverse claim filed in the land office at Roseburg, it is expected, says the Telegram, that this season the present 15-ton capacity mill will be increased to a 50-ton plant to concentrate the gold from the ledge opened under Manager Candiani of Portland. Development work will be resumed.

### SOUTH DAKOTA.

#### Custer County.

The Extreme M. Co., operating the Minnie May mine near Custer, is supplying its 10-stamp mill with ore from an open cut. The ore is reported improving. The men have advanced 20 feet northerly from the old opening and are now working in an easterly direction, following the zone of the greatest oxidation.

#### Lawrence County.

F. G. Underwood has leased the bed of Homestake sands at Pluma and is preparing for their treatment with cyanide. There is estimated to be from 60,000 to 75,000 tons of the sand and assays show \$3. Underwood is building a 10-ton tank on the dump for testing. This accomplished, he intends to put in two tanks, each of fifty tons capacity. These sands were impounded several years ago by diverting the waters bearing them from the main channel of the creek and allowing them to settle in a depression.

The mills and cyanide plant of the Horseshoe M. Co. continue in steady operation, no time having been lost there on account of the floods. The company is working in its mines which escaped damage. The Ben Hur mine was flooded, and is not expected to be unwatered until the volume of surface water decreases. From its other openings the company has increased shipments.

Treasurer H. F. Wells of the Lexington Hill G. M. Co., operating near Deadwood, in his report to the stockholders says the working tunnel, in 400 feet, is progressing at a rate of 7 feet per day, and the same will, by August 20th, have cut the quartzite bed, which will constitute the main supply of milling ore. From that point the tunnel will be driven ahead while additional men will develop the quartzite body and block out ore. Surveys show the quartzite body will be cut 750 feet from the mouth of the tunnel, and by extending same another 250 feet will connect with a shaft sunk on the Champion mine. The shaft will furnish ventilation for all underground workings and will also serve as an outlet for the ore left in the upper part of the Highland Mary vertical vein. The lower part of this vein, separated from the upper by a porphyry intrusion, will be opened on the tunnel level below. The management has decided not to start the mill before a substantial body of ore is developed in the tunnel, although the mill is being put in condition to be ready for operation as soon as needed. Amalgamating plates for saving free gold are in the mill.

The Gilt Edge-Maid M. Co., operating on Strawberry gulch in Bear Butte district, 2 miles west of Galena, reports work progressing on its mill. G. A. Duncan is manager and J. L. Turner of Springfield, S. D., is president of the company. The mill will be wet crushing, with capacity of 150 tons daily. Chili mills and slimes separators will be used. Power will be obtained by electrical transmission from Pluma. The company owns the Gilt Edge and Dakota Maid mines and has been making ore shipments to the smelters, hauling the ore by wagons a distance of 8 miles. A railroad siding has been built from the Burlington line to the site of the mill.

The Michigan G. M. Co., J. B. Mars of Deadwood president and manager, expects to resume work on its group in Strawberry gulch, near Galena.

O. O. Stromsness and G. M. Johnson, who have been sinking a shaft on their claims in Bear gulch section, have suspended work temporarily due to excess of surface water, which they cannot handle with their whim. The shaft is down 230 feet. They own 600 acres of mineral land between Bear gulch and Sand creek, 2 miles north of Tinton. Johnson says he will equip an assay office at the mine.

A. Dunn reports opening up a body of galena on the Belle Eldridge claim in

Spruce gulch, near Deadwood, carrying values in gold, lead and silver.

The Commonwealth M. Co. has been organized to operate in the Black Hills, and owns property adjoining that of the Globe M. Co. in Lead.

Pennington County.

The Pittsburg M. Co., owning the Kimball group on Newton's Fork, near Hill City, consisting of 400 acres, is arranging to increase development work. Machinery, consisting of hoists and air compressors, is on the ground and operations will begin next week. The gold is free milling, but is refractory as depth is attained. The ore has average value of \$6 per ton. Work will be started by the company on King hill.

The Black Eagle M. Co. is putting in a Huntington mill on the Black Eagle group in Hornblende camp, near Rochford. The washing out of the wagon road has delayed delivery of building materials and machinery. Water for the plant will be pumped from Castle creek. The Black Eagle group joins the Golden West M. Co. holdings. J. Hartgering of Deadwood is superintending the mill construction.—The Golden West M. Co. sawmill, which has been getting out lumber for the company's flume, is idle temporarily due to the roads being washed out so that saw logs cannot be delivered. E. J. Kennedy, manager, says a quartz mill is proposed and will be operated by water power, the water to be obtained from Castle creek. Part of the fluming and ditch have been built, and the company is driving a tunnel to get through a hill on the course of the proposed ditch.

UTAH.

Beaver County.

Frisco reports say W. H. and O. B. Peck have a contract for a large tonnage of zinc ores from the Horn Silver M. Co., and are preparing to put up a plant for the reduction of the refractory ore. The buildings will require 300,000 feet of lumber, the contract for which, it is said, has been let. It is said the Newhouse M. & S. Co. will sell the necessary water for the operation of the plant if built at the mine below Frisco, and W. H. Peck is looking into the feasibility of building a pipe line over the mountains. To do this a pumping plant would be required to bring the water up to the summit from the reservoir at Newhouse, and thence it would make its way on down to the millsite by way of gravity. The pipe line would be about 3 miles in length.

The tunnel through which the ores of the Cactus group of mines at Newhouse are to be extracted has passed the station 4000 feet from its mouth, with 1800 feet additional to drive to a connection with the ore bodies, says Manager Johnson. The raises from the station with which the tunnel will connect on the 600-foot level are going up rapidly.

Manager Tarbet of the Estella mine, near Milford, reports development work progressing. He is awaiting arrival of milling machinery. A few men are kept busy in the mine blocking out ore. The mill will begin with a small battery of stamps, sufficient to crush from twenty to thirty tons of ore daily. The ore is free-milling gold, and amalgamating plates will be used.

Juab County.

Manager S. McIntyre of Salt Lake City of the Mammoth Co.'s mines at Robinson reports a body of arsenical copper ore broken into in the east crosscut. The drift, it seems, had been paralleling the shoot for some little distance, a fact that was established when a round of holes were fired in the side. This shoot of ore is thought to be a continuation of that cut on the 1700-foot level. They are driving in same direction on the 1800-foot level. The ore carries silver and gold values with the copper. About 2000 tons of high-grade ore per month are being marketed.

Work will be resumed at the General Logan property, west of the Bullion-Beck ground, near Eureka, this summer. The office of the company will be moved from Salt Lake City to Eureka. W. D. Meyers of Eureka is part owner.

The consolidation of the Bullion-Beck Tunnel Co. and La Reine M. Co. is reported completed and the Beck Tunnel Co. Co. organized. The officers of the consolidated company are: J. Knight, president, with J. Evans, R. E. Allen, H. Dinwoody and E. H. Mead directors. The headquarters of the company will be at Provo.

Salt Lake County.

Machinery, consisting of a compressor plant, engines and other equipment, for the Bingham West Dip M. Co., has arrived at Bingham. Manager L. La Vine says it will be set up this month.

The new smelter equipment at the Utah Con. C. Co. plant near Murray was put in operation last week, says Manager Channing. The additional improvements to the Utah Con. plants represent an out-

lay of \$250,000. During the past year the company's mines at Bingham have been required to furnish daily tonnage of 500 tons; but with the new equipment in service the company is prepared to handle at least 800 tons daily.

Work has been resumed at the Wheeler & Wilson group, in the Big Cottonwood district, near Alta, says Superintendent Grey.

The fourth furnace at the Bingham Con. C. Co. smelter at Bingham was blown in last week, and the plant is equipped for the reduction of the usual volume of ore. The foundation for the fifth furnace has been started, says Manager D. McVichie. With the fifth furnace in blast the management will be able to reduce 1000 tons of ore daily.

Summit County.

The pumps at the South Quincy mine at Park City are working again and the mine is being drained to resume development, says Manager G. D. Turner.

At the Liberty mine, near Park City, development work will be increased. Men are at work driving a tunnel, which is in 600 feet. It is intended to send this tunnel to depth of 1000 feet. Work is being done by hand drills, but a compressor and machine drill will be put in. W. M. Ferry is manager.

Tooele County.

The mill on the properties of the Overland M. Co. at Sunshine will be put in operation between July 15th and 20th, says F. Pierce of Salt Lake City. Receiver Clark is rushing repairs and alterations. Underground there will be no exploratory work until the earnings of the mine justify it. On the contrary, he expects to make a profit on the 100,000 tons which have been blocked out by the company. At the Ophir Hill mines and mill in Ophir canyon, of which Clark is manager, the mill is operating with two shifts.

It is reported there is a shortage of miners at Mercur. The starting of the Overland and the resumption at the Ophir Hill has had the effect of drawing the men from the Con. Mercur and Sacramento mines. It is claimed the mines in the gold camp could use fifty additional men.

Utah County.

A bond and lease have been given to W. S. Lyle of San Francisco, Cal., on the North Star No. 1 mining claim in the Silver Lake mining district, in American Fork canyon, near American Fork. The claim adjoins the Ontario on the north. Consideration was \$3000 and 25% of the net proceeds of all shipping ores that may be marketed and 15% of milling ores that may be milled and sold.

The Utah Fire Clay Co. has bought for \$130,000 a group of mining locations in Lehi mining district, near Provo.

WASHINGTON.

Ferry County.

(Special Correspondence).—There is no inducement to extract ore or do any considerable development work, as no time can be predicted when the smelters will get ready to take a few more tons of ore. A number of mines have been kept in operation for a year or two with the hope and promise that the ore would be treated in considerable quantities. The smelters have failed to take the ore as fast as mined, and, thus hampered, the mine owners were compelled to close down, as it was not profitable to mine on so small a scale. Owing to the impossibility of getting adequate treatment for the ores, only two companies are working, and these only on a limited scale. To a layman this appears like an ideal place for a custom smelter. It could have 500 tons daily for a starter, and this amount could be increased to 1000 tons inside of sixty days. There are fifteen mines to draw upon having a capacity of producing from 15 to 150 tons each per day. Two lines of railway offer all necessary facilities for cheap and rapid transportation. There is every variety of ore necessary for fluxing and also all the water which will be necessary. It would be possible to operate the plant with water, steam or electric power at the option of the builder. Coke would have to be shipped in—all other things are here. The mine managers are willing to sign contracts for supplying the ore in any desired quantity.

The great iron belt a few miles east of Republic is capable of furnishing all the ore of that character which can be consumed by a smelter. The ores carry gold, copper and silver to the value of about \$15 per ton.

The Belcher mine is developed to a depth of 250 feet. The ledge has been drifted upon for 400 feet. Within a few months it will have a tram in operation between the mine and the Kettle Valley and Great Northern Railroads.

A short distance east of the Belcher is the Midnight—a copper, silver, gold and lead property. It is to be operated on an

extensive scale as soon as the necessary buildings for the accommodation of the men can be completed. The mine is located on the summit of a mountain some 2000 feet above Lambert Creek valley. An aerial tram will be constructed from the mine to the valley for the transportation of the ore and for getting supplies to the mine. At the points where opened the ledge is 5 feet in width.

Republic, June 25.

The Belcher M. Co., at Republic, is arranging for an eight drill air compressor plant and an impact wheel for driving it by water power. Two shifts are at work on the Belcher No. 2 tunnel.

Pierce County.

The Tacoma smelter, employing 400 men, has planned to add an electrolytic copper refinery plant to cost \$250,000 and to put on 100 more men. Wire works will be built by the company connected with the smelter company for making copper wire, either at Tacoma or in San Francisco, Cal. T. K. Wilkinson will be superintendent of the electrolytic refinery.

Sachomish County.

The Ethel Con. M. Co. property at Index is reported closed down for lack of ore, the work on the tunnel on which work has been progressing since July, 1903, to locate at greater depth the ore discovered in the upper levels having proved futile, says Secretary Greer, of New Castle, Pa. The company is a consolidation of the Ethel C. M. Co. and the John D. C. M. Co. and there is a concentrating mill built at the mines.

Stevens County.

Placer miners on the Nigger creek diggings of the Hudson Bay Co., 4 miles above Northport, on the opposite side of the Columbia river, say gold values are being found, but it is too fine to be saved by cradle or the sluice box method.

WYOMING.

Crook County.

The Warren's Peak M. Co. has development work under way in the Bear Lodge range of mountains, near Sundance, Wyoming. The company is owned chiefly by the Bock Brothers of Rochford, S. D. E. A. Bock is president. Warren's Peak is a few miles north of Sundance in the Bear Lodge mountains, and gold bearing veins are being opened up there.

FOREIGN.

AFRICA.

Transvaal.

The Johannesburg Leader says the explosive works of De Beers Con. M. Co., Ltd., at Somerset West, have been in operation for six months. Employment is given to 500 Europeans and 1000 natives. The factory is turning out 12,000 cases (each containing fifty pounds) of blasting gelatine, gelignite, and American dynamite, a month, and the output will be doubled. The power plant is capable of developing 1300 H. P., and includes two dynamo turbines of the Parsons type. The grounds cover 3000 acres, buildings being scattered over an oblong about 2 miles in length and 3/4 mile in breadth.

General Manager G. E. Webber of the Rand Mines, Ltd., at Johannesburg, in his report for the year 1903, gives the following summary of operations of subsidiary companies for 1903:

Company.	Days.	Period of Milling.	Average Number of Stamps in Oper.	Tons Milled.	Gold Produced.	Value Per Ton Milled.	Cost Per Ton Milled.	Working Expense.
Glen Deep, Ltd.	367		80	143,310	54,628,727	12 s. 0.	4 s. 9.	9.5
Rose Deep, Ltd.	348		115	910,759	77,671,927	11 s. 0.	4 s. 17.	8.4
Gelduinus Deep, Ltd.	347		175	773,770	112,305,125	11 s. 0.	4 s. 17.	8.4
Numbers Deep, Ltd.	352		85	182,215	68,114,725	11 s. 0.	4 s. 17.	8.4
Porter Deep, Ltd.	354		55	102,205	67,688,888	11 s. 0.	4 s. 17.	8.4
Crown Deep, Ltd.	354		55	102,205	67,688,888	11 s. 0.	4 s. 17.	8.4
Langlaagte Deep, Ltd.	355		135	233,697	89,267,257	11 s. 0.	4 s. 17.	8.4
Durban Roadpoint Deep, Ltd.	335		55	138,291	54,356,059	11 s. 0.	4 s. 17.	8.4
Totals and averages:	880		880	1,543,542	628,747,801	11 s. 0.	4 s. 17.	8.4

Compared with the operations of the previous year, an increased working profit is shown of £448,829 7s 4d. Working costs have decreased 1s 3.15d per ton; working revenue has increased 4.746d per ton, and the working profit has increased 1s 7.896d per ton. These results, however, are still below what can be expected from the group when taking into account the fact that, in order to carry on the year's scale of operations, it has been necessary to break about 93% of the ore stopped, with machine drills, says Manager Webber, and limit the sorting operations to an average of about 7%, whereas, if working under conditions that would ensure the best economic results, probably not over 60% of the ore would be stopped by machine drills, while fully 20% to 25% of waste rock would be discarded. The companies are still restricted in their normal operations, and in several cases, although now earning profits, have not yet been able to reach or resume the payment of dividends, owing to liabilities incurred on capital account or expenditure and losses made during the war period. The present condition of most of the producing mines in which the company is interested is satisfactory, and the return to their normal output is only contingent on their obtaining the requisite amount of labor.

AUSTRALIA.

Queensland.

The gold production of Queensland for month of May is reported as follows:

	Tons Crushed.	Yield in Ounces.
Charters Towers	23,700	23,300
Croydon	5,700	1,300
Gympie	17,500	11,700
Mount Morgan	28,700	13,000
Ravenswood	2,000	3,000
Other Fields	5,300	3,100
Alluvial		1,000
Total Yield		60,300

BRITISH COLUMBIA.

Boundary District.

At the Granby smelter at Grand Forks, Manager Graves says they are taking custom ore in addition to ore from the company's mines, and are running to the full capacity of 2000 tons a day. As fast as the tonnage increases and the country warrants it the smelter will be enlarged. When they do enlarge the plant, he says it will be made a 3000 or 4000 ton smelter.

East Kootenay District.

Hydraulic mining is in full operation at Wild Horse creek, near Fort Steele, and the gold output promises to be large, says the Prospector.

The Gold River M. & P. Co., operating 16 miles south of Fort Steele, on Bull river, is increasing developments. Bull river was noted for its rich gravel, but owing to lack of means for controlling the water and the then available methods of mining, a large portion of the original rich gravel remained undisturbed, which is said to contain a workable percentage of gold. The Gold River Co. will dam Bull river, construct a flume capable of carrying all the water of the river at its normal stage. This will leave the original channel free of water, to be mined and gravel handled at a small expense. It is intended to put in a power plant to supply electricity for conversion into power and light in connection with mining operations, and other industries in the Kootenay valley.

Nelson District.

W. Moorhead and W. J. Marks, of Portland, Or., with D. Morrison, of Nelson, have bonded the Cliff mineral claim, on Toad Mountain near Nelson for \$20,000. The Cliff is 6 miles from Nelson and is a free-gold property with a 6-foot ledge, carrying ore which goes \$20 per ton. This ledge can be traced on the surface for 600 feet. It is said 100 tons have been shipped to the Hall mines' smelter which gave returns of \$24 per ton. It costs \$1 a ton to deliver the ore from the mine to the smelter.

Progress in development of Salmon river and Pend d'Oreille placers, near Waneta, is reported. While the number of prospectors operating individually is smaller this year than for several years past, the operations of the companies interested are reported assuming more substantial proportions. A company, composed of New York, N. Y., and Philadelphia, Pa., men, who have taken up the Rose leases on the Salmon river (represented on the ground by A. P. Rose), is increasing work. One of the company's projects is to divert the flow of the river into an ancient channel, thereby enabling the economical handling of gravel in the present river bed. An Oregon company is operating at the "big eddy" on the Pend d'Oreille, and expects to increase operations this summer. Much of the gold found at this point is very fine, and it has been found necessary to supplement the ordinary sluice boxes and rifles with

amalgamating plates. On various leases along the river two or three men are employed, principally for holding the ground.

#### Rossland District.

Foreclosure on the Iron Mask mine at Rossland has been completed by D. C. Corbin, of Spokane, Wash., as trustee for the various interests. He has final title.

Crushing is under way at the O. K. stamp mill at Rossland, under lease to Le Roi company for concentration experiments. The interior of the structure has been changed. For handling ore supplies economically a bin has been built at one end of the O. K. trestle on the Spokane Falls & Northern main line, and ore will be dumped there from the cars. Connecting the bottom of the ore bin with the head of the mill is a tramline operated by cable. The hoisting engine to operate the cars is on the ground. The ore will first be crushed at the top of the mill in a Blake crusher, and the initial recovery of values will be by jigging. The coarser material left after the initial extraction will be crushed again in rolls, with crushing in the stamp battery for the finer material. The Frue vanner is the next stage of the process, preceded by a classifier. On the conclusion of the other stages the tailings will be finally treated on slimes machines, or tanks.

#### Slocan District.

Work will be resumed on the Utica group between Kaslo and Sandon this month. It has been idle for the past four months. It is a silver and lead producer.

#### Yale District.

The Teague M. Co. expects to get out \$2,000,000 from its Siwash creek mines at Yale, says F. Richards of Vancouver, who holds concessions from the Government for 1½ mile of the creek adjoining the property of the two American companies known as the Mount Baker & Yale Co. and the International G. Co. The Teague property lies below the mouth of the creek, having a deposit which Manager Teague will wash with monitors. Free milling ore is being opened up, says Richards, averaging \$3 to the ton. The companies interested are putting in plants. The Mount Baker Co. is putting up a 10-stamp mill, to be increased to forty stamps; has built and equipped a sawmill, constructed a wagon road over the mountain and a cable bridge across the Fraser river at Yale. The International Co. is putting in a plant, including six stamps, with quadruple discharge. Siwash creek is within 2 miles of Hill's Bar, the discovery of which led to the Cariboo rush.

### CANADA.

#### Ontario.

Secretary R. J. Hall of the Gold Standard M. Co. of Morris, Minn., operating in the Manitou section, near Wabigoon, says operations will be increased and work resumed on the Gold Standard, the shaft of which was sunk 150 feet before mining was temporarily suspended on that location.—It is understood that the Manhattan G. M. Co. of Berlin, Ont., intends to resume mining operations on its location on the south shore of Eagle lake. Beyond surface work, little mining has been done by the company, although two veins have been exposed, says Manager Stanton of New York.—The Northern Development Co., operating the Paymaster mine, near the Big Master mine near Wabigoon, has re-elected J. E. Burns president and increased the board of directors from five to seven. Machinery for development of its mines has arrived on the ground.

### INDIA.

The output of the gold mines for month of May is reported at 51,242 ounces—an increase of 2614 ounces as compared with the corresponding month of 1903. The production in ounces since the beginning of the year has been as follows:

	1904
January.....	51,588
February.....	50,151
March.....	51,634
April.....	50,509
May.....	51,242
Total.....	255,224

In Kolar district, Mysore, the following reports for month of May are given: Champion Reef mine: Mill, tons, 15,320; mill, ounces, 15,339; tailings (cyanide) tons, 20,176; tailings, ounces, 2397; total ounces, 17,736.—Mysore: Mill, tons, 16,050; mill, ounces, 15,405; tailings (cyanide) tons, 13,106; tailings, ounces, 1473; total ounces, 16,878.—Ooregum: Mill, tons, 11,189; mill, ounces, 5371; tailings (cyanide) tons, 10,076; tailings, ounces, 873; total ounces, 6244.—Nundydroog: Mill, tons, 6400; mill, ounces, 5032; tailings (cyanide), tons, 5018; tailings, ounces, 564; total ounces, 5596.—Balaghat: Mill, tons, 2950; mill, ounces, 2297; tailings, tons, 2380; tailings, ounces, 246; total ounces, 2543.—Coromandel: Tons, 1070; ounces, 335.—Mysore West & My-

sore-Wynad: Mill, tons, 1904; total ounces, 1013.—Hutti (Nizam's): Tons, 1300; ounces, 797.

### MEXICO.

#### Durango.

A. T. Grove, of Chicago, Ill., secretary and treasurer of the American-Mexico M. Dev. Co. of Chicago, says that company has bought two tracts of land in Durango and contemplates expenditure of one mil-

lion dollars in gold on its properties at Velardena and Pedricena, in State of Durango, near Torreon. He has bought 300 hectares (about 800 acres) of land near Torreon at a cost of \$35,000 gold. On this Grove estate the company will build a smelter at a cost of more than \$300,000 gold and the ores from the principal mines of the company, in the Margarita group of claims, will be treated there. This group comprises La Roca and La Victoria mines, both of which are producers. The company, according to Grove, will also build a pyritic smelter of 200 tons capacity at Velardena, for treating its sulphide ores from the Margarita mine, and the Refugio property, at Reyes. Some sulphide ore also comes from one of the veins of the La Roca mine. In addition to the pyritic smelter at Velardena, a power plant will be erected for generating electricity by use of gasoline.

#### Guerrero.

Preparations are under way for a 200-ton smelter at La Dicha mines at La Dicha. E. D. Elson, manager, reports there is 20% copper ore showing. The plant will be equipped with a 200-ton water jacket blast furnace and two 50-ton reverberatory smelting furnaces. The company also has completed grading for 9 miles of narrow gauge road.

#### Jalisco.

At the Calabaza mine at Etzatlán they have begun work again, after a shut-down of two months.—W. M. Mathews is operating the San Pablo group on Cebolla mountain, between the Santo Domingo and Altamira mines. This group consists of the San Pablo, San Jose, Hecla, El Rincon and San Jose and Calabaza demasias (fractional claims). He has thirty-five men at work cleaning out the old works and taking out ore.—An English company, represented by J. Hopkins, has an option on El Refugio mine, which adjoins the Calabaza on the north.—T. H. Whitney and London people have a bond on El Mono, Santa Clara and Zopilote Annexes mines, nine hours' ride north of Etzatlán.

Ore has been struck in the Culebra mine, near Etzatlán, owned by T. C. and H. K. Myers. The strike was made in driving a tunnel 165 meters in length. The ore is said to run 80 kilograms of silver and 50 grams of gold per ton. The paystreak is 18 inches wide on the foot-wall. Between this streak and the hanging wall is 1½ meters of ore which runs 2 kilograms of silver and 6 grams of gold per ton. The Culebra is an "antigua" mine. T. C. Myers on buying the mine three years ago decided to drive a tunnel to cut the shaft, which has now been reached.

The Altamira M. Co. has men at work developing a group of sixty-three pertenencias of mining land near Ahualulco. Air compressors and drills are on the ground and will be set up. W. S. Matthews, of Etzatlán, is president and D. Ryan of St. Paul, Minn., managing director. They have doubled the number of men at work this week.

The Fortuna M. Co. is erecting a 10-ton mill at the Candelaria mine at Etzatlán. It is expected to have the mill in operation by August 1.—Carroll & Kratz have about completed the removal of their mill to its new location, and expect to start work in August.—The Amparo M. Co. is getting its machinery in place. Re-denouncement of the "antigua" Spanish mine in Guachinango district, near Ameca, known as La Reforma, has been made by F. C. Martinez. The mine recently reverted to the government because of default of taxes. The mine was formerly known as Las Bolas and also under the name Cuitascolco.

#### Lower California.

The Valle Perdido mine, near La Paz, which is owned by a Los Angeles, Cal., company, is again being worked under management of J. H. Mendoza, after an idleness of twenty years. Silver-copper ore was formerly produced. Recent development work, however, is said to have resulted in opening ore that contains gold values, and the company proposes to put in machinery, including a cyanide plant.

#### Michoacan.

At the Inguaran copper mines, in southern Michoacan, owned by Rothschilds Bros. of Paris, France, the electric power and light plant has been completed and will be put in operation this week. Water power from a fall near the mine is utilized

for development of electricity. Surveys are being made to connect the mines by railroad with the Urupan branch of the National railroad. Nothing has been done with the road surveyed from the mines to Zihuanabejo, on the Pacific coast.

#### Nuevo Leon.

The Monterey News says the National railroad will build a branch 23 kilometers long from its Monterey-Matamoros line, under construction, to the Cerralvo lead mining district. The ores of the Cerralvo district are said to be high-grade galena.

The H. C. Harrison smelter in this district has been in operation five years, although not on an extensive scale. The product of the smelter in bar bullion has been about 3200 bars a month, each bar representing 105 pounds. This was practically all lead.

#### Sonora.

It is reported a reduction plant will be built at the Sultana mine, owned by J. L. Giroux, of Los Angeles, Cal. The Sultana is at Copete, near the Copete mine. The main shaft is at a depth of 1050 feet, in ore all the way down. In going down levels, drifts and crosscuts have been run, and ores blocked out ready for stoping and hoisting. It is said that at the 1050-foot level the ore body, as shown by crosscuts, is 36 feet in width, and carries copper, gold and silver to value of \$60 gold per ton.

J. McHenry has an option on the San Juan mine near Navidad, near Mascota, and is preparing for operations.

#### Vera Cruz.

The Oil Fields of Mexico Co., developing oil lands 40 miles from Vera Cruz, is reported preparing to build an oil pipe line from its wells to the port of Vera Cruz. P. N. Furber of New York City, N. Y., is president of the company.

### Personal.

W. F. EDMONDS, a mine owner of Denver, Colo., is in San Francisco, Cal.

P. L. VERCOE, a mine manager of Fresno, Cal., is in San Francisco, Cal.

J. B. RACKLIFFE of Boston, Mass., is in San Francisco, Cal., on mining business.

W. P. LYNCH, interested in gold dredging operations at Oroville, Cal., is in San Francisco, Cal.

W. M. MCGREGOR has returned to Hill City, South Dakota, after several years' mining in Mexico.

M. F. CROSSETTE, interested in mines near Ameca, Jalisco, Mex., is visiting in Ithaca, New York.

W. G. SCOTT, superintendent of the Black Oak mine, at Soulsbyville, Cal., is in San Francisco, Cal.

J. R. PRICE of Stateline, Utah, has gone to Cananea, Sonora, Mexico, to make mine examinations.

C. C. JONES, consulting engineer of the Mountain Copper Co. properties in Shasta county, Cal., is in the East.

J. A. GROESBECK of Salt Lake City, Utah, has gone to Peru, South America, to make mine examinations.

Z. KENDALL of Tonopah, Nev., interested in Goldfield, Esmeralda county, mines, is in San Francisco, Cal.

WM. COOPER, manager of the Capital Prize mine, Georgetown, Colo., has returned there from St. Louis, Mo.

D. MCVICHIE of Salt Lake City, Utah, manager of the Bingham Con. Co., is in the East on company business.

H. W. EDWARDS has been appointed superintendent of the Comanche smelter now building at Silver City, N. M.

R. H. CHANNING of Salt Lake City, Utah, manager of the Utah Con. Co., returned last week from Colorado.

D. KENNEDY, manager of the Centennial G. M. Co., has returned to Georgetown, Colo., from an Eastern trip.

M. GRIER is superintending work on the Hearst estate, near Palermo, Cal., preliminary to dredging operations.

W. H. KINNOR, recently superintendent of the Majestic smelter at Milford, Utah, is in Mexico, starting up a plant.

W. H. HAMPTON, formerly of Grant's Pass, Ore., is now manager of the Jualpa Co., with headquarters at Juneau, Alaska.

D. T. PARKER of Denver, Colo., returned there last week from a trip to Boulder county on professional business.

W. W. WORTHING, superintendent of the Rhetta Con. mines, near Plymouth, Amador county, Cal., is in San Francisco, Cal.

C. S. PORTER, formerly with the Esperanza Co. of Cedros Island, Mexico, is operating a reduction plant at Vulcan, Colo.

G. B. WILSON has resigned as assistant superintendent of the Quartette M. Co. at Searchlight, Nev., and has gone to Boston, Mass.

G. CARLSON, of Idaho Springs, Colo., is making an extended trip through Europe and will return from there about September 1st.

C. E. JAMISON, formerly of Parker & Jamison, assayers, Denver, Colo., is now located at the Exposed Treasure mine, Mojave, Cal.

D. ROBINSON, formerly superintendent of the Allison Ranch mine, near Grass Valley, Cal., is at the Andes mine at Virginia City, Nev.

CHAS. COLCOCK JONES, late of the Mountain Copper Co. of Keswick, Cal., has established an engineering office in Salt Lake City, Utah.

S. H. BALL has charge of the work at Idaho Springs, Colo., for the U. S. Geological Survey. J. E. Spurr is expected there about July 10th.

C. C. JONES of Salt Lake City, Utah, recently consulting engineer for the Mountain C. Co. of Shasta county, Cal., is in San Francisco, Cal.

C. T. DURELL of Maiden, Mont., has returned from California, where he has been examining gold-dredging properties on the Sacramento river.

A. B. FOSTER, G. B. HOLDEN AND E. NOYCE have returned to Boston, Mass., from Empire, Colo., where they have been examining mining interests.

W. CHRISTOFFERSON is in Salt Lake City, Utah, from Norway, where he has been superintending development of nickel mines owned by Utah men.

JOHN T. JAMES, vice-president of the North American Prospecting & Mining Association of Denver, is in Chicago on business connected with his company.

C. K. TIBBETTS, manager of the Pfau G. M. & R. Co., operating at Cherry, Yavapai county, Ariz., has returned there from a business trip to Salt Lake City, Utah.

B. TREWEEK, formerly of Lead City, South Dakota, has returned to Bluefields, Nicaragua, where he is manager for a mining company, after a visit to Lead City.

PROF. E. L. KURTZ of Columbia University, New York, has charge of the students of the summer school at Silver Plume, Colo., in the absence of Prof. Munroe, who is in New York.

J. M. THOMAS of Bisbee, Ariz., recently with the company operating the Pittsburgh & Duluth mine, is in charge of the World's Fair mine in the Harshaw district, near Patagonia, Santa Cruz county, Ariz.

EPES RANDOLPH, president of the Gila Valley, Globe & Northern Railroad, has been elected president of the Maricopa & Phoenix Railroad. This places Col. Randolph at the head of all the Southern Pacific lines in Arizona.

V. H. METCALF, congressman from the Third Congressional district of California, has been appointed a member of the President's Cabinet, having charge of the Department of Commerce, which comprises the federal supervision of mining interests.

T. K. WILKINSON, formerly superintendent of the electrolytic copper refinery at Anaconda, Mont., has been appointed superintendent of a similar plant to be built at the Tacoma smelter at Tacoma, Wash., and has gone East on company business.

THOS. RICKARD, of the firm of Harron, Rickard & McCone, of San Francisco, Cal., whose residence is in Berkeley, Cal., is prominently mentioned as congressman from the Third California Congressional district to succeed V. H. Metcalf, who this week enters the President's Cabinet.

H. H. NICHOLSON, recently professor in the mining department, University of Nevada, at Reno, Nev., is consulting engineer for the Killen-Warner-Stewart Co., operating mines in Oregon, and will make his headquarters at Sumpter and assume charge of their mining operations.

WILLIAM C. POTTER of the firm of Dickman, Mackenzie & Potter of Chicago, Ill., has been offered, and has accepted, the position of superintending engineer of the Guggenheim Exploration Co. in the Republic of Mexico, with headquarters at Mexico City. Mr. Potter still retains membership in the firm of Dickman, Mackenzie & Potter, but will devote his entire attention to the business of the exploration company.

## Commercial Paragraphs.

NORMAN A. ROOT is now associated with H. V. Croll in the Haywards Building, San Francisco, Cal., representing the Allis-Chalmers Co.

THE Hydro-Carbon Paint Co. of Denver, Colo., report recent orders for their material and shipments from New York City, New Haven, Conn., St. Louis, Mo., and Chicago, Ill.

THE Little Wonder air hammer rock drill is on exhibition at the Nicholls Manufacturing Co.'s exhibit, Block 8—A, manufacturers' building, World's Exposition, St. Louis, Mo.

THE New Era Machinery Co. of Denver, Colo., report recent sales of Wallace stamp and grinding mills to the Etna G. M. Co. of Huitzo, Oaxaca, Mexico, and the Carrizal G. M. Co. of Carrizal, Michoacan, Mexico.

THE Stanley Electric Manufacturing Co. send a wall map of the "S. K. C. System of Long Distance Transmission in California," an interesting presentation of a great electric transmission system of the Pacific coast.

THE pneumatic tool department of the Ingersoll-Sergeant Drill Co. issues a pamphlet describing and illustrating the construction of the Haeseler axial valve hammers. Incidental reference is made to a recent Supreme Court decision regarding patented features of pneumatic hammer handles.

ERNEST GAYFORD AND F. P. CALLOW, respectively superintendent and consulting engineer of the Colossus G. M. Co. of Waxhaw, N. C., have resigned their positions and will open a consulting office in Charlotte, N. C., making a specialty of designing and erecting cyanide plants in the South and elsewhere.

THE Engineering Co. of Mexico has been organized with headquarters in the city of Mexico. Egbert Smit is consulting mining engineer, W. L. Holms consulting metallurgical engineer, Norman Rowe consulting electrical engineer, L. M. Green chemist and assayer, P. G. Holms assistant chemist and assayer.

THE Gardner Electric Drill & Machinery Co. has secured the exclusive right for the manufacture and sale of the new Adams electrically driven rock drills. Bulletin No. 1 graphically illustrates and describes the device. The company is now prepared to furnish this new machine. E. C. Means, the Western manager, 1515 Seventeenth street, Denver, Colo., can furnish all further necessary information relative thereto.

THE Rand Drill Co. has a contract for two compressors to be used in the Central air power plant 18 miles below Sault Ste. Marie. They will supply air to operate twenty-five little giant rock drills, four three-ton cableways and four large water pumps. Their combined capacity is 6600 cubic feet of free air per minute. The work in hand is for constructing and dredging a 2-mile channel in the Soo river wide and deep enough for the navigation of large vessels.

THE Crocker-Wheeler Co. of Ampere, N. J., write: "The equipment of factories with electric motors for individual and group drive of machine tools has become an extensive department of our business. We are now prepared to give our clients expert advice upon the latest ideas and results in shop practice, in addition to purely engineering advice upon the design and installation of electrical apparatus for shop equipment. We have retained the well-known firm of Dodge & Day, modernizing engineers of Philadelphia, Pa., and place the services of this firm at the disposal of our customers, giving them gratuitously the benefit of its wide experience and data. The experience of the electrical engineer alone does not fully cover the numerous factors that are met in these days in the dividend-making management of machine shops. While the economies that may be effected by electric drive are conceded by all, the actual savings accomplished depend entirely upon the intelligence with which the apparatus is selected, installed and used. The advice and recommendations about which our customers may consult this firm need not be confined to electrical details, but may include all problems of shop equipment and management."

## Books Received.

"An Engineering Student's Notes," is the title of a neat little volume by J. Richards. It consists of a series of chap-

ters on practical mechanics and machinery told in an interesting narrative style. The Industrial Publishing Co., San Francisco, Cal., price \$1.00.

## Trade Treatises.

"Magnesia Coverings" is the subject of a very handsome brochure from the Philip Carey Manufacturing Co. of Lockland, Ohio.

Catalogue "E" from the Great Lakes Engineering Works, Detroit, Mich., describes and illustrates in detail their vertical compound two-stage compressor.

Bulletin No. 350 on stationary and portable motor-driven air compressors for continuous and intermittent service, from the National Electric Co., Milwaukee, Wis., gives some practical points thereon that are worthy of observance.

"Prospecting for Coal, a Simple Digest," from the Edw. Christman Co., Massillon, Ohio, gives some practical points on drilling test holes for coal and other minerals, and is excellently arranged. There is an illustrated treatise on knots that is worth reading.

## Obituary.

WALLACE COLBY, a Leadville, Colo., mining man, died at Leadville, June 27th.

JACKSON TAYLOR, recently of Newburgh, N. Y., assayer at a mine at Alta, Salt Lake county, Utah, died at Alta, June 26th. Deceased was a graduate of the Columbia School of Mines, New York City.

G. STANDART, a pioneer miner and mine owner of Plumas county, Cal., died at Greenville, Cal., on June 18th. Deceased was a native of New York, aged 68 years. He was at one time superintendent of the Golden Stripe M. Co. and principal owner in the Standart & McGill group of mines in Plumas county.

H. C. WALTERS, a mine owner and manager of Seattle, Wash., died at Tacoma, Wash., on June 13th, after a two months' illness. He has been identified with the Providence mine of Greenwood, B. C., the Snow Shoe mine of Libby, Mont., the Britannia mine, near Vancouver, B. C., and in Rossland, B. C., and Oaxaca, Mexico, mines.

## Latest Market Reports.

SAN FRANCISCO, July 1, 1904.

### METALS.

SILVER.—Per oz., Troy: London, 26d (standard ounce, 925 fine); New York, bar silver, 56½c, refined (1000 fine); San Francisco, 56½c; Mexican dollars, 46½c San Francisco, 46c New York.

COPPER.—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$12.75; Electrolytic, 1 to 3 casks, \$12.50; Casting, 1 to 3 casks, \$12.25; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £56 13s 9d spot per ton.

Copper shows no important change since last week's quotation. The general hesitation in promoting extensive new industrial enterprises, which is always a feature of the few months preceding presidential elections, is at the present time having a direct influence on the metal market—iron as well as copper.

LEAD.—New York, \$4.25; Salt Lake City, \$3.50; St. Louis, \$4.25 San Francisco, \$4.50, carload lots, 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 10s 7d long ton.

SPELTER.—New York, \$4.90; St. Louis, \$5.00; London, £22 2s ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$25.50 @ 25.75; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, \$30 @ 32½c. London, £115 spot.

PLATINUM.—San Francisco, crude, \$18.50 ½ oz.; New York, ingot, \$19.00 ½ Troy oz. Platinum ware, 75 @ 82c ½ gram.

QUICKSILVER.—New York, \$44.50 @ 45.50, large lots; London, £8 San Francisco, local, \$43 @ 43.50 ½ flask of 75 lbs.; Denver, \$46.00. Export, \$43.00 @ 43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

NICKEL.—New York, 40@47c ½ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

### STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.85 @ 13.35; gray forge, \$12.00; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23.00 @ 23.00; open hearth billets, \$23.00 @ 23.00; San Francisco, bar, 7c to 12c ½ lb.

### CHICAGO CURRENT QUOTATIONS.

Bessemer	13 00@15 25
Poundry Northern 1	13 75@14 00

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½ lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city ½ bbl.

CEMENT.—Imported, \$2.15 @ 2.65 ½ bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.45 ½ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

### GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ½ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ½ lb.; carloads, 23@23½c; in tins, 30c; soda ash, \$2.00 ½ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ½ lb.; Cal. s. soda, bbls., \$1.20 @ 1.40 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, \$2.00 @ 2.25; California refined, 1½@2c; sulphide of iron, 8c ½ lb.; copper sulphate, 5½@5½c; chloride of lime, spot, \$2.50 @ 2.75; sulphuric acid, in carboys, 66% B, 1½@2c ½ lb.; nitric acid, carboys, 8c ½ lb.

OILS.—Linseed, boiled, bbl., 49c; cs., 54c; raw, bbl., 47c; cs., 52c; Lucol oil boiled, bbl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c; Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naptha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 70c; Bleached, do., 80c; Whale Oil, cs., 52@57c.

COAL.—San Francisco, coast, 80c prices: Wellington, \$8.00; Seattle, \$6.50;

Coos Bay, \$5.00; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$11.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$11.50, long ton.

BONE ASH.—Extra No. 1, 5@6c ½ lb. No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, ½ lb., 7c; less than 500 lbs., 7½c. LITHARGE.—Pure, in 25-lb. bags, 8@9c ½ lb.

BORAX.—Concentrated, 6@7c ½ lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MOLYBDENUM.—Best, \$2.00 ½ lb.

CHROMIUM.—90% and over, ½ lb., \$1.00.

PHOSPHORUS.—American, ½ lb., 70c.

SILVER.—Chloride, ½ oz., 90c@1.00; nitrate, 55c.

MERCURY.—Bichloride, ½ lb., 77c.

MANGANESE.—Pure, ½ lb., 60c.

SODIUM.—Metal, ½ lb., 50c.

BISMUTH.—Subnitrate, ½ lb., \$2.10.

ALUMINUM.—No. 1, 99%, small lots, 37c ½ lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ½ lb., \$3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING JUNE 21, 1904.

- 763,141.—CHAIN BUCKET ELEVATOR—H. M. Barn-grove, San Jose, Cal.
- 763,009.—GAS GENERATOR—F. H. Bates, S. F.
- 763,245.—BOLT HOLDER—Bebler & Anderson, Los Angeles, Cal.
- 763,249.—CANT HOOK—N. Blanchet, Pendleton, Or.
- 763,146.—STAMP TAPPET—Brown & Hayes, Bishop, Cal.
- 763,045.—PAPER HOLDER—K. Cooper, East Highlands, Cal.
- 763,162.—FEED VALVE—J. L. Curran, Rocklin, Cal.
- 763,267.—ARTIFICIAL FUEL—J. T. Davis, S. F.
- 763,271.—GARMENT SUPPORTER—F. Ferguson, Santa Rosa, Cal.
- 763,276.—HORSE DETACHER—J. P. Gardner, S. F.
- 763,095.—AIR BRAKE—Graham & Potts, Seattle, Wash.
- 763,187.—VALVE—Kellar & Thomson, Covina, Cal.
- 763,324.—CULTIVATOR—G. W. Roberts, Lemoore, Cal.
- 763,072.—ADJUSTABLE BIT—W. H. de Roseau, Clifton, Ariz.
- 763,095.—KINETOSCOPE, ETC.—F. Schaefer, Seattle, Wash.
- 763,336.—ROTARY ENGINE—J. W. Swanson, Ballard, Wash.
- 763,030.—MINING APPARATUS—C. H. Thompson, Los Angeles, Cal.
- 762,905.—EXPLOSIVE ENGINE—L. F. Washburne, S. F.
- 762,969.—OIL BURNER—E. N. White, Oakland, Cal.
- 763,135.—PAYMENT MACHINE—G. R. Wilton, Los Angeles, Cal.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SELF ADJUSTING WAIST.—No. 762,581. June 14, 1904. Louise Fogus, San Francisco, Cal. This invention relates to a device for improving the set of blouse or shirt waists. It consists of a specially cut form having flexible bones extending substantially vertical within suitable casings and converging downwardly with relation to each other. There is a fullness to the lower part of the material within which the bones are fixed and the upper edge of the material is substantially non-extensible transversely. The effect of the whole arrangement is to cause the bones to curve outwardly so as to form a support for the exterior waist or covering.

CRUSHING AND GRINDING MILLS.—No. 762,580. June 14, 1904. J. M. Dyer, Douglas City, Cal. This invention relates to an apparatus designed for crushing and pulverizing ore bearing and other rock. It consists in the combination in an ore crushing and pulverizing apparatus, of a cone revolvable upon a vertical axis and having a spherically curved base flange; a cylinder of larger interior diameter than the cone and having a spherically curved base to fit the curvature of the cone flange. An annulus surrounds the top of the cylinder, said cylinder and annulus having their adjacent faces provided with a raceway containing balls, and said annulus having an outer curved surface. A plate is concaved to fit the annulus and is movable in a horizontal plane to tilt the upper end of the cylinder. A splash wall and screen surround the lower end of the cylinder and an annular trough surrounds the screen.

ELECTRICAL SPARKING IGNITER FOR EXPLOSIVE ENGINE.—No. 762,574. June 14, 1904. A. J. Bradley, Oakland, Cal. This invention relates to improvements in engines of the type employing an explosively hydrocarbon as a propelling medium. The device comprises fixed and rocking electrodes, a spring-pressed hammer arm carried by the rocking electrode and having a limited oscillating movement in relation thereto, a rigid anvil arm carried by said rocking electrode and disposed in the path of movement of said hammer arm and an oscillating part for operating said hammer arm slidable in adjustable resiliently supported guides disposed in the path of said arm.

WASH BOILER.—No. 762,576. June 14, 1904. Jas. L. Brobst and Jacob L. Brobst. This device consists essentially of a false bottom having a substantially fitting rim or flange around the interior of the boiler, a second flange of smaller diameter concentric with the outer and of slightly less depth, diaphragms or partitions extending longitudinally and trans-

versely at right angles from the inner to the outer rim, openings made near the ends of each of the compartments thus formed, pipes extending upwardly from said openings and adapted to discharge the boiling water upon the top of the clothes contained in the boiler, and an open screen in the top of the diaphragm communicating with the central chamber beneath.

**STAMP TAPPET AND SECURING MEANS THEREFOR.**—No. 763,146. June 21, 1904. Clarence Brown of Bishop, Cal., and Frank Hayes of Elmonte, Cal. This invention relates to improvements in tappets which are secured upon the stamp stems of ore-crushing mills and the like. The object of the invention is to provide a tappet which may be quickly removed in position upon a stem and quickly removed therefrom and which is prevented absolutely from slipping when once it has been secured on the stem.

**CHAIN BUCKET ELEVATOR.**—No. 763,141. June 21, 1904. H. M. Barngrover, San Jose, Cal. Assigned to Anderson, Barngrover Mfg. Co. of San Jose, a corporation. This invention relates to an apparatus for elevating substances such as prunes, dried fruit or any substance which can be transmitted by the use of such a device. The object of the apparatus is to conveniently transport prunes or similar dried fruits from a hopper or receiver into which they may be delivered, and to elevate them to floors above, where the final packing of the fruit may take place, and for similar or equivalent purposes.

#### DELINQUENT SALE NOTICE.

**EUREKA CONSOLIDATED DRIFT MINING Company.**—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice—There are delinquent upon the following described stock on account of assessment (No. 40) levied on the 10th day of May, 1904, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Brown, John.....	627	189	\$ 94½
Brown and McKinnon.....	641	100	50
Delsors, Victor.....	465	1,307	6 53½
Delsors, John.....	45	300	1 50
Delsors, John.....	60	300	1 50
Delsors, John.....	156	240	1 20
Delsors, John.....	232	140	70
Pinning, Bart.....	257	1,000	5 00
Kavanagh, Ed.....	285	300	1 50
Kavanagh, Ed.....	660	2,000	10 00
McAulay, Geo.....	69	200	1 00
Nelson, J. W.....	561	505	2 52½
Rogers and Kelly.....	690	189	94½
Smith, C. H.....	491	10,000	50 00

And in accordance with law and an order from the Board of Directors, made on the 10th day of May, 1904, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, Room 3, No. 214 Pine street, San Francisco, California, on SATURDAY, the 16th day of July, 1904, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office—Room 3, No. 214 Pine street, San Francisco, California.

#### MINING PROPOSITION.

The owners of a mining property (gold and silver), consisting of 200 acres of land, with about 2000 feet of development, water rights, pipe lines, stamp mill, roads, etc., situated in Montana, desire to get in touch with some parties who have capital and the experience necessary for the operation of such properties. The owners have spent \$120,000 on this property, and recognize that they do not possess the necessary knowledge to make a success of it. They still believe in it, and desire to retain their interest if possible, but are open to any straight deal that contemplates the working of the property successfully. Address N. Y. C. Mining and Scientific Press Office, 380 Market St., San Francisco, Cal.

### SITUATIONS WANTED.

**ASSAYER, AMALGAMATOR AND CYANIDER** will render services for salary or interest. Address "Metallurgist," this paper.

**ASSAYER, WITH KNOWLEDGE OF BOOK-**keeping, wants position with mine or mill. Address J. L., this office.

**EXPERIENCED ASSAYER DESIRES POSI-**tion with mining and milling company. Thoroughly competent in bullion, control and analytical work. Best of references. Address "Bullion," care of this office.

**EXPERT MINE FOREMAN WANTS POSITION.** Competent to handle extra difficult conditions underground. Address "Limestone," Room 602, 330 Market St., S. F.

**MANAGER OR SUPERINTENDENT FOR A** gold, silver or copper property; 20 years' experience in different parts of the country. All references. Can furnish any bond. Mexico preferred. Address D., this office.

**MILL AND CYANIDE SUPERINTENDENT** wants position. Thoroughly understands milling of gold ores and the cyaniding of same. Good assayer. Address D. A., this office.

**MINE SUPERINTENDENT IS OPEN TO EN-**gagement with a live company. Thoroughly understands his business. Address B. R., this office.

**POSITION DESIRED AS SUPERINTENDENT** to develop or operate mine and small mill; will do own assay work; would accept part salary in stock; experienced all round man; excellent references. Address "Dividend," care of this office.

**WANTED, POSITION AS SUPERINTENDENT** of mine and mill; amalgamation and concentration; competent assayer and analyst; good references. Address "Vanner," care of this office.

**WANTED—A POSITION AS ASSAYER OR TO** take charge of concentration or cyanide plant by experienced man, U. S. or Mexico. Address E., care of this office.

### HELP WANTED.

**WANTED AT ONCE, A PRACTICAL ALL** round Miner and Mill Man for gold mine now being developed in South America, Republic of Colombia. Climate good. Must speak Spanish and be able to handle peon labor. Must thoroughly understand cyaniding and other modern methods and be competent to take entire charge of mine at times in absence of superintendent. Must not be a drinking man, but a pusher. Young man with technical education and Western experience preferred. Good references required. Chance to advance. Address, stating salary expected with full particulars, South American Development Co., R. 410 Ft. Dearborn Bldg., Chicago, Ills.

### WANTED.

**WANTED—AN APPRENTICE TO SERVE A** term with the Falkenau Assaying Co., 538 Sacramento St., San Francisco, Cal. Apply between 10 and 12 or 2 and 4.

FOR USE IN  
**SMOKE or  
GAS in  
MINES.**

**PERFECT  
PROTECTION**

afforded only by the

**VAJEN HEAD PROTECTOR.**

**VAJEN-BADER CO.  
RICHMOND, IND.**

Thousands of engineers can testify to their efficiency. We want your endorsement also. Buy a Lubricator from your jobber. We guarantee it to give perfect service or money refunded. Jobbers on Pacific coast sell them.

**The Wm. Powell Co.,  
Cincinnati, Ohio.**

## LUNKENHEIMER

Suitable for all movable bearings, works only while in motion, simple and practical in construction and easily filled without detaching plug. Glass sides show stage of oil. Attach cup's glass sides are parallel with rod. When cup is in motion the oil travels in a body within the cup, and at each revolution is thrown against the feed tube, flowing down through it to the bearing—the centrifugal force, combined with the shape of the body, carrying the oil to the holes in the feed tube. Specify *Lunkenheimer* and order from your dealer. Write for catalog.

**THE LUNKENHEIMER COMPANY,  
CINCINNATI, OHIO, U. S. A.**

**CHAMPION  
ROD OIL CUP**

There are reasons why the

## JEANESVILLE MINE PUMP

is the best mine pump built.

Bulletin No. 18 explains.

**FACTS, not fairy-tales.**

See our exhibit at St. Louis,

Machinery Hall, Block 42.

**The Jeanesville Iron Works Co.**

Hazleton, Pa., U. S. A.

1328 17th St., Denver, Colo.

## U.S. Automatic Injector

### MAKE A FAIR COMPARISON.

If you are as interested as every engineer or power user should be in properly equipping his engine room, you will take the trouble to find out a few things about the U. S. Automatic Injector. You will find, on comparison, many features of superiority. One, for instance: A glance at the overflow valve of the U. S. Automatic will show that it will never wear leaky, like other injectors. Every part is built to operate without fail, and is easily exchangeable for new parts when old age makes replacement necessary. Send for our "Engineers' Red Book," containing over 500 facts of interest to engineers.

**AMERICAN INJECTOR CO., Detroit, Mich.**

## AMERICAN TOOL WORKS,

J. EASTWOOD, Prop.

**HAMMERED STEEL  
SHOES AND DIES.**

Well Boring and Drilling Tools.

ALL KINDS OF  
**STEEL FORGING.**

# "UNION" HOISTS.

15 H. P. Double Cylinder "Union" Hoist raises 2500 lbs. vertically 135 feet per minute.  
Being a double cylinder, it hoists like a steam engine.  
Drum will carry 700 ft. of  $\frac{5}{8}$  in. cable. Fitted to run on Gasoline, Benzine or Distillate.

Over 4500 "Union" engines have been sold during the past 19 years. Hundreds of "Union" hoists, in sizes from 3 to 130 H. P., and "Union" stationary engines, in sizes from 2 to 300 H. P., in actual use, have made the word "Union" synonymous with quality. Great improvements have been recently made on all of our engines.

DENVER, COLORADO.

## FOSTER VALVES

By proper regulation of the actuating power, be it steam, water, or air, the maximum output may be secured for every unit of input.

FOSTER CLASS "W" High Pressure Regulator will take care of the economy end by maintaining uniformly whatever reduced pressure may be desired, regardless of the fluctuation in initial or boiler pressure.

FOSTER BACK PRESSURE VALVE is noiseless in operation and maintains a constant back pressure without hammering or clattering.

PISTON ACTUATED PUMP GOVERNOR insures uniform resistance. It is controlled entirely by the discharge, the slightest variation of which opens or closes the steam valve instantly.

FOSTER AUTOMATIC NON-RETURN STOP VALVE looks out for the danger end; brings down the likelihood of fatality from an accident to a minimum.

You will find a FOSTER CATALOG very interesting. Send for one.

For All Kinds of Lifting.

## Why Not Try The "Triplex"

and let it talk for itself? It's a good hoist—a very good hoist because it pulls easily, lifts fast and lasts well. Ask your dealer what he knows about the Yale & Towne "Triplex" Chain Block.

It helped to set many of the heavy things in Machinery Hall, World's Fair. We're proud of it—try it, you'll be proud of it, too.

See our moving exhibit, Block 29 Machinery Hall, World's Fair.

THE YALE & TOWNE MFG. CO.

9-11-13 MURRAY STREET,

NEW YORK.

## FOR SALE.

**FOR SALE**—No. 3 Buft & Berger Mountain Transit complete, with new level rod, in perfect order.  
Address, or call, C. A. LUCKHARDT CO., 71 Stevenson St., San Francisco.

**FOR SALE—ATTENTION MINING MEN!**  
A first-class group of copper and gold prospects. Several hundred feet of work on property. A good proposition for a company. Phoenix Eastern R. R. runs through the property; 1600-foot siding on the ground. Plenty of water and wood. For particulars, write to JOHN S. COCHRAN, Kelvin, Arizona.

## I HAVE COPPER MINE,

with title from Government, located 12 miles west of Ahumada, Mexico, about 60 miles from El Paso; good road to mine from railroad; water easily obtainable; forty carloads of good ore already shipped. I wish to sell one half interest in mine (money to be used exclusively in development work) or to give bond and lease. No one without capital need apply.  
MILLARD PATTERSON, El Paso, Texas.

## FOR SALE.

### A Good Milling and Concentrating Proposition,

#### GOLD AND COPPER

Equipped with a ten-stamp mill, crusher, concentrator and slime plant, situated in El Dorado Co., Cal. Also compressor, hoisting and pumping plant, water power—all in good order.  
Or might trade the above equipment for interest in a good mining proposition, partially developed, that will bear strictest investigation.

Address "SAMOTH," this office.

## Dredging Ground FOR SALE.

Bids will be received up to August 1, 1904, for one and one-quarter miles of Secret and Miners' Ravines, near Roseville, Placer County, California, on Parry Ranch.

Ranch included, containing over 800 acres. High gravel banks on side of streams.

Gravel paid \$5 to \$9 per day to the man, with pick and shovel, in 1860.

Only a strip 50 feet wide across stream ever worked to bedrock.

Prospecting allowed to intending purchasers. Address

LARDNER & BURNS, Auburn, Cal.,

Attorneys for the Estate,

---OF---

ANDREW RYDER, Loomis, Cal.,

Executor of the Estate of Martha Pratt Parry, Deceased.

## Arthur Koppel's Forged Steel Shoes and Dies

are of the right hardness and toughness; of the best quality in every way. Wear longer and more evenly and crush a ton of ore cheaper than any other. Patterns of all standard sizes kept in stock to ensure quick delivery.

WE ALWAYS CARRY A LARGE STOCK OF

Steel Dump Cars; Ore, Mine and Skip Cars; Steel Rails from 8 lbs. up, Turntables, Switches, Etc.

WRITE FOR CATALOGUE "F."

**ARTHUR KOPPEL,** Manufacturer of Industrial, Narrow and Standard Gauge Railway Materials,  
DEPT. 6, 66-68 BROAD STREET, NEW YORK.  
HARRON, RICKARD & McCONE, Pacific Coast Agents, 21-23 Fremont St., San Francisco, Cal.

## FRANCIS SMITH & CO., Manufacturers of

## SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., All Sizes.  
83 FREMONT STREET, SAN FRANCISCO, CAL.

WATER AND OIL TANKS—ALL SIZES. Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making pipe.  
Estimates given when required. Are prepared forcoating all sizes of Pipes with Asphaltum.

## MACHINERY FOR SALE.

## AN OPPORTUNITY

### Greatly Reduced Prices!

We have in stock and are offering at greatly reduced prices the following list of new machinery:

- 1 Giant Steam Driven Compressor, 8x9x10 in.
- 1 Giant Belt Driven Compressor, 12x14 in.
- 1 Giant Rock Drill, 2½ in.
- 1 Giant Rock Drill, 2½ in.
- 1 Giant Rock Drill, 3½ in.
- 1 Leffel Steam Engine, 6½x10.
- 1 Leffel Steam Engine, 8x10.
- 2 Feed Water Heaters, 35 H.P. and 50 H.P.
- 1 Boiler Feed Pump, 3x2x3.
- 1 Boiler Feed Pump, 7x4x7.

Prices and information upon application.

## John Wigmore & Sons Co.

236-240 S. Los Angeles St., LOS ANGELES, CAL.

- 1 Davis Chilian 5½ ft. Mill.
- 1 Huntington 6 ft. Mill.
- 4 Revolving Screens and Housings.
- 1 Ball Pulverizer.
- 2—1000 lb. Chlorination Barrels.
- 2—16x4 Redwood Cyanide Tanks.
- 12 Smaller Cyanide Tanks.
- 1—6x8 Fairbanks Hoist.
- 1—7x10 Hendrie & Bolthoff Hoist.
- 1—15 H. P. Dake Hoist.
- 1—4x6 Hendrie & Bolthoff Hoist.

## The S. S. Machinery Co.,

THE PIONEER MACHINERY HOUSE OF THE WEST  
2465 LARIMER ST., DENVER, COLO.

## FOR SALE.

- 1---8x10 Double Engine, Double Drum Steam or Air Hoist, "spread out" type.
- 1---Duplex 12x18 Air Compressor, direct driven; 16 ft. Pelton Water Wheel on Crank Shaft.

Both machines our own make; used less than a month; can be seen on foundations near Jamestown.

Address ANGELS IRON WORKS, Angels Camp, Cal.

**For Sale**—Elevator Gold Dredger, Electrically operated. Bucyrus make. Five-foot buckets. Practically good as new. For full particulars, write  
Bedrock Dredging Co., Placerville, Idaho.

We can furnish you anything in the way of mining or milling machinery, with machinery which has had from fifteen days to four months' use, and save you from 25% to 50% on your purchase. Write us for prices and specifications.

## Bargains in Second-Hand Machinery.

- 1—7"x10" Double Cylinder Single Drum Hoist.
- 1—8"x8" Single Cylinder Single Drum Hoist.
- Tubular, Fire Box and Upright Boilers of all sizes.
- Corliss, Automatic and Plain Slide Valve Engines.
- Steam and Power Pumps of all sizes.

- 1—650-Light Dynamo.
- 1—14x10x10 Duplex Steam Pump.
- Shafting, Pulleys and Belting.
- Saw and Planing Machinery.

McMASTER-PIEPER MACHINE CO., 512 Folsom Street, San Francisco, Cal.

### The CLIPPER Drill

The Drill That DRILLS

30 Years experience has taught us how to produce

**Results**

Machines for drilling Water, Oil, and Gas Wells. Testing, Blasting, Prospecting coal fields, placer grounds, etc., using either Solid or Hollow Pipe Tools.

**LOOMIS MACHINE CO., TIFFIN, Ohio.**

## FOR SALE AT LOW PRICES.

- AIR COMPRESSORS.**
- 20x20x24 Ingersoll-Sergeant straight line.
- 20x24x24 National.
- 9x16x9 Clayton duplex.
- 8x6x12 Westinghouse.
- 10x9x10 Hughes single acting.
- 7x7x5x7x9 Westinghouse duplex.
- 7x7 Clayton belt driven.
- 9x9x9 single.
- HOISTING APPARATUS.**
- 10x14 double cylinder, single drum Marinette hoisting engine.
- 12x16 double cylinder, single drum Marinette hoisting engine.
- 18x24 M. C. Bullock hoist.
- 8x10 double cylinder, single drum Webster, Camp & Lane hoist, drum 36x36.
- 5 ton Scoville locomotive traveling crane.
- 64x8 double drum, double cylinder hoisting engine and boiler.
- 5x8 double drum, double cylinder hoisting engine and boiler.
- 64x8 double cylinder, double drum hoist, without boiler.
- 5x8 without boiler.
- MISCELLANEOUS.**
- Groton crusher, complete with elevator and screen, portable type.
- Bullock Champion diamond prospecting core drill.
- U-A Sullivan drill for air.
- U-C Sullivan drills for steam.
- U-E Sullivan drills for steam.
- U-E No. 2 Sullivan drill for steam.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

PITTSBURG, CHARLESTON, W. VA.  
BUFFALO, PHILADELPHIA.

JOSHUA HENDY MACHINE WORKS, San Francisco Agents for Electric Mine Locomotives.

HENSHAW, BULKLEY & COMPANY, San Francisco Agents for Elevating and Conveying Machinery.

## Hemlock Knots

A popular material for machine bearings. But this was when our grandfathers "settled up the country" and made their own grindstone frames and horse powers. The world has moved, since then, over an OCEAN OF OIL, running to waste.

MACHINERY BUILDERS and users have learned that there is economy and efficiency in using our

**GRAPHITE AND BRONZE BEARINGS**  
THAT RUN WITHOUT OIL.

## The Graphite Lubricating Co.

Church Street, Near Main,  
BOUND BROOK, N. J. U. S. A.

## Riveted Iron and Steel Pipe

FOR HYDRAULIC MINES, IRRIGATION AND POWER PLANTS. Manufactured from the best grades of IRON or STEEL by MODERN MACHINERY.

**THE SCHAW-BATCHER COMPANY PIPE WORKS,**  
539 MISSION STREET, 211 to 219 J STREET,  
San Francisco. Sacramento.

## WE DESIGN COMPLETE TRANSMISSIONS.

Give Us Your Problem in SPUR, BEVEL, SPIRAL and RAWHIDE

## GEARS.

CUT OR CAST IN ANY SIZE. WRITE US.  
**Pacific Gear & Tool Works,**  
(Successors to P. T. TAYLOR.)  
529 MISSION STREET, SAN FRANCISCO, CAL.

## CARY SPRING WORKS,

240 & 242 WEST 29th STREET, NEW YORK, U. S. A.

Telephone, 3346-38th St.

**WIRE SPRINGS**  
OF EVERY DESCRIPTION.

Manufacturers of  
All kinds of ROUND and FLAT WIRE,  
TEMPERED and UNTEMPERED  
**SPRINGS**  
For Machinery, Rolling Shutters, Motors, Etc.

MUSIC BOX AND FINE SPRINGS OUR SPECIALTY.

## New Edition.

## AARON'S ASSAYING—PART I.

THE FIFTH EDITION OF THIS STANDARD WORK appeared March 25. It is rewritten, and carefully edited; retains all the excellencies of former editions and is thoroughly modernized.

IN THE PREFACE THE PUBLISHERS SAY:

The advance in the present state of the art, and the consequent present requirements, have made necessary revision and rewriting of this work throughout, and the fifth edition is presented in the hope that it will be accorded the same measure of profitable approval given the earlier editions of this standard work.

San Francisco, March 25, 1904.

ANY ONE INTERESTED IN ASSAYING, WHETHER YOUNG OR old, will find this book of value to him.

SENT POSTPAID ON RECEIPT OF PRICE—ONE DOLLAR  
Address

**MINING AND SCIENTIFIC PRESS,**

### CHEMICAL ENGINEERS.

Dearborn Drug & Chemical Works, Chicago.

### CHROME STEEL.

Chrome Steel Works, Brooklyn, N. Y.

## THE BOSS CAN'T KICK AT THE MAN WHO KNOWS "EUREKA ROB" ON THE INDICATOR.

If the boss discovers the business  
don't pay,  
On the engineer the blame he  
throws,  
And you'll have to hear it day after  
day  
Unless you can PROVE you're a  
man who knows.

There's no use telling "the engine's  
wrong,"  
Unless you can show where the  
money goes;  
There's nothing but PROOF will  
stop his song—  
The boss can't kick at the man  
who knows.

## A Robertson-Thompson Indicator

The faults of the engine will soon  
expose;  
It'll make her confess them in  
black and white  
And PROVE you're a man who  
KNOWS he knows.

It's the best indicator on the mar-  
ket to-day,  
Sold at a price you're willing to  
pay.  
The name of the makers is ample  
backing,  
They make HINE ELIMINATORS and  
EUREKA PACKING.

Write to-day for our free booklet on INDI-  
CATORS, ELIMINATORS, ETC.

JAS. L. ROBERTSON & SONS,  
204 FULTON ST., NEW YORK.

and Scientific Books, 92 pages, 8vo., a Catalogue of  
Books on Metallurgy, Mining, Prospecting, Min-  
ing, Geology, Assaying, Analysis, etc.; a Catalogue  
of Books on Steam and the Steam Engine, Machin-  
ery, etc.; a Catalogue of Books on Sanitary Science,  
Gas Fitting, Plumbing, etc.; and our other Cata-  
logues and Circulars, the whole covering every branch  
of Science applied to the Arts, sent free and free of  
postage to any one in any part of the world who will  
furnish his address.

**DEPARTMENT OF THE INTERIOR, U. S.**  
Geological Survey, Washington, D. C., May 26,  
1904. Sealed proposals, in duplicate, will be  
received at the office of the United States Recla-  
mation Service, at Reno, Nevada, until 2 o'clock  
P. M. July 15, 1904, for the construction of about 37  
miles of main distributing canals, involving about  
1,500,000 cubic yards of earthwork, with diverting  
dam, regulating gates, spillways, falls, weirs, and  
bridges, for the diversion and conveyance of about  
1,800 cubic feet of water per second from Carson  
River at a point about 4 miles west of Lettville,  
Nevada, to irrigable lands in Carson Sink Valley.  
Bids will be received on (A) Excavation and em-  
bankment for one or more divisions or all the  
work. (B) Headworks. (C) Falls, spillways,  
weirs, lateral headgates, and pipe drains. (D)  
Highway bridges. Specifications, form of pro-  
posal and particulars may be obtained after  
May 26, 1904, by application to L. H. Taylor, Reno,  
Nevada, and to the Chief Engineer of the Recla-  
mation Service, Washington, D. C., at whose offices  
the plans may be inspected. Each bid must be  
accompanied by a certified check of \$1,000, payable  
to the Secretary of the Interior, as a guaranty that  
the bidders will, if successful, promptly execute a  
satisfactory contract and furnish bond in the sum  
of 20 per cent for the faithful performance of the  
work. The right is reserved to reject any or all  
bids, to waive technical defects, or to accept one  
part of a bid and reject the other, as the interest  
of the service may require. Proposals must be  
marked, "Proposals for Distributing Canals,  
Truckee-Carson Project, Nevada." Bidders are  
invited to be present. THOS. RYAN,  
Acting Secretary.

REMEMBER,  
Leviathan Belting

may be subjected to the most excessive conditions, be they heat, steam or moisture, without injury. NO PARTS TO SEPARATE.

WILL OUTWEAR TWO RUBBER BELTS.

MAIN BELTING COMPANY,

55-57 Market Street, Chicago.

Philadelphia, Boston, Buffalo.

CONVEYORS  
and  
ELEVATORS.

24 IN. INVERTED SYPHON.

Wheeler Patent  
Continuous  
Wooden Stave Pipe.

For any purpose for which  
Cast Iron is used.

For Mining Construction it is cheaper than high  
treble flumes, and many times as durable. No ex-  
pense for maintenance.

1 to 10 feet diameter. Pressure to 130 pounds  
per square inch.

Estimates Furnished. Catalogue on Request.

## National Wood Pipe Company,

GENERAL OFFICES;

Sixth and Mateo Sts., LOS ANGELES, CAL.  
SAN FRANCISCO OFFICE, 301 Market Street.

**I** BELIEVE that in general the publisher is anxious that his paper shall pay the advertiser, because, otherwise he cannot expect to hold him. It is, therefore, of the utmost importance that the purchaser of space should know exactly what he may expect, and if there is the least suspicion that it will not pay, the publisher should be the first to point it out. He may lose an advertiser, but he will win a friend, which may sometimes be of equal value. In the scramble to secure business some publishers may lose sight of the fact that not to everyone can they be of value, and find, later, that reports are rife that their paper is not a payer. To go a step further, I do not know any reason why publishers should not pick out their customers same as the advertiser picks out his papers—by the showing in the way of returns.—F. A. SOUTHWICK.

# LINK-BELT

**TROUGHING IDLERS  
ARE EQUIPPED WITH  
BALL BEARING ROLLS.  
The Belt Itself**

is the vital and costly part of a belt conveyor and even the most costly belt is quickly destroyed by frictional resistance from its supporting rolls.

**WE MAKE THE ONLY TROUGHING IDLERS EQUIPPED WITH BALL BEARINGS,**

which reduce this resistance to an insignificant factor.

Consequently our belt conveyors consume less power and the belts last longer than when any other type of roll is employed.

**PERMIT US TO SUBMIT PLANS AND ESTIMATES COVERING YOUR WORK.**

**LINK-BELT MACHINERY CO.**

DENVER OFFICE: 922 17th St.  
A. E. Lindrooth, Mgr.

CHICAGO

**FOUR ROLL IDLERS**  
(For Wide Belts).

THE POSITIONS OF THE ROLLS CONFORM AS NEARLY AS POSSIBLE TO A NATURAL AND UNIFORM CURVE.

The fibre stress resulting from abrupt bends rapidly destroys the best belt.

**THREE ROLL IDLERS**  
(For Medium Belts).

BY DEEP TROUGHING, DURABILITY IS SACRIFICED TO CAPACITY.

**OUR SHALLOW TROUGH BELT CONVEYORS**

have no larger capacities than is consistent with sound economy.

## FULTON ENGINE WORKS,

## SAMSON TURBINE

The illustration shows the large NIAGARA design, HORIZONTAL SHAFT TURBINES recently installed by us for the TELLURIDE POWER TRANSMISSION CO. power station, Logan, Utah. Tests conducted by competent engineers developed as follows:

Head.	Gateage.	Speed.	H. P.	Generator Eff'cy.	Turbine Eff'cy.
211.5 ft. ....	1-2 .....	400 r. p. m. ....	1038 .....	.952% .....	.738% .....
209.7 ft. ....	3-4 .....	400 r. p. m. ....	1560 .....	.965% .....	.8359% .....
208.9 ft. ....	Full .....	400 r. p. m. ....	1677 .....	.967% .....	.8057% .....

These results have never been equaled by any turbine of the Horizontal Shaft Design, operating under equally HIGH HEADS. The test was made after turbines were installed in position, direct coupled to Generators. Francis' weirs and formulae for discharge were used. The original test reports on file at our offices. These turbines are all fitted with our SAMSON BALANCED GATES.

Write Dept. "AA" for catalog.

## THE HAMILTON LOADING MACHINE---Built to Load Ore in Mines.

Works in veins as low as four feet, and requires ten feet of room at the face. Has a radial arm or sweep which scoops up the ore as it lies on the mine floor and conveys it into the mine car. Has a capacity of twenty cubic feet per minute and will handle large lumps. Mechanically gathers all ore lying within a radius of twelve to sixteen feet from the end of the track. The machine is self-propelling. It is equipped with car pulling device and handles its loads and empties to and from the cross entry. Larger types of this machine are adapted to outside use where loose material is to be handled. Equipped for compressed air or electric power. Fully protected by United States and foreign patents.

THE HAMILTON MFG. CO., 48 Deshler Blk., Columbus, O.

JESSOP'S STEEL

I. WILLARD BEAM, Agent,  
29 MAIN STREET,  
SAN FRANCISCO, CAL.

(CONTINUED ON PAGE 36.)

The **WEBER PATENT COMPRESSION GRIP** requires no lugs or knots of any kind on the traction rope, giving longer service, and saving in repairs.

The **PATENT LOCKED-COIL TRACK CABLE** gives much greater service than other cables, and adds correspondingly to the life of the rolling stock.

Manufacturers, Engineers, Contractors and Sole Licensees  
in North America for the

# BLEICHERT SYSTEM OF WIRE ROPE TRAMWAYS

Bleichert Tramway of the  
United States Mining Co.,  
Tingham, Utah.

Only system equipped  
with the Patent Locked-  
Coil Track Cable and  
Webber Patent Compression  
Grip or Bleichert  
Patent Automatic Grip, with  
Patent Automatic Attach-  
ers.

**THE MOST ECONOMIC  
IN COST OF OPERA-  
TION.**

**MORE BLEICHERT TRAMWAYS IN USE THAN ALL OTHERS.**

Also, Wire Rope Equipments for Cable Hoist-Conveyors, Surface and Underground Haulage, Etc.

ILLUSTRATED BOOK ON APPLICATION.

New York Office, 17 Burling Slip.  
Denver Office, 1711 Tremont St.

San Francisco Office, 34 Fremont St.

Chicago Office, 1122 Monadnock Building.  
Philadelphia Office, 614 Betz Building.

## Now Ready! A Popular-Priced Edition of Appleton's Cyclopaedia of Applied Mechanics.

Edited by PARK BENJAMIN, Ph.D., LL.B.

**A SET IN THREE VOLUMES, FULLY ILLUSTRATED!**

Bound in half morocco, each volume containing over 900 pages, with nearly 8000 engravings, including diagrammatic and sectional drawings, with full explanatory details.

**SPECIAL PRICE, - \$12.**

The publishers' price of this work has been \$22.50 and it has been sold only by subscription.

We have a Special Edition of this work and will ship prepaid the three volumes to any address in the United States or Canada on receipt of the above price. Thus you save about half the original price and have a technical cyclopaedia and dictionary, the usefulness of which has been testified to by a multitude of purchasers.

**AS A REFERENCE WORK IT IS OF GREAT VALUE!**

Containing upwards of 10,000 topics, 2700 pages, nearly 8000 engravings. The standard of American mechanical practice in workshops, manufactories, technical schools, and libraries.

Add \$1 Extra for Expressage to England and the Continent, or \$2 Extra to Australia and other Countries.  
Special Circular of contents of these volumes sent free. A 40-page Catalogue sent FREE on request.

EACH VOLUME 10x7x2. WEIGHT 20 LBS.

ADDRESS  
BOOK DEPT., **THE MINING AND SCIENTIFIC PRESS,**  
720 PARK ROW BUILDING, NEW YORK CITY, N. Y. 1164 MONADNOCK BLOCK, CHICAGO, ILL.  
606 MACK BLOCK, DENVER, COLO. 330 MARKET ST., SAN FRANCISCO, CAL.

## ASSESSMENT NOTICES.

**MARINA MARSICANO GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of May, 1904, an assessment (No. 38) of five (5) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 415 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of July, 1904, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of August, 1904, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
CHAS. BOVONE, Secretary.  
Office—415 Front street, San Francisco, California.

**NATIONAL CONS. MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of June, 1904, an assessment (No. 18) of five (5) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1904, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 27th day of August, 1904, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
GEO. W. FLEISSNER, Secretary.  
Office—773 Mission street, San Francisco, California.

## WEALTH IN SIGHT.

The Territory tributary to the

## Santa Fe System

In INDIAN TERRITORY, TEXAS, COLORADO, NEW MEXICO, ARIZONA and CALIFORNIA, offers to limited investments of capital, backed by energy and brains, unusual opportunities for development of GREAT MINERAL PROPERTIES.

Deposits of the following are known to exist on and within a few miles of our lines:

Antimony, Alum, Asbestos, Asphalt, Barytes, Bauxite, Borax, Cement Rock, Coa Cryolite, Clays of all kinds, Copper, Gold Graphite, Gypsum, Granite, Iron, Kaolin, Lead, Lithograph Stone, Manganese, Mica, Marble, Mineral Paints, Nitre, Nickel, Natural Gas, Onyx, Petroleum, Phosphate Rock, Pumice Stone, Pyrites, Quicksilver, Salt, Silica, Strontianite, Stone—Oolite, Lime and Sand, Silver and Zinc.

For further information, address

**WESLEY MERRITT,**  
Industrial Commissioner,  
Atch., Top. and Santa Fe System,  
CHICAGO, ILL.

## THE "Little Demon" Power Hammer

"Will forge anything from a needle to a crankshaft."

A boon to blacksmiths. Just the thing to sharpen drills in a mine. Efficient, simple and durable.

Price reasonable. Write for circular.

**J. C. HOWLETT  
MACHINE WORKS,**  
256 Fremont Street,  
San Francisco.

**THE CALIFORNIA DEBRIS COMMISSION** having received applications to mine by hydraulic process from Amador and Sacramento Irrigation and Mining Co., in Dunderhead Mine, at Michigan Bar, Sacramento County, Cal., draining into Cosumnes River; from W. E. Duncan Sr., in York Ranch Placer Mine, near Spanish Ranch, Plumas County, draining into East Branch of North Fork of Feather River; from E. V. Tiffany and Seth Jenkinson, in Treasure Point Mine, near Fair Play, El Dorado County, Cal., draining into Cedar Creek, which reaches South Fork of Cosumnes River, gives notice that meeting will be held at Room 96 Flood Building, San Francisco, Cal., July 5, 1904, at 1:30 P. M.

## Mines That Do Not Go Down.

There is a strong prejudice in favor of fissure veins—those of illimitable depth, whose downward extent can never be bottomed by human ingenuity and persistent effort. The reason for this preference is not difficult to find, for some of the richest mines of the world are of this type. The Comstock lode of Virginia City, Nevada; the Ontario veins of Park City, Utah; the Silver King of Pinal county, Arizona; the Granite Mountain and Drum Lummon of Montana; the fissures of the gold mines of the central gold belt of California; the Smuggler-Union and Camp Bird mines of Colorado; the tin and copper producing veins of Cornwall, which have been continuously worked for centuries—these and many others are of distinct fissure type, and their output has formed a basis for the prejudice in their favor. But what of the blanket vein; the irregular deposit; the low lying vein, and the sheets of ore found at or near the contact of sedimentary beds and igneous intrusive rocks?

The mines of Leadville are mostly contact deposits in limestone; the ore bodies in the Cambrian formation in the Black Hills are nearly all flat sheets in sedimentary beds, often capping or lying near the summit of hills. The mines of the Missouri-Kansas lead-zinc field are irregular deposits in limestone, few of the mine workings being over 300 feet deep and

most of them less than 200 feet; the large and rich copper deposits of Bisbee and Globe, Arizona; the deposits of Cananea, Mexico; many of the mines in Salt Lake county, Utah, are similar to those of Leadville, Colorado. The noted Mount Morgan mine of Queensland, Australia, is not a fissure vein, but a great deposit occupying the upper portion of a hill and extending downward to what depth has not yet been determined. These flat and irregular deposits and veins have produced hundreds of millions of dollars in gold, silver, copper, lead and zinc, and they have, as a class, proven to be relatively more profitable when viewed from the standpoint of cost of equipment, development and operation than the deep fissure veins. Of course there are exceptions, among them being those veins so situated that they could be worked to great depth by means of adits. Veins thus fortunately situated may often be worked cheaper than flat veins, as gravity aids in reducing the cost of mining. The equipment of some deep fissure mines is elaborate and necessarily expensive where the mines are operated through shafts, for ventilation and drainage must be provided, and the hoisting engines are usually designed to raise heavy loads at high speed from a depth of 1000 to 4000 feet, and this requires expensive installation.

On the other hand the "mines which do not go down," but occur at or near the surface, require a minimum of expense in equipment, and are generally worked at a higher profit than the deep fissures going down thousands of feet below the surface.

The bedded veins and irregular deposits do not all occur at the surface, however, nor always outcrop, and in such instances they are as expensive to operate as the fissure or steeply inclined vein. There is little can be said against the bedded vein beyond the fact that it is usually of limited and known extent, but it possesses, as against this, the virtue of the capability of being worked out, and when the ore is exhausted the miner expends no money in what he knows must be a futile search for more ore.

**R**ARELY is a mill building constructed in mountainous regions where it is not necessary to do more or less grading before placing the machinery and proceeding with the construction of the building.

Various are the methods by which the grades are made. In some instances shovels, picks and wheel-

barrows are the principal tools employed; in others the magnitude of the operations justifies the employment of cars or wheeled scrapers. In a few instances, where the topography of the ground permitted it, and no buildings or other structures were near to be damaged by the operation, heavy blasts have been placed and thousands of cubic yards have been displaced and hurled down the slope at one time, thus saving much expense in shoveling and wheeling the earth and broken rock. The most inexpensive way to grade for buildings of this character, however, where conditions admit of it, is by piping the earth and loose rock away, as in hydraulic mining. One of the engravings on this page shows this work in progress at the Fairview mill, Trinity county, California, preparatory to extending the building and increasing the capacity of the mill by placing additional stamps. The stream of water, under heavy pressure, tears away the earth rapidly and carries it down the hill, out of the way, laying bare the underlying rocks, which may then be removed by blasting, if necessary, with the creation of a minimum amount of fines, and the rock broken used to advantage in forming a level space beyond the mill, the larger and more suitable pieces being reserved for walls.

THE mining districts of Mexico are complaining of a scarcity of native labor. This is something new for Mexico, and is an indication of the rapid development of her mineral districts under the new condition of things. The scarcity of labor in the mining districts is partly accounted for by the statement that the ranchers of the valleys are offering a higher wage rate than ever before for men to work on the haciendas, and as the majority of men prefer this sort of outdoor work to labor underground they desert the mountains for the valleys, despite the fact that the radical change in climate and altitude is in so many cases fatal to the lower class of Mexicans, for they cannot readily accommodate themselves to the climate of the "hot country." The cities teem with laborers who eke out a slender existence on the uncertain employments and low wages that such communities afford, but who will not willingly exchange city for country life under any circumstances.

RECENTLY some very interesting and possibly important experiments have been made in electro-metallurgy. Among these is the manufacture of steel direct from carbon-pig iron and scrap in an electric furnace of the induction type. This has not only been accomplished, but has been adopted as a satisfactory process and an economic success in Sweden. The process is described as being analogous to the crucible steel process, though possessing an advantage over the latter by reason of all deleterious gases being excluded from the melted charge. In France steel is made by electric process from scrap. Another innovation in electro-metallurgy is the estimation of gold in solutions containing it. By electric process, also, the manufacture of large amounts of silicon are now possible. As yet we are only in the experimental stage in electro-metallurgy. What the next decade may bring forth it is scarcely possible to anticipate, so great seem the possibilities of the future in the field of electricity.

## Evolution of Mining in Colorado.

In certain portions of Colorado many of the mines are shipping less ore than formerly to smelters, and this has led some to think that the mines were being exhausted and that the future of mining in Colorado would, in consequence, be limited to a few years, and then would practically cease altogether. How erroneous this conception of the mineral resources of Colorado is, is best appreciated by those most familiar with the resources of that State. There are still many districts in Colorado practically in their infancy, as yet developed to a comparatively slight degree, and it is assuming something improbable to say that no new districts remain to be discovered. With the extension of railways and the further construction of good roads and trails, many new districts remain to be discovered, and some other sections, long known to be mineral bearing, will be opened up. There are known to be large mineral veins in Eagle county, in the Holy Cross region, but nothing has been done with them for years. The region about Leadville still contains mineral resources not yet touched, and what is true of Lake and Eagle counties is true of almost every other mineral county in the State. Colorado has grown up out of a most fortunate condition as to the distribution and value of its surface ores—they were rich—and for years Colorado was known as the "poor man's country." This for two reasons: First, the ores were outcropping on the surface of the hills and mountains, and they were rich—often very rich. Second, the poor prospector, with no capital other than his tools and grub, and a determination to succeed, could dispose of a single sack of ore at the nearest smelter, and return to his prospect for another sack, increasing his shipments as his capital grew from ore sold.

This fortunate combination of circumstances—rich ore and custom smelters, which would buy ore in any amount—made Colorado what it is to-day, one of the greatest mining regions in the world. As years came and went the industry grew greater year by year and the smelters were enlarged to keep pace with the output of the mines, and while it is true that many mines no longer send the large amounts of ore to the smelter that they did formerly, the greatly increased number of shippers is accountable for the fact that the smelters are to-day handling more ore than ever before in their history. The reason for decrease in ore shipments from some of the mines to the smelters is due, not to failure of the mines, but to the fact that many of the larger mines are working at a greater depth, and though they still have abundant ore, it is of lower grade than formerly, and much of it is being treated in plants built at the mines. The development of a high class of concentrating machinery, making it possible to handle large tonnage at low cost, has made a great change in the destinies of many mines, where they are handling a far larger tonnage than formerly, but are concentrating five and ten into one, and only the concentrates are shipped. The introduction of the cyanide process, and its successful application to the treatment of base and low grade ores, has been another factor in diverting ore from the smelters to the plant of the company, or to local custom plants. Every mine manager strives to maintain the output of his property, while endeavoring at the same time to decrease cost, and where possible, this is being done by concentrating, cyaniding and otherwise treating the ore in works owned by the mines, instead of shipping, as formerly, to the smelters. But so long as no labor troubles interfere with the steady production of the mines, the smelters still have abundance of ore and will doubtless have for years to come.

A GREAT DEAL has been said in regard to the operation of dredgers in the valleys of California rivers, some claiming that the tailings (silt), a natural result of their work, is filling the channels and slowly rendering the navigation of the streams impossible. As a matter of fact the dredgers are working in interior ponds, not connected directly with the rivers. Others complain that the land over which the dredger has operated is ruined for all time, viewed from an agricultural standpoint. This latter assertion is doubtless true if no steps be taken to rejuvenate the land, but it seems an easy proposition to turn the river upon the lands which have been

dredged, and the sediment contained in the waters, as a natural result of mountain erosion, would settle over the barren cobbles and boulders and in a few years the valley would again become a prolific agricultural tract.

## How Some Mines Are Promoted.

One of the most serious drawbacks to the floating of new mining enterprises is the high valuation placed on a property of intrinsically small relative value. A prospect may be opened and developed until it becomes a mine having an actual net valuation of, say, \$100,000, with a prospective value of double that amount. The mine is bonded for, possibly, \$250,000 on the deferred payment plan, and then the proposition is incorporated and capitalized for, perhaps, \$5,000,000, with a million shares at \$5 each. The promoters take about 300,000 of these shares for their trouble and 400,000 shares are offered to the public at the low price of \$1 per share, the remaining 300,000 shares being placed in the treasury to be sold later, if necessary, to carry on development or to provide equipment, or to be absorbed by the promoters if the venture proves successful. Under the impression that stock offered at 20% of its face value must be a good investment, the public pays \$400,000 for a two-fifths interest in a mine having a doubtful though possible total value of \$200,000. The natural outcome of this method of procedure is numerous failures. Even if the property proves a success, viewed from the basis of its true valuation at the time of incorporation and promotion, it still may fall far short of realizing the expectations of the investors. The property may pay \$500,000 net profit, which would entitle it to be included among good mines; but the public who bought in on a basis of \$1,000,000 only receive 50 cents on the dollar on their investment, and, as far as they are concerned, the proposition is a failure. This is but a single instance of mine promotion, and with little change may represent any one of a large number of flotations. If mines were generally promoted on a more conservative basis, there would be more successes recorded, and the investing public would seek mining investments in preference to other stocks. In contrast to the above described method of mine promotion, some of the greatest producing and most profitable mines in the world are capitalized for amounts far below the dividends they have already paid. Of course, any mine making a good showing at the beginning may prove to be one of the bonanza mines, but in its early history this is usually only a possibility. Moreover, it is really not so much the capitalization of the proposition as the price at which investors buy into the enterprise that is to them the true measure of success or failure.

THE mill of the Tinton Company, at Tinton, in the Nigger Hill section of western Lawrence county, South Dakota, has the distinction of being the only concern in America at present crushing and concentrating tin ore. The ore occurs in large dikes of coarse granite (pegmatite) and is similar to that occurring in the Harney Peak region, 65 miles to the southeastward, and where a large amount of exploratory work has been done in similar dikes. Several mills have also been built in past years to treat this ore by concentration, but none of them continued in operation long after construction. At Tinton, however, it is stated that 100 tons of tin-bearing greisen are daily crushed and concentrated, the cassiterite to be shipped to Eastern works for reduction. The mill has been in continuous operation for several months, and is said to be a success. Thus far tin mining in the United States has not been a success. Whatever may have been the cause for cessation of operations in the southern Black Hills, in southern California, at the San Jacinto estate, it was undoubtedly partly due to insufficient development of the tin-bearing veins. Possibly if these latter mines were properly developed they might be made a profitable operation. At one time during the brief career of this company there were over 120 men on the payroll and but four men employed in the mine. The amount of ore in sight and accessible would not have kept a 5-stamp mill employed, and still an elaborate plant was built to treat ore not known to exist. It is enterprises conducted on this extravagant manner that make failures damaging to mining.

## CONCENTRATES.

CYANIDE PLANTS are operating in California in San Diego, Riverside, San Bernardino, Kern, Mariposa, Tuolumne, Calaveras, El Dorado, Placer, Nevada and Shasta counties, and possibly elsewhere not reported.

THE Land Commissioner decided some time since that forest reserves may be entered for the purpose of prospecting for mineral deposits therein, but the National parks, Yosemite and Yellowstone, and military reservations, are not included in this order.

THE length of belt in a coil may be estimated approximately by adding the diameter in feet of the hole in the center of the coil to the diameter in feet of the whole coil, multiplying this sum by the number of coils, and this product by 0.1309, which will give the number of feet in the coil.

THE average velocity of water in an ordinary ditch or flume is estimated to be about 80% to 84% of its maximum velocity. The average velocity is greater or less according to the character of the bottom and banks or sides of the ditch or flume and to the number and sharpness of the curves.

THE cheapest hydraulic mining reported in California was at a claim near Iowa Hill, Placer county, where gravel containing 3 cents per cubic yard is said to have yielded a profit. The gravel was easy washing, and with abundance of water a large amount was moved daily at minimum cost.

THE cost of a ditch varies with its size, and principally with the character of the material through which it is dug. The cost for large ditches carrying 2000 to 3000 miners' inches has ranged in California between \$5000 and \$8000 per mile. Where extensive fluming is included the cost will reach the higher figure.

IT is estimated that in a pipe line 4000 feet long with 4 inch diameter, delivering 26.6 miner's inches of water under a head of 140 feet, the friction is about equal to the head, and that to get power from such a line the pipe must be larger, which will admit of the same flow of water at decreased velocity and consequently less friction.

THE details of a tunnel flume 6 feet wide, 12 feet long and 32 inches deep is as follows: Eight posts 4x6 inches by 3 feet 2 inches long; four sills 4x6 inches by 8 feet long; six bottom planks 2x12 inches, 12 feet long; four side planks 1 1/2 inch by 16 inches, 12 feet long; two top rails 2x8 inches, 12 feet long; sixteen side braces 2x4 inches, 2 feet long.

THE displacement of rock formations by faults is not always at right angles to their strike. There is nearly always more or less lateral displacement as well, and this fact may deceive miners who are in search of the continuation of a faulted vein. Reverse faults are as common as normal faults. On the mother lode of California both normal and thrust faults occur, as well as faults at right angles to the strike of the veins.

WHEN the right of a claim owner to follow his vein on its dip beyond the side lines of his claim and under the surface territory of another is challenged, the claim owner must be able to show the apex of the vein within the surface boundaries of his claim to the extent necessary to cover the disputed segment of the vein; also to be able to establish the identity and continuity of the vein from its apex or outcrop to the point of dispute.

THE first Bessemer patent to make steel from iron by pneumatic process (bessemerizing) was issued in 1856, but the process did not come into practical use until years after. From 1866 to 1871 several attempts were made at bessemerizing copper mattes, but it was not before 1878 that the process of converting copper matte became a success, when it was accomplished by John Holloway at the Cammell Steel Works at Penistone, England.

CORUNDUM is an aluminous oxide and is next to the diamond in hardness. It is used chiefly as an abrasive in the form of emery, either powdered, in pressed blocks or in wheels. It is being largely displaced by the manufactured mineral called carborundum, which has a superior hardness and is more regular in composition, being free from foreign admixtures. Fine colored, transparent corundum is known as sapphire, oriental ruby, oriental topaz, etc.

MERCURY unites chemically and mechanically with many other elements. In the former combination they are known as chemical compounds, such as mercuric chloride (corrosive sublimate). The mechanical combinations of mercury with other elements are known as amalgams. Thus mercury combines with gold and silver forming amalgams. There are numerous other elements with which mercury amalgamates, thus there are sodium and potassium and zinc and tin amalgams.

TWO PER CENT cyanide solutions are rarely used in treating ores. It is more common to find the solutions

with a strength of 0.25% or 0.20%. The 2% solution is sometimes made and kept in stock and used to strengthen weak solutions to aid precipitation in the zinc boxes. The use of sodium cyanide is becoming more common. It is less expensive to manufacture than potassium cyanide and contains a larger amount of cyanogen. Most potassium cyanide contains more or less sodium cyanide.

THE various elements known to chemistry differ in their power to hold in combination other elements. Atoms of every element have the power of holding in combination atoms of one or more elements. This property is known as valence, and the valence of an atom is its capacity to hold in combination other atoms or groups of atoms. Thus water is composed of hydrogen 2 atoms and oxygen 1 atom. Oxygen is then said to have a valence of 2, as it requires 2 atoms of H. to balance 1 of O. By the use of this method all chemical symbols and formulae may be expressed and written.

SO FAR as known to "Concentrates," all attempts made to treat auriferous tailings from chlorination plants by cyanide process or by any other wet process, has thus far met with only moderate success, and in no case has a financial success been made. Such tailings consist largely of iron oxide and, if briquetted, would make suitable material for smelting, but these tailings are usually not located where they can be sent to a smelter and treated at a profit. A great deal of experimenting has been done on this class of material and many thousands of dollars spent in the effort to find a satisfactory solution of the problem of their treatment.

WIRE ROPES must not be coiled and uncoiled like hemp rope. When uncoiling a new rope not wound on a reel it should be rolled like a wheel along the ground, one end being first made fast. This will obviate the kinking of the rope. The same precaution should be observed when coiling up an old rope, if it is intended to use it again. Old hoisting ropes are often valuable for guys, power transmission and other uses. Wire rope which is to be placed under water or in a wet place should be treated with a compound made of one bushel of fresh slacked lime to one barrel of mineral or pine tar. Boil and apply hot.

By abandonment of a claim is meant intentional desertion of it. Forfeiture operates from failure to comply with the law. If a claim is abandoned by a locator, it is supposed to be immediately open to relocation, but to insure against future legal complications, in the event of the claim becoming valuable, it would be wise to get a bill of sale from the original locator, or wait until his right expires under the forfeiture law. Otherwise, in the event of the newcomer making valuable developments, the original proprietor may undertake to reassert his rights and be able to "prove" that he had no intention of abandoning the claim, and that it was not subject to relocation.

FOR convenience in the determination of minerals a scale of fusibility has been arranged as follows: 1. Stibnite (antimony sulphide), fusible in candle flame in coarse splinters. 2. Natrolite (a sodium aluminum silicate), fusible in a candle flame in fine splinters; easily fused before the blowpipe in coarse fragments. 3. Almandite (iron alumina garnet), infusible in candle flame, but fusible before the blowpipe in coarse fragments. 4. Actinolite (variety of amphibole), less fusible than almandite; fusible before the blowpipe in coarse splinters. 5. Orthoclase (potash feldspar), fusible before blowpipe in fine splinters. 6. Bronzite (rhombic pyroxene), only rounded on the edges in very fine splinters.

WHEN a diamond drill hole is started horizontally it invariably drifts upward, though its alignment may be straight. The amount of departure from a horizontal line varies with the character of the rock somewhat, and also to some extent with its dip. A hole started horizontally, at a distance of 440 feet from the point of beginning had drifted upward 16 feet, and at 540 feet was 24 feet above the datum line. The line of drift of the cutting bit moves in curve, having a constantly changing radius. These radii are of constantly decreasing length as the hole progresses, though what it would ultimately become if it were not for the binding of the pipe line in the drill hole has never been determined.

WHEN gold bearing zinc precipitates are to be smelted the following are said by an authority to make satisfactory charges: For clean precipitates (auro-cyanides): Precipitate 15 parts; bi-carbonate soda 7.5 parts; borax (fused) 4 parts; sand 2.5 parts. For precipitates containing much zinc: Precipitate 15 parts; bi-carbonate soda 7.5 parts; borax 6 parts; sand 2.5 parts. For sandy precipitates: Precipitate 15 parts; bi-carbonate soda 10 parts; borax 5 parts; fluor spar 1 part. The melting is done in black lead crucibles. Furnaces in which large charges of zinc precipitates are melted should have specially constructed flues leading to condensing chambers, as the volatile metals carry off considerable gold during the melting process.

IT is said to be the intention of the Government to convert the Grand canyon of the Colorado river in Arizona and the surrounding territory into a national park to prevent vandalism and to prohibit any person or corporation from assuming exclusive rights and privileges. There are some mineral deposits in the canyon in the

neighborhood of Cataract canyon, but it is doubtful if they are sufficiently valuable to be operated under the existing conditions, as they are nearly 5000 feet below the rim of the canyon and only accessible by narrow, steep and tortuous trails. Power might be derived from the river, but the cost of installation is almost prohibitive and not justified by the extent and value of the mineral deposits.

IT has never been satisfactorily explained why, when an explosion of nitroglycerine or powder occurs at the plants where they are manufactured, and the explosive is scattered about in several warehouses, tanks, etc., in the various stages of its manufacture, and these repositories often separated by several hundred feet, the entire amount is not at once exploded as a result of the shock, but repeated experience has shown at several powder works that when the initial explosion occurs, whether in the mixing house, in a warehouse, or elsewhere, there is usually a series of explosions, separated by an interval of several seconds, sometimes of sufficient duration to allow workmen to escape injury by running immediately after the first explosion.

A "WIND SAIL" for mine ventilation will be of little value unless made of a liberal size. Less than 40 square feet of surface seldom accomplishes the desired results, and, unless the velocity of the wind be more than 15 miles per hour, a larger sail is recommended. The pipe leading into the mine should not be less than 6 inches in diameter. The pipe may be made of drilling, held open by rings sewed either on the outside or inside of the pipe. Where continuous or daily winds can not be depended upon, a furnace may be connected with the ventilating pipe and the air drawn from the surface by this means. These ventilating furnaces are useful in proportion to their size and the completeness of the pipe system. This device operates by drawing the foul air from the mine. The water-blast is often employed to advantage in ventilation. Its operation is the reverse of the furnace, as the fresh air is driven into the mine, diluting and forcing the foul air out.

IN gold milling practice too much water may be used, as well as too little. In either case the best results cannot be obtained on the amalgamating plates. If too little water, the pulp will not be readily discharged from the battery, and on the plates the particles will not be as free to sink to the amalgamating surface. If too much water, the tendency is to scour the plates. On concentrators of the Frue type a lack of water is more easily remedied than a surplus, as clear water is always added at the head of the machine—a surplus of water will carry values over the foot of the machine. Where a surplus of water is necessary in the battery, owing to the character of the ore, and the amount floods the concentrators, a portion of the water may be cut out by passing the pulp from the plates into hydraulic separators (pointed boxes), running the overflow either to special machines or to a canvas plant, and the coarser material from the bottom may then go direct to the concentrator.

PLACER gold is rarely pure, nearly always occurring as an alloy. Its value per ounce is influenced by the character of the gold in the vein or deposit from which it was derived. Some Montana gold is worth but \$12 to \$14 per ounce. In other districts it is higher grade. The Black Hills, S. Dak., placer gold seldom is worth less than \$18.50 per ounce, and sometimes more. The placer gold found at Virginia City was worth but \$11 to \$12 per ounce, the gold being alloyed with silver. The further the gold is found from its source the higher grade it usually is, and when gold has been redeposited several times it seems to go through a sort of refining process. The bullion of the Homestake veins at Lead, S. D., is worth about \$17 per ounce. The placer gold in the ancient shore gravels at the base of the Cambrian, near Lead and Central City, is worth about \$18 per ounce, and that in the recent gulches which derived their gold from the conglomerate is worth about \$18.50 per ounce. The placer gold in the Juarez district in the northern part of Lower California is almost pure, and sells for \$20 per ounce.

VISIBLE GOLD often is found with pyrite, more commonly with arsenical pyrite, and sometimes with galena, zincblende and copper pyrites. Gold has also been observed with native copper, in sulphur, in marble, in garnet, in hornblende, in mica, in feldspar, in baryta, in jasper or flint, in black oxide of manganese, in sandstone, in various lavas (andesites, etc.) where occurring in veins and deposits. In Colusa county, Cal., were discovered a number of pieces of siliceous rock, apparently sinter, the outer portion of which was sprinkled with gold. (A specimen of this rock may be seen at the museum of the California State Mining Bureau in San Francisco.) Gold also occurs in visible grains in dikes of diorite, felsite, quartz-porphry, granite, and in many other rocks, both intrusive and metamorphic. It is also associated with cinnabar, but more commonly with iron and silica than with any other minerals. In view of the wide distribution of gold and its many associations, prospectors should carefully investigate every reef and outcrop, regardless of theory or previous experience. Those who go prospecting in search of a vein of definite size, appearance and character are more likely to be disappointed than they who have no prejudice, and this is one reason why "tenderfeet" have found some of the most noted mines.

## The Fairview Mine, Trinity County, Cal.

Written for the MINING AND SCIENTIFIC PRESS by  
SAMUEL C. WIEL.

The last report of the State Mineralogist (1896) gives a list of about eighty quartz mines and just 100 stamps dropping in Trinity county. Two years later, in 1898, the State Mineralogist's Register showed 160 quartz mines. This great increase has not ceased in Trinity county, and the Fairview, near Minersville, is an example of it and of the rapidity with which mines are opened in this State.

The Fairview was taken up by the present company and the work of opening it up was begun only three years ago. This property was first examined by Joseph H. Porter, then in charge of the Altoona quicksilver mines at Cinnabar. It is located on the Trinity river, almost  $1\frac{1}{2}$  mile below Minersville. There the river is about 250 feet wide and runs in a broad canyon whose sides, heavily wooded, rise 1000 feet on the east and west. The situation is typical of California scenery, as shown in the engraving, page 17. There is the snow-tipped Salmon range in the distance, the heavy forests, the rapid streams emptying from the gulches into the Trinity river, and the river itself winding away in the distance. The muddy water of the river evidences extensive placer mining above.

The vein has large outcrops on the east side of the canyon, about 600 feet up. From the river banks to these outcrops there is a steady showing of gold in the pan, and in this way the ledge is traceable also beyond the outcrops for a great distance. When the company took hold of the property the only developments consisted of two prospect shafts, about 50 feet deep, and an inclined winze, about 100 feet long, all sunk where the vein cropped out on the surface. The company proceeded to drive a tunnel 100 feet below these workings. Ore was reached within 25 feet, and was followed continuously as far as the tunnel went, now in 370 feet, with the breast in good ore, and in a vein 30 feet wide. Below No. 1, about 83 feet, was run another tunnel 700 feet long, showing the ore shoot about 600 feet in length. Raises between the two proved that this was the same vein and shoot, and some stoping that has since been done shows the width of the vein as exposed at the end of No. 1 to continue downward, in some places reaching 50 feet in thickness.

On this showing a 10-stamp mill was erected in 1902, there being enough ore in sight to run it for several years, and to date nearly \$80,000 have been recovered from the ten stamps, but new developments have indicated the need of more stamps. These new developments consist in a third level, about 130 feet below the second, which is now in 1000 feet, with ore for the last 600 feet. At its end the richest ore in the mine has been struck. Raises and winzes between Nos. 2 and 3 prove the third level to be on the same shoot as the second. Below the third it is expected in the future to drive at least two more levels, the fourth having been already started. To handle the ore now in sight between the third and the surface, twenty stamps are being added to the mill, making thirty in all.

The conditions are favorable for working a low-grade proposition. The ore is taken out entirely in tunnels, without the need of hoisting any place in the mine. Drainage through the tunnels carries off all the water, making pumping or the use of skips unnecessary. Covering the hills is a forest of timber that furnishes caps and posts 20 inches in diameter, the largest put in the mine. Larger timbers are readily obtained among the rest, when desired, being floated down the Trinity river to the sawmill (see illustration, page 17), with little expense. In getting the ore to the mill it is sent in chutes down to the third level, and from there in cars along the hillside to a self-acting tramway, which lowers it on a brake to the mill, near the river (see engraving, page 17). The only cost in delivering ore to the mill is for the man who pushes the car and the man who tends the tram.

Water power under a head of 200 feet from Papoose creek runs the mill, and additional water is now being brought in a ditch about 3 miles long from Stuart's fork to run the additional stamps. Stuart's fork is on the west side of the Trinity river, whereas the mill is on the east bank. To cross the river it was first intended to drop the water on the opposite bank and deliver the power to the mill by cable. The complications of machines and the length of cable necessary caused this idea to be given up, and arrangements have been made to cross the river with a pipe line 800 feet long to the same bank with the mill. Probably the wheel will be connected with the line shaft of the mill by belting and not directly connected thereto, in order to have the wheel at the lowest point possible, in which case the drop will be about 85 feet. Two Hendy wheels will be installed, under the direction of Mr. Firth of the Joshua Hendy Iron Works.

With this increased power the mine will have a thorough equipment. A dynamo will furnish current with about 3000 feet of wiring for electric lights. Lamps, and to a great extent candles, will be done away with and incandescent lights substituted under-

ground. The mill and the whole camp will be lighted. A set of electric moter cars will replace the ordinary hand cars, bringing the cost of delivering ore to the mill, it is estimated, one-half lower than at present. An air compressor will likewise be installed, and it is expected that there will be power enough to add an electrical equipment for a timber-framing machine.

In treating the ore the Fairview is likely to suggest some addition to the present methods of treating gold ores. The ore is soft and requires little crushing, between three and four tons per stamp a day being the duty of the mill, but the tailings formerly carried off \$1.50 per ton of the values. It was found that this was due to the presence of manganese in the ore, coating the gold and preventing amalgamation. The plates were increased, so that now the area of the plates is unusually large. Caustic soda was added before crushing, partly to brighten the mercury and partly to react upon the manganese. With this treatment the tailings have been brought down below \$1. Cyaniding the tailings has been tried, but so far has not been encouraging, and it is expected that some new method will be found to bring the tailings lower still.

The camp is a nucleus about which a future town is not unlikely to develop. The company runs its own store. A stage line will shortly connect Fairview directly with French Gulch, and through that, with Redding, on the railway. This, with the telephonic connections with Lewiston, will bring this part of Trinity county into close connection with the rest of the State. The Fairview is only one example of the new activity in Siskiyou and Trinity counties.

### Ditch Construction.

An important factor in mining is ditch construction. In every mining region where water is available the ditch system is more or less elaborate, but in no mining State are ditches longer, larger or more numerous than in California. In some districts four or five ditches may be seen along the mountain side, one above another, extending for miles. In the early history of mining in that State one of the first essentials to successful placer mining on an extensive scale was the construction of ditches. As the property of some of the companies was very extensive and valuable, justifying large expense in construction, the business of ditch making became to be a science. In California ditches are built wherever they may be required with little regard to the character of the country through which the ditch must

to cut and float the lumber down the ditch and flume to the point of construction. This makes the building of the flumes much less expensive than they would otherwise be. It is customary to clear the ditch line of brush and trees before beginning the excavation of the ditch. The accompanying engraving shows the early stage of work in the construction of a large ditch in Trinity county, California. In a mountainous region it has been found that narrow ditches with steep grades are preferable to broad ditches having less grades. The cost of the former is considerably less, and also the cost of repairs. Through the rocky strata the ditches having steep grades do not, as might be expected, cut their banks to any great extent. Large ditches having grades up to 20 feet per mile and carrying 3000 miner's inches are in successful operation. In the valleys where the soil is soft and more ashy such grades are not usually permissible.

It is the custom to excavate the inner slope—next the hillside—at an angle of 60° and that on the lower or outer side at 65°. Loose rocks and debris will not rest at these angles, and when the work of excavation is in progress the engineer in charge must suit the degree of slope to the character of material through which the ditch passes. A ditch having a width of 4 feet on the bottom, 3.5 feet deep, and 8 feet wide on the top, and having a grade of 19 feet per mile, will carry about 2500 miner's inches of water.

Often in the construction of a ditch a substantial retaining wall is necessary on the lower side. Generally speaking it is bad practice to grade out a hillside for the purpose of laying a flume upon the ground. Winter rains are likely to do much damage to a flume so constructed, unless the flume be covered with earth, which in time will cause the lumber forming the upper portion of the flume to rot. In some districts and under certain circumstances flumes are preferred to ditches, as in the case of very hard rock which would render excavation expensive, or in loose rock where much water would be lost by absorption. In some instances steel pipe lines have been considered more satisfactory than either ditch or flume, but these instances are comparatively rare. They may be justified where the amount of water available is limited and little or no leakage or evaporation is permissible.

### Iron Mines in Utah.

At last a large slice of the rich iron land in Iron county, Utah, has passed into the hands of outsiders, the deal having been closed recently when the entire \$90,000 required to effect the transfer of the ownership of the property was paid over to the vendors, says the American Manufacturer. The Colorado Fuel & Iron Co. and the Taylor estate were the parties to the transaction, the former being the purchaser. The consideration seems small, especially when compared with the figure the owners have heretofore asked for the property. The option obtained about a year ago by the Kimberly-Buhl-Jones syndicate called for the payment of \$250,000, and \$50,000 was paid for the privilege of the option. The Colorado Fuel & Iron Co. was already a large owner of Iron county land, and this last acquisition gives it control of more than half of the best property in the district. However, there is no cause for congratulation on this account. Everyone in Utah has hoped for years that some company would take hold of these valuable deposits and build iron works there, thus opening up a new industry in the State. A second Pittsburg could be founded in Iron county if the right parties became interested there. But there is no hope that the Colorado Fuel & Iron Co. will do this. It owns one of the large-

The Preliminary in Ditch Building.

est plants in the country at Pueblo, and it is not likely that it will erect another in southern Utah. It will probably have a railroad run to its mines and ship the ore to its Colorado works whenever it requires more than its other properties can supply. This may be in the immediate future and it may not be for years. It is more than likely that the purchasing company acted as much in self-defense as anything else in buying these properties. It saw the probability of a dangerous rival springing up in Utah and it took the necessary steps to prevent it. It was a brilliant move on its part, but it is not likely to be very beneficial to the State.

pass. If there are obstacles in the way, such as rocky, precipitous bluffs, deep canyons, and heavy timber, means and methods of surmounting these difficulties must be found by the engineer, as the water must be delivered at a certain point in order to secure the necessary head for hydraulic operations or for power. Such being the case, the business of ditch construction, including flume building and the laying of pipe lines, has developed some interesting features. The first thing to be done in contemplating a ditch line is a preliminary survey. This is done usually by means of aneroid barometers and hand levels. These give approximate data, and in a ditch 30 or 40 miles long this may require several different routes to be surveyed before location is undertaken. The survey must contemplate the crossing of canyons, the tunneling of ridges, the passage of rocky slides, loose steep hillsides, and many other drawbacks to an easy and inexpensive construction. When the line has finally been located and the grade and size of ditch and flume determined the work of construction begins. It is not uncommon to begin at the upper end, and where large amounts of lumber are to be consumed in flume building to locate a saw mill at some convenient point along the ditch line in a suitable body of timber, and

GREENSTONE is a general term for several basic rocks—diabase, diorite, etc.—and is employed in field geology to indicate in a general way the character of such rocks, it often being impossible to distinguish between diorite and diabase in the field. All diorites and diabases are not green. Some diorites are light gray in color and some are black, except usually in thin section, when they appear green. The green color of greenstone is due to the discoloration of the feldspars by chloritic mineral, resulting from the decomposition of the hornblende of the diorite or the augite of the diabase, which first alters to uraltite.

### The Measurement of Ore in Dumps.

It is often necessary to estimate the amount of ore or rock contained in a dump or a series of them on a mine, and it is a process usually requiring care, and more or less calculation. The amount can only be determined approximately at best, still it is close enough for most purposes if the measurements and calculations be carefully made. The measurement of earth in railroad and similar embankments is readily arrived at by the employment of prismoidal formulae, as these embankments are usually more or less regular as to form and size, but with mine dumps it is more difficult to make the measurements, owing to uneven surface of the ground—usually a hillside, often with slopes in two or more directions. If there be a level space at the top it will probably not conform with the outline of the dump at the base. There

on the surface on each point measured. These forms may also be measured by prismoidal formula.

The method of approximating the contents of an average dump is by taking the measurement of the side of one of the blocks A to B (Fig. 1) and multiplying by the vertical height of the block "D to E" (Fig. 2), and dividing by 2. This will give the area of the triangle A B E. Multiply this by the length of the block along the dump C to A, which will give approximately the cubic contents of the block in cubic feet, which, divided by 20, will give the tonnage of the block.

The several blocks must be figured separately and the results added to ascertain the total amount. As a matter of course, the operation can result at best in giving only approximate results, owing to the irregular form of most dumps, still it will afford results which will be near enough for most practical purposes. The measurements are all readily made with the exception of that giving the vertical height D E.

graphitic quartz schist, crystalline blue limestone and streaks of greenstone. The schists on the divides between Anvil and Glacier and Glacier and Rock creeks are in many places cut through with wide and strong belts of quartz stringers and gash veins, extending west of Rock creek to Snake river. Fissure veins are not yet satisfactorily proved to exist. The minerals so far found in development work done at different places on these belts are principally sulphide of antimony, petzite, arsenopyrites, pyrite, galena and visible gold. Scheelite, a heavy, soft, brownish-white mineral with glassy luster, is a common thing in the sluice boxes, especially in Glacier creek, but has not yet been found in other places.

As these belts form the bedrock and contain the same material as the gravels of the richest placer ground worked, it is at least suggestive that systematic quartz mining should be highly remunerative. The presence of petzite (silver-gold telluride), discovered by the writer, is considered a very important

Typical Appearance of Dumps, at Cripple Creek, Colo.

are many irregularities of shape difficult to describe, but with which the mining man is familiar. The accompanying engraving illustrates the appearance of the average mine dump in mountainous regions.

In order to estimate the cubic contents of the dump careful measurements must be made to ascertain the length, width and height of each separate dump, and to do this it is best to divide the dump into blocks or sections. Generally the back portion,

This may be ascertained by sighting with any leveling instrument (a common spirit level will do) from the level or top of the dump at B to an upright staff or pole held at E. The distance on the staff at D may then be read from the foot marks on it. If the dump is too high for the measuring pole, the measurements may be made in a series of steps. If the outline of the dumps be very irregular, like those in the accompanying engraving, the result of the operation will be more accurate, as the cross-sections measured are more numerous.

### Possibilities of Quartz Mining in Nome District, Alaska.

Written for the MINING AND SCIENTIFIC PRESS by F. LUNDSTROM.

The most important rocks of the Nome district in Alaska have been shown to be mica schists, graphitic quartz schists, crystalline blue limestone and streaks of greenstone. The distribution of gold throughout the district has been great, and it is impossible to estimate the amount remaining for human enterprise to recover. The principal creeks worked are Anvil, Glacier, Rock and Dexter, with the gulches leading into them.

In all these creeks, it has, without exception, been proved that the so-called pay streaks never go in the direction of the creek beds, or in any methodical way, and thus indicating, even to the most experienced old hand, where to look for rich pay. The nuggets found are never rounded or flattened like those in the Yukon district. One found on the Pioneer Mining Co.'s ground last season, on a so-called bench claim, contained of 182 ounces gross weight, 43 ounces of quartz, and did not show any sign of attrition to speak of, such as is characteristic of placer gold. The pay streaks are not confined to the lower parts of the creeks. High above the channels are situated the bench claims, which have been shown to contain just as valuable gold-bearing gravel, and on account of the depth, in many places over 100 feet, of great importance. This is evidence that the gold in the pay streaks in the gravel beds of the channels has not migrated many miles.

As mentioned before, the hills between which the rich placer beds are situated consist of mica schists,

factor in showing that quartz mining ought to be successful in Nome district. Petzite contains tellurium, silver and gold, its color is blackish, its fracture conchoidal and it is sometimes tarnished. It seems in Nome to be richer in gold than in silver. As an associated metal, here is always found native gold. That native gold still exists in the mineralized belts of rock in situ, cannot be doubted. A heavy, often very rich, black sand is found in the sluice boxes with the gold, and mercury has to be used for the saving of the gold. In the opinion of the writer, this black sand had its origin in the rocks producing petzite, and it also is rich in gold.

The only thing needed for success in quartz mining in Nome district is skillful and experienced management, and no geological prejudice in regard to the formation on account of its being soft and "nothing in place," the surface rocks being much fractured and disturbed. The bedrock in Anvil and Glacier creeks is chloritic and mica schist, showing principally the same formation 600 to 800 feet below the hill tops. The United States Geological Survey estimates the Nome series to have a thickness of from 5000 to 6000 feet.

Assays of ores show very different results. Quartz with red oxide of iron shows often visible gold, the other part being practically barren. Petzite is, so far, found in a kind of conglomerate or brecciated schist and arsenopyrite when it is very rich, and assays from \$60 to \$300 per ton. Quantities of this mineral of some importance have been shown in prospecting tunnels on the west side of Glacier creek. Stringers of the conglomerate are mixed with what is called ribbon quartz, which is white quartz like ribbons in a layer of schist. The writer has found float of ore containing petzite. The minerals in the float were arsenopyrites, blue limestone and mica schist, besides the petzite. It assayed \$65 per ton, and when panned showed extremely fine free gold. The locality of the find was on the slope of Mount Brynteson, where the Pioneer Mining Co. owns a large quartz mine, discovered and staked last year.

The economic conditions at Nome should not deter anyone. In quartz mining, where work could be carried on the year around, the miners would be satisfied with wages very little higher than paid elsewhere. Timber can easily be floated from the mouth

Fig. 1.—Plan of Dump

Fig. 2.—Section of Dump.

that adjacent to the slope of the hill at the top, is straight or sufficiently so for the purpose for some distance. The front or slope of the dump usually presents an angle with the horizontal approximating 35°. It will also be necessary to ascertain as closely as possible the slope angle of the hillside covered by the dump, and to measure the vertical height from the base of the dump at the front, as well as its width

of the Yukon or St. Michael. It is only a question of time when the landing facilities of Nome will be satisfactorily arranged.

Reference has been made herein to the immediate vicinity of Nome, but I hope to have in some degree shown the possibilities of that particular part, leaving to the reader to draw conclusions of what is to be found in the great area of known gold-bearing ground still as good as virgin throughout this particular district.

## The Young Quartz Miner.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by  
MATT. W. ALDERSON.

### PART II.—USING THE TOOLS AND DOING ONE'S WORK TO ADVANTAGE.

The first thing needed by the young man who seeks to become a quartz miner is a recognition of the importance of the work and confidence in its future. Whatever may be said against the love of money, there has been no civilization without it. The North American Indian, living for centuries in a country rich in agricultural, pastoral and mineral resources, promises to become extinct, leaving behind him almost no evidence of his existence except in the records of another race, eager to appropriate that for which the Indian did not care till he had lost it. So far as we are able to trace, civilization had its beginning on the banks of the Euphrates and the Nile. And the evidences we have of the life of the people of those early days are due to the appreciation and use of mineral wealth. They built cities, temples and pyramids that time has been unable wholly to efface. They had money not only to erect structures unparalleled in the history of man, but to inlay their chariots with gold, and in some instances to put bridle-bits made of precious metal in the mouths of their horses.

Almost at the very beginning of sacred history we are told that "Abram was very rich in cattle, in silver and in gold," (Gen. xiii:2), and that at a time of famine he went into Egypt, where, presumably, he used some of his wealth to secure the necessities of life.

In time the great Chaldean, Babylonian and Egyptian powers suffered a decline, which can be traced largely to a decline in the production of the precious metals.

Coming down to our own times, we see the most rapid development of the country where there has been due appreciation and utilization of its mineral resources. It would seem that no one can fail to recognize the importance of the industry; but how about its permanence? It is part of the history of peoples that mines left as worked out at one age of the world have been reopened with profit at later times. The copper mines of Pharaoh, at Mt. Sinai, worked before the time of Moses, after having remained idle for thousands of years are producing today. In Korea, where it is believed by some Solomon secured a large part of the many millions that were put into his temple at Jerusalem, one company now employs 5000 men in mines left as worked out thousands of years ago, and the production now exceeds two and a half millions a year. Throughout the West are hundreds of properties which have been mined to depths of less than 100 feet and abandoned as worked out. The young man who believes that there is no promising future to these properties; that mining is a lottery; that the future of the industry will never equal its past, should continue to drive a delivery wagon for a grocery store or go to work on some farm. People will, beyond question, need groceries and breadstuffs while he may live.

Having faith in the future of the industry, the young quartz miner will feel justified in taking time to do his work well. In sinking a shaft, or driving a tunnel, realizing that the opening may be used for hundreds of years, he will do his work so it will be permanent and not makeshift in character. One of the most annoying features in giving employment to unskilled men in a mine is caused by their impatience. A man is put on as a mucker, and in a few weeks, before he has learned to do this branch of the work to advantage, before he has even learned to swing a pick so it will do good execution, he thinks he should be put to mining at full wages.

The first work that will be given the novice in a quartz mine will be with pick and shovel. He will think any one knows how to use these tools, and, so long as he thinks thus, he will fall far short of doing full duty. He will need to learn to use these tools with either hand forward; for this will be to his advantage, not only in mucking, but especially when working in narrow stopes. Many use a pick with the hand near the pick-eye rigid. This hand, on the contrary, should be free and should grasp the pick handle lightly, coming back towards the end of the handle as the pick descends. Otherwise the blow of the pick will lack in force and the hand receive a jar. The pick is a wedge with a handle to serve to drive the wedge in and act as a lever, and it is used for loosening closely compacted ground, or rock partly broken up. One must not use it as a crowbar, thus running

the danger of breaking it, nor as a sledge for pounding solid rock.

When the young quartz miner drills his first holes he is apt to be surprised that they do not go in straight, and that he can not get the hole in very far because the drill binds. This comes from the drill not being held straight and having the usual "wabby" motion of a person attempting movements to which he is not accustomed. When one gets so he can make the sides of his hole straight, he will be surprised that they will persist in curving upward, describing part of a large circle. This is caused by the pulp, as made, falling to the lower side of the hole and forcing the point of the drill upwards. It is overcome by holding the drill slightly over the center of the hole as it is being struck. The drill is held in one hand and struck with the hammer by the other. It is then moved slightly, so that the edge of the drill will cut new ground close to the previous cut. In practice the driller learns to turn his drill about one-sixth or one-eighth of its circumference with each blow of the hammer. Occasionally one sees a miner who gives his drill a quarter turn. This is too much for most rock. Observation will show that this man will not do so good work, the tendency being to break the rock in coarser particles than it is advisable to make, as they interfere with the turning and steady progress of the drill. One should learn to give a full, square blow at each strike. He may know if he is doing this by the appearance of the head of his drill. If he strikes other than a fair blow, the face of the steel which he has struck will show an indentation, such as one would make if he sought to broaden the head for a rivet. There is a vast difference in the movements of different men when striking. One grasps the handle of his hammer about half way between the head and the end of the handle and rains sharp blows in quick succession on his drill. A better way is to grasp the handle near its end and give a powerful blow. Only occasionally is the ground of such a character that a man must hit the drill lightly. The learner should not be in a great hurry, but take time to go through the motions without strain. In time one will get a motion that will be easy and powerful. Then he will need to keep under steady motion. The best workman is one with a kind of plow-horse gait—a steady, even, continuous movement to the end of the furrow.

There are three kinds of holes it will be necessary to learn to drive—a "down hole," a "back hole" and an "upper." It will be comparatively easy to learn to drive the first two, for one uses the regular stroke he would make in driving anything with a hammer. In driving an "upper," however, one must use a different swing of the arm, and the strike is so awkward to a man till he becomes accustomed to it—that is, he is apt to put off learning it altogether, if possible. It is true that in many places a back hole may be so placed as to do, instead of an upper; yet the fact remains that an "upper" is one of the most advantageous holes that can be driven for two reasons: 1. It is the only hole one can drive where the pulp falls away from the end of the drill as it is made; so one has to give little attention to cleaning the hole and is therefore enabled to make better speed. 2. One does the work with less expenditure of muscular force. The hammer swings lightly from the arm, hanging down its full length, the palm of the hand forward. It is an easy, powerful movement once one gets a little accustomed to it. The young miner should learn to strike the upper, for it is often necessary to drill short upper holes for pipe supports, marks for surveying, etc.

The placing of the holes calls for the use of intelligence and discretion. Many people seem to think that the object of education is to enable one to get along without using his hands, and many laboring men seem to think it out of their province to use their brains. This is a grievous mistake. The workman should learn to use his head to save his hands. An intelligent carpenter, called upon to take a box apart, would first notice the way in which it had been put together. So in a mine, the man who does good work is the one who places his holes so as to take advantage of the lay of the ground. This must be learned by experience, but to become experienced the miner must remember the result of a former experiment.

As a general rule, it pays to put in holes of good depth—from 2 to 3 feet. Short holes are necessary often in squaring up the face, but otherwise one should plan for as deep holes as will break to advantage. A beginner naturally wishes to know how much is expected of a good man with a drill. No one can tell; it depends entirely on the kind of ground he is working in, and that may change any second. I remember working hard one half day putting in a hole 8 inches in depth. I dulled twenty-two drills in the work. A few days later, in the same crosscut, I dulled but one drill and made over 6 feet of holes in half a day.

It is poor policy to pick out soft places in which to drill. As a general rule, one should drill in the hardest rock. Breaking that, one has no difficulty with the other. One has splendid ground in which to drill where he can drill 5 or 6 inches with one drill and then have it sufficiently sharp to be used again. He is in very hard ground where he dulls twenty-five or thirty drills putting in a hole 20 inches in depth.

(TO BE CONTINUED.)

## Power Transmission.

TO THE EDITOR:—I note that under heading of "Concentrates," in your issue of May 14th, you state that "under no circumstances can an electric dynamo be placed between an engine and machinery it is desired to run without loss of power." The article goes on to recommend the drive of mill by line shafting belted directly from the engine, in preference to the installation of a motor drive.

I am rather surprised at this statement, as it is at variance with the result of my experience in plant equipment, and I am inclined to doubt the advisability of the recommendation for the following reasons:

In a plant operated by shafting and belting driven direct from the engine, the loss of power in belts and shafting is considerable. In most published tests of such equipment the loss will average at least 40% of the developed horse power, and in some cases as high as 55% to 60%. Naturally the extent of this loss is governed by the alignment and care exercised in laying out and maintaining the shafting system.

Assuming the average loss to be 40%, this shows no economy over the installation of electric power transmission, since the dynamo, line and motor losses will not be in excess of 30% in a fairly well equipped plant. This, of course, is based upon an installation of direct connected motor driven machinery throughout, which, in the present state of the art, is not practical in mill work.

Nevertheless, the comparison holds true and there is no question that the economy in transmission is very great where motors are employed in the place of long belts and main shafting, to drive short jack shafts, etc.

Again, the loss in shafting and belting is practically constant; that is, assuming that the generated horse power is 100, the loss of power in belting and shafting would be 40 H. P. This loss of 40 H. P. would remain constant under all conditions of load, the loss being still 40 H. P. whether the developed horse power at the engine is 100 or 50 H. P.

The electric losses will be a constant percentage of the developed horse power.

While it is true that electric machinery shows a slight loss in efficiency on loads less than full load, for all practical purposes it can be assumed that the 30% mentioned above will always be 30% of the developed horse power; thus, in a 100 H. P. plant operating at full load the transmission losses would be 30 H. P., while if the plant were operating at one-half load the transmission losses would be 15 H. P.

Another point in favor of the electric transmission is its convenience, which in most plants represents a practical cash asset.

The mill does not have to be laid out to follow the set lines made necessary by use of shafting and belting, but the machinery, conveyors, etc., may be arranged in a position wherein they will handle the materials involved to the best advantage. Portions of the plant can be readily shut down, and the operation of the motors may be controlled at any reasonable distance; that is, a motor operating a mine pump can be controlled from the surface just as well as at the pump itself.

There are many cases where the first cost is such an important factor that the use of electrical machinery is not advisable, but when it comes to the question of economy in the power transmission and advisability from a purely engineering standpoint, there is little question that electric power transmission shows a decided advantage over any other method.

L. P. HAMMOND,  
Manager Denver Branch Crocker-Wheeler Co.  
Denver, Colo., June 30.

The "Concentrate" above referred to appeared in the issue of May 14th, and like most other "Concentrates" was an answer to a direct question. The inquiry was from Topeka, Kans., and was as follows:

I am confronted with a power problem which I cannot solve to my satisfaction. The power required is about 100 H. P., which leaves a surplus. I have one hoist, two pumps, and a small mill of twenty-five tons capacity. The cost of fuel (good coal) is about \$14.50 per ton. Can I install electricity, direct connected dynamo to the engine, and save in the consumption of fuel?

Understanding the question to contemplate placing a dynamo between the engine and the machinery to be operated, "Concentrates" replied as follows:

Under no circumstances can an electric dynamo be placed between an engine and machinery it is desired to run without loss of power. If the dynamo could be run at a distance by water power, or at some point where fuel were cheaper than where the engine and mine are located, it might be more economical to install the electric plant and transmit the electricity to motors in the mine and mill, but if the power must be originated by the engine apply it direct by means of shafting and belts in the usual way. The mine pumps may be run by steam conducted into the mine by pipe (these should be carefully covered to prevent condensation as far as possible), or a Cornish pump could be put in which is actuated at the surface. A third expedient is the driving of a dynamo by the engine to supply electric power to the pumps in the mine alone, running the surface plant by steam. If this latter suggestion is not found to require too much of the 100 H. P. of the engine it may be found

more economical than any other way to handle the water. Bailing by skips may obviate the necessity of pumping if conditions are such that this method can be employed.

The reply to the above question was correct. There is practically no substantial difference between the two statements.

### The Geology of Bisbee, Arizona.

"The Geology and Ore Deposits of the Bisbee, Arizona, District," by F. L. Ransome, has been issued by the United States Geological Survey, and is one of the most interesting and valuable of this series of papers, as it deals with a district of great

### A Practical Example of the Drift of a Diamond Drill Hole.

Written for the MINING AND SCIENTIFIC PRESS by  
LOYD A. WOMBLE.

The value of the record furnished by a diamond drill divides itself into two parts—the value of the record that is furnished by the core, and the amount of dependence that can be placed upon the apparent location of any spot in the diamond drill hole. Due to the drift of bore holes of great depth, the exact location of points is hard to determine, and what have been assumed at the time of boring to have been correct have often been proven on subsequent devel-

line. The real position of the reef or banket at a depth of 751 feet, as shown in the hanging wall of the dike, which occupies the plane of a reverse fault, is the upthrown portion of the reef and is not shown beyond the intersection of the bore hole and reef. The reef, however, at this point continues on its upward course until cut out by the dike, and on its downward course for an unknown depth. The west shaft is not shown in the drawing, being west and north of the collar of the bore hole. This shaft cuts the north or normal portion of the reef at the eleventh level, having a vertical depth from collar to intersection of 1527 feet.

At the time of the sinking of the west shaft this bore hole was sunk to determine the depth which the shaft must go before intersecting the reef. From the data the supposed course of the bore hole was plotted showing the upthrown portion of the reef to be at a vertical depth of 751 feet and the normal portion at a depth of 1340 feet. When the shaft had attained the depth of 1340 feet the reef was not encountered and considerable anxiety was aroused. The shaft was, however, continued on the assumption that the bore hole had drifted, which upon subsequent data proved correct. A month ago in stopping ground on the ninth level the end of the bore hole was discovered, and from the true location of this point, and the position of the dike and faulted portion of this reef, located accurately by crosscuts run south in course of development, a section of the bore hole supposed and true has been drawn. It will be noticed from the drawing that the supposed course of bore hole gave an exaggerated thickness of dike and also of the position of the reef.

The greatest lateral displacement on drift of bore hole is 450 feet, the drift being at right angles to strike of reef and against dip. The ground drilled through was shale, sandstone and quartzite, the dike being diabase.

### Geology of the Goldfields District, Nevada.\*

NUMBER II.—CONCLUDED.

Written by J. E. SPURR.

SILVER PEAK DISTRICT.—The Silver Peak district contains abandoned silver mines and gold mines which have been considerably worked but are still regarded as promising. The silver prospects were discovered in 1864, but were shortly left idle, and in 1867 they were opened up again and worked till 1869. A 10-stamp mill was finished in 1866. A lixiviation process was used, the ores being leached with salt. They have not been worked since.

The principal properties thus far developed, both silver and gold, belong to D. C. Blair, of New York. A 30-stamp mill for working the gold ores of the Blair mine was finished at Silver Peak in 1867, and was worked for two years. The mine was then idle till the early eighties, when it was leased for two or three years. Another long period of idleness ensued, and in 1893 another lease was given for one year. Immediately after this the mine became involved in litigation, which has only very recently been settled. Mining and milling in a small and intermittent way, meanwhile, has been conducted on a number of the veins, generally of minor importance, outside of the Blair properties.

It is estimated by persons who have been familiar with the history of the mining here that the silver mines have produced a gross value of \$200,000, most of which came from the Pocatello and the Vanderbilt, while the Blair gold mine is estimated to have produced \$1,080,000.

The Drinkwater group of mines, which is the most important part of the Blair gold properties, and which has produced practically all of the \$1,000,000 worth of ore, as above stated, may be taken as typical of the gold veins which, though widespread and numerous, show a wonderful similarity of character. On the surface two adjacent veins outcrop, the Crowning Glory and the Drinkwater, the former the larger, the latter containing the greater quantity of good ore. The quality of the ore still left standing (only the richer portions having been removed for milling) has been determined to assay \$5 per ton. Considerable new development work has been done recently.

Geologically, the veins of the Blair mines are interesting. Properly speaking, they are hardly veins, but flattened lenses of quartz occurring in a definite zone 100 feet or more in thickness. The lenses wedge out and disappear both horizontally and vertically, and their place is taken by overlapping lenses. The wall rock is schist, derived chiefly from the metamorphism of an original limy shale or limestone. Frequently, also, the wall rock is a very siliceous granitic rock (alaskite) made up essentially of quartz and feldspar. This alaskite occurs in the schist in lenses similar to the quartz. There is, moreover, every transition between the alaskite and the quartz, and the schist has been, so to speak, saturated with this siliceous material, which forms seams and tiny lenses in it. The auriferous quartz lenses in the mine in many places run laterally into quartz-feldspar rock (alaskite). As a rule the values grow insignificant

\*Bull. 225 U. S. G. S.

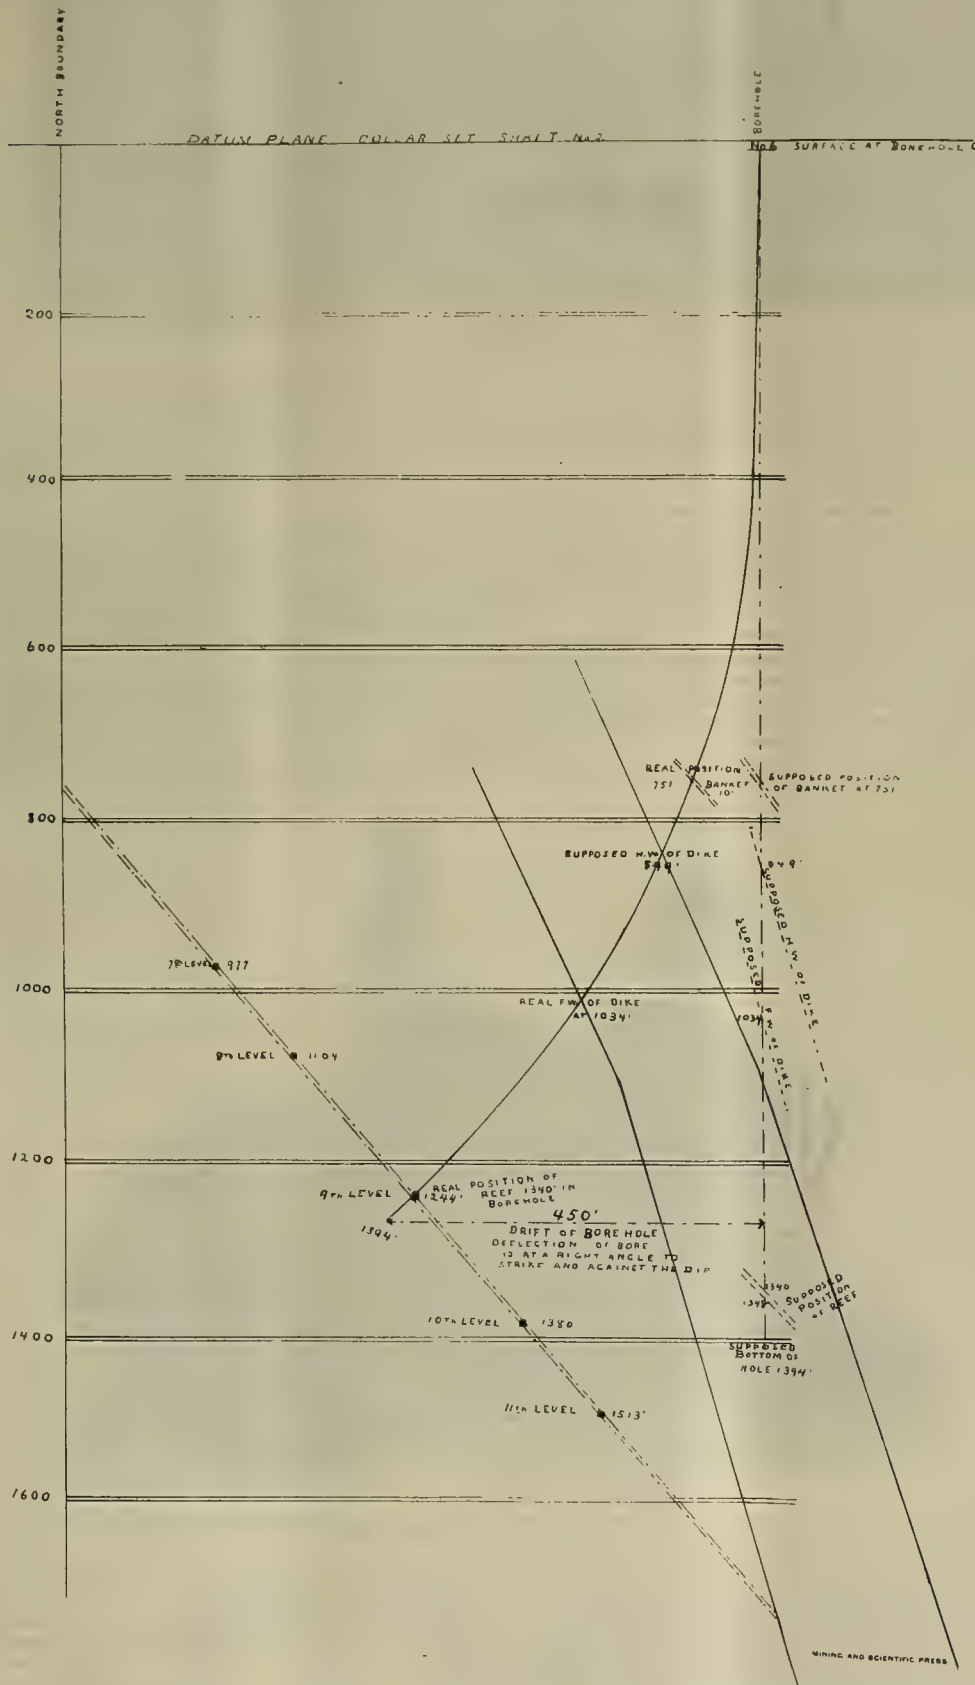

Diagram Showing Drift of Diamond Drill Hole on the Rand, South Africa.

economic importance. The volume contains many illustrations, maps and diagrams illustrative of the subject. The genesis of the somewhat erratic ore deposits is discussed at length and throws much light on this interesting class of phenomena. One of the novel features of the work is a plan map showing the irregular distribution of the known ore deposits in the Copper Queen mine, and affords much food for study by geologists and mining engineers.

opment of the property to have been erroneous. This point is well illustrated in the case of a bore hole put down at the Witwatersrand Deep, Ltd., Transvaal, South Africa.

In the drawing illustrating this article the supposed or vertical course of the bore hole is shown by the broken line, and also the apparent location of the reef and dike with their vertical depths. The true trend of the bore hole is shown by the heavy solid

with the coming in of the feldspar, but occasionally high values may still be found.

The general conclusion is that here a series of fissile shales and thin-bedded limestones has been invaded by a very siliceous granitic intrusion which has metamorphosed the sediments to schists. The quartz has plainly the same origin and nature as the alaskite, both being siliceous phases of a granitic magma.

yields stains of copper carbonate, iron oxide and silver chloride.

**WINDYPAH DISTRICT.**—This district, which has only recently been opened up, lies in the Silver Peak range, east of Piper's ranch. An abandoned mine or prospect—the Good Hope—has existed for many years a number of miles northeast of the district, in the same geological position, but the camp mentioned

large granitic intrusion just south of this place. The ore occurs as quartz replacing and penetrating limestone on the under side of an alaskite dike. The limestone near the alaskite shows contact metamorphism, becoming altered to garnet, epidote, etc.

**AURIFEROUS SAND DUNES.**—A conspicuous bunch of large sand dunes appears in the southern portion of the quadrangle in the middle of Clayton valley.

Loading Shipping Ore at the Tonopah-Belcher Mine, Lone Mountain, Esmeralda County, Nevada.

The gold in the quartz is usually free, sometimes associated with scattered galena. Diorite dikes cut the veins or follow along them, but are of later age. Along the dikes there has been water circulation, resulting sometimes in impoverishment, sometimes in relative concentration, of the original values.

This zone of veins outcrops for a mile along the mountain side. At one point, some distance below the vein zone, free gold in fresh alaskite-pegmatite country rock was found.

In the main the other gold mines or prospects of the district have exactly the same geological relations.

**LONE MOUNTAIN DISTRICT.**—The ore deposits of this region are situated within a moderate distance of two masses of intrusive granitic rock, one of which makes up Lone Mountain peak proper, while the other lies in the lower mountains to the south. The quartz veins occur in Cambrian limestone and slate. They are generally, but not always, parallel with the stratification. They follow crushed zones or selvages formed by movement in the limestones, possibly attendant upon faulting. The ore in the veins consists of small amounts of rich silver-copper sulphides, with some galena, pyrite and secondary minerals such as chrysocolla, limonite and probably chloro-bromides of silver.

The Alpine mine is near the contact of the Lone Mountain granite with a series of metamorphic marbles and some interbedded schists. In the marbles are seams of ore parallel with the stratification. Small quartz seams containing galena are low-grade silver ores. These lead into bodies of mixed galena and argentiferous lead carbonate, which widen out into irregular pockets and constitute the ore that is mined. The ore bodies follow a certain horizon around a hill, with lesser seams above and below. Diorite sheets and crosscutting dikes are frequent, but are not in any way associated with the ore.

The area of intrusive granite above noted as lying south of the Lone Mountain granite is marked by considerable contact metamorphism in the limestone and shale into which it is intrusive. On its eastern side this contact metamorphism has been accompanied by some mineral deposition. There was here noted, interstratified with schistose slates and crystalline limestones, a metamorphosed belt about 60 feet wide and traceable for a long distance. This zone is characterized by epidote, garnet, chalcopryrite, calcite, magnetite, specular iron, pyrite and galena, with certain secondary minerals—chrysocolla, limonite, and others. Some of the material gives fair assays for silver, some shows gold. Some silver ore from this zone was milled at Columbus twenty-five years ago.

**DISTRICT NEAR DYERS.**—On the west side of the Silver Peak range, near Fish Lake valley, and 1 mile east of Dyers, is a mineral district where some prospecting has been done, although at present it is deserted. In 1885 to 1887 this district was located and was the scene of a short-lived excitement, but was afterwards abandoned. Following the Tonopah discovery it was relocated, but no new work was done. One of the mines was relocated under the name of the West Tonopah. It is about 50 miles from Tonopah as the crow flies. Nearly all the ores here are bedding-plane deposits, of the same type as many of those near Lone Mountain. They occur in the Silurian limestone, within a moderate distance of a small body of intrusive granite. Along the stratification occur bunches of quartz, which are discontinuous both in horizontal and vertical extent, fading out to absolutely nothing. The quartz contains black copper-silver sulphide which, when oxidized,

was discovered in the winter of 1903 by J. G. Fesler. A great deal of prospecting has been done, but no actual mining. There is here a large body of granitic rock, intrusive into Silurian limestones, and the ores occur in both formations. The veins may be divided into three distinct classes:

1. Segregations in alaskite, which is here locally intrusive into the granitic rock. These show good gold values in segregated bunches of quartz and in the adjacent siliceous alaskite. The quartz lenses are limited in size and have not been proved to have any regular connection.

2. Quartz veins in granite: These have formed along crushed or sheared zones. The amount of quartz is variable and the walls are ill defined. The mineralogical character is like the first class of deposits. The gold values are locally good, but all workings up to the present have been near the surface.

3. Veins near the contact of granite and lime-

These have been sampled for gold and some relatively good assays have been obtained.

### Alternating Current Electric Motor Hoist.

Considerable interest has been aroused concerning the use of the alternating-current motor as applied to mine hoists. Variations in speed and load, such as occur in all hoisting work, have until recently proved to be serious obstacles to the application of an alternating current for such duty except where first converted to direct current.

The accompanying engraving shows the hoist of the Nashville mine at Nashville, El Dorado county, Cal. It is designed for a depth of 1000 feet, 6000 pounds load,  $\frac{1}{2}$ -inch rope, hoisting at 400 feet per minute. As shown in the picture, the drums are geared to a Westinghouse Type F induction motor,

Alternating Current Electric Motor Hoist.

stone: Quartz veins containing rich black sulphide, carrying copper, silver and gold. These veins are persistent, following the contact for miles, though different parts may not always be perfectly connected. Where noted, they follow the contact of alaskite dikes, which are probably border phases of the granitic inclusions. They do not have well-defined walls and are to be regarded as replacements of the limestone along the dike contacts. Frequently a dike has such a vein on both sides, though more or less intermittently.

**PALMETTO DISTRICT.**—The principal mine is the old MacNamara, located in 1880. Although assessment work has been done upon these claims, they have not produced any shipping ore. The vein is near the contact of limestone with a large intrusive body of alaskite which itself is probably a border phase of a

with variable speed, size 106, E.M.F. 2000, 72,000 alternations, three phase.

The three-phase alternating current is received at 40,000 volts and reduced to 2000 volts by three 100 K.W. transformers, whence it is carried to the motor.

The hoist was installed by the Union Iron Works of San Francisco, Cal., three months ago, and since that time has given satisfaction. The engineer states that he has perfect control over starting and stopping the load. Six speeds are obtained by means of throwing in or out the resistances, by means of a controller similar to that in use for direct-current hoists.

The 14 $\frac{1}{2}$  x 18 Ingersoll-Sergeant compressor and the twenty stamps and Frue vanners of the mill are belted to 50 H. P. induction motors. The Cornish

pumps are geared to a similar motor, and a 10 H. P. motor furnishes power for an 8x12 Blake crusher.

It is claimed that the first stamp mill in California was installed at the Nashville mine, formerly known as the Havilah. The still existing wooden stems and cast iron shoes and dies of the old mill afford a marked contrast to the present advanced equipment.

The shaft is down 875 feet on the incline. The mill is working part of the time on rock produced in development work, no extensive ore bodies being worked at present. O. R. Allen is superintendent at the mine.

## Geology of the Shafter Silver District, Texas.\*

Written by J. A. UDDEN.

The average altitude of the Shafter Mine district, in Presidio county, Texas, is about 4500 feet above sea level. The highest point on the Chinati mountains rises to 7730 feet and the elevation of the nearest point on the Rio Grande is about 2575 feet. Thus the extreme amount of relief in the district is nearly 5155 feet.

The Chinati mountains occupy an area which is elliptical in outline, with the long axis extending from northwest to southeast, a distance of about 14 miles. They continue beyond the boundaries of the district by an extension to the north of some lower peaks and ridges. The north end of the main mountain is highest and is separated from the south end by a sag in the crest caused by an eastward encroachment of the San Antonio canyon. This part of the mountain forms a dissected dome about 5 miles in diameter. The south end has the greater areal extent, being about 8 miles long and 5 miles wide. It is, strictly speaking, a terraced and dissected mesa, which rises about 2500 feet above the surrounding country. It is built up of several superimposed flows of igneous rock, and all around the mountain these form successive steps of vertical cliffs separated by intervening talus slopes. The relief of the mesa is still more diversified by incisions of canyons from all directions. On the north side these canyons are narrow and short, seldom extending more than 1 mile back from the periphery. On the south side the drainage comes down chiefly through three wide canyons, which might rather be described as irregular amphitheatres. These reach back to nearly three-fourths of the distance across the mountain.

The shaft of the Presidio mine is perfectly dry 300 feet below the bottom of Cibolo creek. This underground drainage no doubt follows some of the many joints, faults and disintegrated dikes that traverse the sedimentary rocks in the district.

**STRATIGRAPHY.**—Sedimentary rocks underlie the greater part of the entire district. The oldest of these belong to the Paleozoic group and comprise a single great sedimentary cycle. They are overlaid by sediments of the lower Cretaceous age, which again are partly covered by the land drift. The total greatest thickness of all the sediments approximates 7500 feet.

The sediments have been displaced and uplifted by deep intrusives, which lie under them, and which have caused the exposure of their tilted edges around the uplifts. On top of all this we find a series of extrusive volcanics which have concealed most of the sediments and probably also much of the deep intrusives.

**THE IGNEOUS ROCKS.**—The igneous rocks of the Shafter area cover about one-third of its entire surface. As to their mode of occurrence, they present all the three forms in which igneous rocks appear: 1. Lava flows and tuffs. 2. Dikes and intrusive sheets. 3. Laccolithic bosses.

**LACCOLITIC BOSSES.**—Laccolithic intrusions probably underlie the later lava flows in the Chinati mountains, occupying the region which is central to the crescent that marks the outcrops of the sedimentary rocks, but they are now mostly concealed by the later extrusives and by the land drift. To all appearances they were submitted to extensive erosion, and cut down to the same general level as the sediments, before the land was covered by the last great lava flows. We find them exposed now principally only in two places.

In the San Antonio canyon, and in the pass which separates the Chinati peak from the south Chinati mountains, a dark gray diorite forms the lowermost terrane. This is of a moderately coarse texture and is frequently traversed by some segregation veins measuring from 1 inch to several feet in width. These consist of a red granite rock, which is more acidic than the diabase and also somewhat more resistant to the disintegrating agencies. It frequently forms dike-like ridges on the surface of the country rock, and these ridges have an east and west trend.

To the north and east of Ojo Bonito there is an area underlain by a red, coarsely crystalline granite, possibly also of a laccolithic nature. It extends for a distance of about 3 miles from northwest to south-

east. It has a width of about a mile at the north and tapers almost to a point at its southern end. It weathers into small rounded knobs that appear like huge boulders or small hills rising above the land drift.

The Cienega mountains consist of a laccolithic dome of a highly acidic intrusive of light color, but its real relations in the field are not known to the writer.

Dikes and intrusive sheets frequently appear in the sedimentary rocks running in a variety of directions. One of these dikes is seen on a ridge about a quarter of a mile west-northwest from the Presidio Mining Co.'s mill. It is 15 feet wide and trends N. 86° E. Another, which is about 12 feet wide and bears N. 26° W., cuts the Shafter beds about 500 feet north of the town of Shafter on the north side of Cibolo creek. About a half mile to the west-northwest of the new shaft of the Presidio mill a dike 4 feet wide trends E. 18° N. In the basin of Morita creek, 3 miles south-east of Shafter, another dike cuts one of the remnants of the lava flows which have been carved into buttes in that direction. In most of these instances the rock is of a dark basic kind, which easily disintegrates and seldom appears on the surface. In the Presidio mine two of these dikes have been encountered, and even 400 feet below the surface they have been found to be thoroughly disintegrated and changed into a yellow clay. The miners call them "clay dikes."

Intrusive sheets, which follow the bedding planes of the sedimentary rocks, are hardly less frequent. One comes into view at the base of the east bluff near the junction of the Cibolo and the Sierra Alta creek, and several lie intercalated with the Carboniferous and the Cretaceous strata on the south and the south-east side of the Chinati mountains. Some of these are of a dark-gray andesite and are usually quite fresh and unaltered at the surface. Some consist of a light-gray rhyolite. One of the latter, which outcrops in an arroyo about 2 miles northwest from the shaft of the Presidio Mining Co., has a rough columnar structure.

As we approach the Chinati mountains from the east, the dikes and the intrusive sheets become more and more frequent and at the same time heavier. Occasionally they thicken into true laccolites. On the south side some of the ridges in the area of the outcrops of the Carboniferous limestone consist of heavy volcanic intrusive sheets, which lie in the same position as the stratified rocks, and next to the mountain the sedimentary rocks and the intrusives are intermingled almost promiscuously. Evidently the source of these intrusives lies in that direction.

**LAVAS AND TUFFS.**—Fully one-half of the land is yet covered by lava flows, which no doubt have extended over most, if not all, of its surface at an earlier date. They have since been carried away by erosion. We thus find them mostly absent along the principal drainage lines, as in the direction toward the Rio Grande and along Cibolo creek. But they are invariably present on all high peaks and mesas. These have been carved out usually from several superimposed flows, whose upper surfaces are apt to form stair-like terraces on their sides. The most extensive remnants of lava flows are those which form the body of the Chinati mountains and whose combined thickness approaches 4000 feet. In all probability the lavas in the hills east of Shafter are remnants of the same flows that form the Chinati mountains and which once were continuous across the Cibolo valley. In texture the lavas vary from coarse and fine porphyries to vesicular and almost glassy lavas. In the mesa known as Sierra Alta, which is about 6 miles north of Shafter, the lava sheet which forms the cap is underlain by several strata of tuffs or volcanic sand, some of a yellow and gray and some of an almost pure white color. The latter kind appears on the south-east side and shows a thickness of some 40 feet.

The vents from which these lavas came are to be found in the Chinati mountains.

**THE CHINATI UPLIFT.**—The controlling structural feature is an eastern half of the base of a great dome, whose west side lies concealed under the Rio Grande drift and whose north side extends beyond the limits of this district. The diameter of this uplift approaches 15 miles, judging from the curve of the strike of the tilted sediments. Its center lies on the north side of the south half of the Chinati mountains. The sedimentary rocks dip away from this point in all directions, with more or less regularity. The amount of the uplift equals at least the entire thickness of all the sediments exposed, which is about 7000 feet, so that if these had not been removed they would now form an elevation 7000 feet high, extending for 12 miles east and west and north and south. But the work of erosion has long ago cut down the base of this dome and reduced it to the general level of the surrounding country. This has exposed the edges of the sediments, which lie in a crescent on the east side. Within this crescent, which probably forms a continuous ring now partly concealed by igneous flows and by drift, the erosive forces have probably also cut down the central core of the igneous rocks that caused the uplift. But to what extent this central igneous mass rose above the general level of the land, as it now stands, and to what extent the mass itself may have been cut down, it is not possible to say. It may have had a considerable elevation. The diorite in the San Antonio canyon and

the granite near the Ojo Bonito is all which at present comes up to our view.

**MINERAL DEPOSITS.**—The mineral deposits in this district are limited to the older sediments and to the deep intrusives. The Cretaceous rocks and the latest extrusives have suffered comparatively little change from the mineralizing processes. They sometimes exhibit fissures filled with calcite and occasionally the igneous flows have been altered to a soft, green chloritic rock or are otherwise decomposed, but they are not known to contain any mineral deposits of importance. Such deposits occur here in five forms, viz., as lodes resembling fillings in ancient caverns, as impregnations in small fissures of irregular form, as contact deposits, as fissure veins, as fault fissures and as fissure zones.

**LODES.**—To the first one of these categories belong the ores of the Presidio mine. It lies in irregular pockets or lodes from a few feet to nearly 100 feet in length. These are connected by more narrow leads, where the ore body is often more sharply marked off from the unaltered ledges of the country rock. The body of the ore is mostly a yellow, somewhat porous rock-like mass of siliceous material in which crystals of calcite and galena are seen. In the average run, there is only about 3% of carbonate of lime and from 45% to 50% of silica. The percentage of calcareous material increases toward the wall of the ore bodies and it usually also increases with the amount of galena which is present. The bulk of the silver is in the form of a chloride dispersed through the body of the ore. But there are also pockets of galena rich in silver. This is sometimes altered to cerussite. Sphalerite, quartz and malachite are sometimes found with the other minerals. While the Presidio mine is the principal instance of this kind of ore deposits, other lodes of a similar nature have been found in the same limestone to the west. The lodes occur only in the most pure strata of the Cibolo limestone, and in the Presidio mine they reach lower and lower levels in this formation as they are followed to the east, descending more rapidly than the actual dip of the sediments.

**CHIMNEYS.**—The lodes in the Presidio mine are undoubtedly genetically related to the siliceous impregnations which frequently appear on the outcrops of the Carboniferous rocks and which are a result of the activity of the ground water at an earlier period. None of the chimneys have as yet proved to be rich enough to be profitably worked, and they probably mark some less open passage ways of the solutions which deposited the ore in the Chinati mine. Even some of these are clearly fillings in the old caverns, whose etched walls are plainly exposed in some prospect holes. Galena, calcite and hematite occur in the siliceous mass which now fills them.

**CONTACTS.**—At the contact of the granite with the Cieneguita beds, near Ojo Bonito, masses of hematite and limonite lie against the side of the intrusive, in some places near the exposure of the marble previously described. Farther north some pieces of float of crystalline magnetite were taken, and it is reported that larger bodies of this mineral lie along the same contact beyond the limits of this district. To the same class of deposits we must also refer the hematite and the magnetite masses which have been explored on the south side of the Chinati mountains at the diggings known as the Iron Works. These ore bodies are perhaps primarily the result of fusion by contact with the molten mass of the intrusives at each place, but no doubt they have later been altered and affected by solvent agencies following the zone of contact.

About 1 mile south of Spencer's spring, on the south side of the mountains, two explorations have been made on another contact of igneous intrusives. The uppermost part of one of these shows a cavern wall which is covered with a stalactitic calcareous deposit. Rusty cavern "box work," such as is seen in the Great Wind cave in the Black Hills, covers another wall. Limonite, galena and cerussite were the principal minerals in this location, and the latter occurs in a vein in the bed of an arroyo near by to the south.

**FISSURES.**—The main explorations of the Chinati mine, which is located about 2 miles west of the Presidio mine, have been made on a fissure vein bearing E. 10° N. This fissure is in the Cibolo limestone and its hade is about 37° to the north. It shows on the surface as a slight sag, running several hundred feet. About 100 feet to the south another fissure runs on a parallel course and this has also been found to contain some ore. Near the surface the upper vein, where excavated, shows several cavernous expansions, but farther down it is a well-defined fissure with stringers of galena and calcite, mostly next to the hanging wall. It has been followed for about 500 feet horizontally at three levels 100 feet apart.

In the hills of the same limestone, from 1 to 2 miles southwest of Humphrey's location, and about ½ mile west of the Iron Works mine, are three fissure veins which run north and south. These carry carbonates and silicates of copper in the form of chrysocolla, azurite and malachite. In some small excavations which have been made these veins show a thickness of only a few inches. One hade to the east and the other to the west at an angle exceeding 45° from the vertical. The limestone near the two veins which

\*Bulletin No. 8, University of Texas.

are farthest to the west has been changed to a marble.

**FAULT FISSURES.**—In the Humphrey mine 400 feet of tunneling has been done on a fault vein which follows the north side of a wedge of Cibolo limestone that has been let down several hundred feet as already described. The ore which has been brought up is limonitic and siliceous and has been found to contain lead (galena and cerussite) as well as silver. The quality of the ore is believed to warrant more extensive exploration. The ore lode has in one place been followed into a cavernous extension in the limestone block on its south side.

**FISSED ZONES.**—The Ellsworth mine in the San Antonio canyon is in what appears to be a fissured zone which cuts the diorite already described, and also the overlying lavas. Some rich pockets of native silver are reported from this claim and galena ore is also found. The trend of the fissuring is somewhat south of east.

## Mining and Metallurgical Patents.

PATENTS ISSUED JUNE 23, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

**TUMBLER FOR GOLD DREDGING MACHINES.**—No. 763,869; W. Ferris, South Milwaukee, Wis.

Tumbler for dredging machines and like, provided with non-rectangular tumbler faces, and interchangeable symmetrically formed wearing plates applied to faces, axes of symmetry of plates being bisectors of angles between two bounding edges of tumbler faces.

**MINE TRAP DOOR.**—No. 763,703; J. Wack, Canton, Ohio.

In mine trap door, frame consisting of two sections hinged together, upper section hinged at upper edge and lower section hinged to bottom of upper section, door posts having oppositely inclined faces upon their door sides, and mechanism adapted to open and close door.

**PROCESS OF EFFECTING THE SEPARATION OF MINERALS.**—No. 763,749; G. A. Goyder and E. Laugh-ton, Adelaide, South Australia, Australia.

Method of separating minerals and extracting some of them as concentrates, steps of moving ore in finely divided state in solution which by production of

gas causes certain of minerals contained in ore to rise; and deflecting and guiding them as they rise.

**ADJUSTING DEVICE FOR OIL WELL PUMPING APPARATUS.**—No. 763,621; F. P. Myers, Trailrun, O.

Device for oil well, consisting of combination of polish rod 5, grip 6 and means for attaching same to polish rod, threaded socket formed in grip, short section of tubing 8 engaging with socket, sleeve 9 attached to tube, threaded gland 12 placed in top of sleeve, gland adapted to confine section of tubing 10 therein, tube being provided with enlargement end 13 and loosely connected, jam nut 11 to prevent tube from turning, handle bar 14 attached to tube 10, threaded socket 12' and jam nut 13' operating along length of tube 10, outer tube 15 engaged with socket 12', and means 15' to attach device to walking beam, all arranged and combined for service.

**HYDRAULIC LIFT.**—No. 763,720; R. H. Campbell, San Francisco, Cal.

Hydraulic elevator, combination of series of loosely arranged aligned metal sections provided with peripheral annular grooves adjacent to their ends, packing bands in grooves and not projecting beyond surface of sections, exterior sectional wood casing for wood sections, certain of sections provided with annular peripheral flanges and tie rods extending between flanges to bind parts together.

**APPARATUS FOR USE IN CERTAIN PROCESSES OF EXTRACTING SULPHIDES FROM ORES.**—No. 763,662; G. D. Delprat, Broken Hill, New South Wales, Australia.

In ore concentrating apparatus in which concen-

trates are floated to top of body of liquid, pan having inclined imperforate bottom down which ore slides, means to feed liquid to pan, sump at lower edge of bottom for tailings, discharge for concentrates at liquid level of pan, baffle plate between sump and pan extending from discharge to near lower edge of inclined bottom to maintain quiescent body of liquid in sump and at same time maintain flow of liquid from pan through discharge.

**ORE SEPARATOR AND CONCENTRATOR.**—No. 763,444; C. Van Hoesen, New York, N. Y.

In ore concentrator and separator, combination of vessel provided in lower portion with outlet, valve closing upward with reference to outlet and provided with discharge to admit of continuous escape metal, and means holding valve seated under normal conditions, but adapted to permit valve to automatically open when metal accumulates in vessel and exerts excessive downward pressure on valve.

**WATER WHEEL GOVERNOR.**—No. 763,572; D. W. Starrett, Oakland, Cal.

Combination with water wheel having peripheral buckets, of governor comprising deflector movable in relation to discharge nozzle and adapted to impinge upon surface of impelling column, clutch mechanism carried by wheel, and actuating means in connection with deflector extending into path of clutch mechanism.

**PORTABLE APPARATUS FOR THAWING FROZEN GROUND.**—No. 763,612; C. W. Joynt, Seattle, Wash.

Thawing apparatus, comprising cylindrical fire chamber, lower portion being perforate, removable lid for fire chamber, hood cylindrical in upper portion and flaring in lower portion, hood being formed of detachable sections having draft openings in flaring walls near lower edges thereof, means to detachably secure hood sections together, and means to detachably secure cylindrical portion of hood upon upper portion of fire chamber.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

Work is progressing at the Humboldt mine, in Silverbow basin, near Juneau. The mill is dropping its ten stamps regularly.

It is reported that peat taken from a bog extending for 5 miles along Nome river will be placed on the market at Nome by the Nome Tundra Fuel Co., of which L. Walton is manager. Manager Walton owns a number of tin claims at Cape York.

## ARIZONA.

### Cochise County.

The Black Diamond mine and smelter, 7 miles from Pearce, owned principally by N. O. Baggage of Los Angeles, Cal., are running full capacity. About 150 tons of ore are being treated daily and about five tons of 60% copper matte is the daily output. From 100 to 125 men are on the payroll.

### Cocconino County.

(Special Correspondence).—The Anita C. Co. copper property at Anita, 15 miles from the Grand Canyon, has been put in shape for deep sinking by Manager T. C. Woodworth. A gallows frame, 40 feet high, has been built, a 10x14 geared double cylinder steam hoist, an 8-drill straight line air compressor, and two 50 H. P. boilers with condensers (water is scarce) have been put in. The shaft is 300 feet deep. They have started sinking it eventually to reach total depth of over 2000 feet to cut the red sandstone and marbled lime underlying the upper limestone which caps the section for 800 feet of depth. Manager Woodworth is working 30 men.

Williams, July 3.

### Maricopa County.

(Special Correspondence).—The Electra M. & S. Co., 11 miles east of Wickenburg, in Black Rock district, owned by Nickerson & Wilson, is doing work at the bottom of its 280-foot incline shaft. There are 320 feet of drifting from the shaft and some high-grade ore is on the dump. Heavier machinery is needed for further development work. The group consists of three claims, covering the vein, which is a fissure in granite.—Near the Electra is the Blue Lead with three claims on the same lead owned by G. Margaritch, who has a 200-foot tunnel and two shafts, 60 feet and 75 feet. The ore of the two properties is similar, being high grade copper, bearing gold.

Two miles northwest of the Electra on the Hassayampa river the White G. M. Co. is operating on a promising prospect. There are two parallel ledges 2½ to 8 feet wide cutting through a ridge formed by a sharp bend in the river and the entrance of Slim Jim gulch above. The ledges are 60 feet apart and tunnels on each of them are connected by crosscuts. From one tunnel a raise 116 feet has been made and a gasoline hoist will be placed above it and a shaft sunk 200 feet from the tunnel level above. When this is completed and the character of the ore determined a mill will be built. The tunnel will give backs of 600 feet. The ore is largely free milling and assays from \$4.50 to \$20. Country rock is granite. There are sixteen men at work and the owner, L. L. White, expects to increase production.—Two miles down the river is the Grijalva group, owned by Kingdon, Hirschfeld & Goldberg Bros. They have driven a 250-foot tunnel tapping the old workings, and plan increased development, but at present no work is being done.—Four miles below this (6 miles from Wickenburg) is the Oro Grande M. Co., which is starting a 20-stamp mill after two years of development work. It has 5000 feet of workings, and Manager Upton states that ore is blocked out on three sides to a depth of 300 feet. It is in an altered porphyry dike, the ore being a talcose schist and crystallized quartz with highest values carried in the red and black oxides. A 4-inch pipe line 1½ miles long has been completed with a pumping plant on the river near the lower end of the canyon.

On Slim Jim gulch, 2 miles from the Hassayampa and 15 from Wickenburg, is the Black Rock M. Co., A. D. Bellinger president and general manager. It consists of nine claims and covers two parallel fissure veins, averaging 3 feet in width and 3000 feet long. The ore is a free milling quartz and surface samples show average value of \$20 per ton. A shaft 135 feet has been sunk and at that depth iron sulphides and galena were found with a pay streak of 36 inches. In addition to the quartz veins there are on the property two mineralized porphyry dikes carrying values of free gold in oxides. They

dip toward the south while the veins dip toward them (north). Work is temporarily stopped. Machinery is on the ground for a 50-ton plant. Water for all purposes is supplied by a spring and flows to camp by gravity.—Two miles north of the Black Rock is the O'Brien or Homestake mine, recently incorporated as the Interior M. & Trust Co. The main shaft is down 320 feet, 4x8-foot manway, and has a hoist. At present depth of shaft sulphides are replacing the oxidized ores and Manager O'Brien is arranging for a reduction plant. It is expected a 40-stamp and concentrating plant will be put up. Last week the shaft house and hoist were destroyed by fire so that development work is suspended temporarily. The camp is supplied with spring water, and the Hassayampa river, 1 mile distant, will supply water for milling purposes.

Other properties in the district, now idle, are the Burson, Middleton, Keystone, Hamlin and Golden Rule. The latter is owned by a company with S. A. Hutchinson president.—Near it is the Amethyst group of eight claims owned by J. T. Cochran et al., on which 600 feet of development work has been done. Negotiations are pending for sale of the group.—East of these G. W. Morgan is developing a copper and gold group for the A. & C. M. Co. About 700 feet of tunneling has been done since December. The Whipsaw, 5 miles east of Morgan's Camp, is temporarily closed down. Between the two camps is a deposit of niter banded by Manager Foster and being banded by Los Angeles, Cal. men.

In center of Black Rock district, 12 miles from Wickenburg, is the Eagle C. G. M. Co., with five claims. Development work shows values in gold, silver and copper and the ledge at bottom of a 50-foot shaft is 15 feet wide. The company has been tied up by litigation, but they are now adjusted and Superintendent Jennings is resuming operations.—O. H. Perry is operating the Arizona G. M. Co. mine adjoining.—C. Goddard is doing development work on his claims 2 miles east of Wickenburg, with satisfactory prospects.

The Vulture property, 16 miles southeast of Wickenburg, was recently jumped by Sanders, manager of the Angel mine, who is doing location work, though the company has an injunction against anything further than that. The case will come up for trial at the fall term of court.

Wickenburg, July 2.

### Mohave County.

It is reported the Minnesota Con. M. Co., near Acme, has bought the water of the Lucky Boy mine and will convey it to their mill to increase the failing water supply at that point.—The Cedar Valley mill has started up on ores from the Queen and other mines owned by that company.

The Samoan M. Co., near Kingman, is building a railroad from the Roger Boy mine to the Samoan and Fourth of March mines. As soon as this work is finished the company will put in a hoisting plant and begin sinking to a depth of several hundred feet. Ore is being taken from the lowest tunnel level.

Manager W. A. Mensch says he is putting men to work on the Enterprise mine, in the Hualapai mountain, southeast of Kingman. A steam hoisting plant will be set up on the property and the shaft sunk to 300 feet. Levels will be opened at the 200 and 300-foot points and stopes started. It is purposed to heap-roast the ore and ship to the company's Needles, Cal., smelter at the rate of twenty tons daily. Owing to water produced by the mine, a sinking pump will be put in. By roasting the ore at the mine, where wood is plentiful, a saving can be made, says Manager Mensch.

### Pinal County.

The Batail M. Co., whose property is 2 miles from Kelvin, has disincorporated by judicial decree and all its rights, privileges and property transferred to the Gila-Pinal M. Co., which has assumed all the debts, liabilities and responsibilities of the old company, says the Florence Blade.

### Santa Cruz County.

H. Barnett of Patagonia, manager of Happy Jack M. Co., the property of which is near Patagonia, says for some time past the mines have been tied up on account of legal trouble among the stockholders, but arrangements are being made to resume. High-grade ore has been shipped to the El Paso smelter.

### Yavapai County.

At Santa Maria C. O. Carbaugh, J. H. Powers, T. W. Baker and C. Holmquist of Rockland, Ill., for the Jeannette-Arizona G. M. Co., have bought the Little Girl group of mines on the Santa Maria river, 5 miles southwest of the Golden Link Co.'s Sultan mine. There are four claims in the group. They will put men

to work this week and increase the number later.

The Oro Grande mine's pipe line north of Wickenburg has been finished and a pumping station put up on the Hassayampa river, 1½ miles from the mine. The supply of water is ample to meet all demands. The 10-stamp mill is running and thirty men are at work. The deepest shaft is down 300 feet. Test runs have been favorable and a 100-stamp mill will be put in next year, says G. B. Upton, manager.

## CALIFORNIA.

### Butte County.

At the Cherokee mine, near Oroville, owned by T. L. Vinton, a drift is being run. Three shifts of two men each are at work. The mine has plenty of water for hydraulic mining and expects to have until August 1st.

### El Dorado County.

(Special Correspondence).—The Crystal mine, near Shingle, is sinking, preparatory to increased development. The shaft is down 250 feet. Eight men are employed by S. G. Boorman, superintendent.

Shingle, July 3.

(Special Correspondence).—Ten stamps of the 20-stamp mill of the Gopher and Boulder M. Co. have been crushing ore taken from the east ledge since June 25th. J. Sipp is superintendent.

The new vertical shaft of the Lady Emma mine of the Karolyi G. M. Co. is being sunk to 200 feet, being down 100 feet. B. T. Peters is superintendent.

The shaft of the Union mine, near El Dorado, is down 1600 feet. This property has been extensively developed, all money for such development having been taken from the mine. The 20-stamp mill at the north shaft will be moved to the 20-stamp mill at the main shaft, giving a 40-stamp equipment. There are forty-five men at work. A. Harpending is superintendent and owner.

Kelsey (Slatington P. O.), July 4.

(Special Correspondence).—The 240-foot shaft of the Eureka mine, near Georgetown, is being unwatered by hoisting and pumping, preparatory to survey and sampling to be made of the underground workings. The temporary gallows-frame and hoist have been in use since June 25. Last winter a new vertical three-compartment (4 feet 4 inches by 4 feet 4 inches) shaft was sunk 181 feet. This will be continued, upon the installation of heavier machinery, to a depth of 650 feet, where it is expected it will strike the main vein, dipping 70° to the east. This work is preparatory to opening up the entire property of the El Dorado C. M. Co., including the Woodside, Eureka, Van, Modoc and Madrone mines, all of which were formerly rich in placer production. Two men are sluicing on the extension of the Eureka. W. E. Everson is superintendent.

At the Alpine mine no work is being done beyond running the pump to keep the mine dry. S. Collins is in charge.—At Georgia Slide, Flynn Bros. and G. C. Rare are working the Blue Rock mine by sluicing. The Beattie & Parson is drifting and sinking a shaft. All gravel removed in this work is washed. Four men are at work. C. Beattie has charge. Four men are at work at the Pacific, under the direction of W. Barklage.

Georgetown, July 5.

(Special Correspondence).—At the Water Lily mine, 3 miles from Georgetown, Superintendent E. Hart has finished installation of machinery for hoisting and pumping. A 40 H. P. boiler and engine run the friction hoist and a 7 H. P. equipment runs the rock breaker. A Dow pump with 6-inch suction and 5-inch discharge has also been put in to handle the water. The shaft is down 50 feet and 60 feet of tunnel have been run. Fourteen men are at work. The Water Lily is on an extension of the Clipper mine.

Georgetown, July 5.

The machinery for the Demetre mine, 2 miles above Georgetown, is on the ground.—J. M. Nougues, Jr., of San Francisco, manager of the Josephine mine at Josephine, says operations will be resumed at the mine.

W. T. Shurtleff et al. of San Francisco have bonded the Robles Grande mine near the South Fork of the American river, 3 miles below Coloma. The mine is a copper-gold proposition. Men are sinking a double-compartment shaft on the ledge. A 24 H. P. steam hoist is being set up.

### Kern County.

Los Angeles has been connected with the electrical generating and distributing plant at Kern river. From Kern river, near Bakersfield, over a transmission line 128 miles long, run three wires carrying 45,000 volts of electricity, and as soon as an additional power station is completed there, which will be by August 1st, it is said the voltage will be increased to 65,000, sufficient to generate 20,000 H. P.

The line has been completed by the Kern River Light & Power Co., H. E. Huntington manager, from the power station at Borel, on the Kern river, where the current is generated by means of turbines under pressure of water taken from the river 12 miles farther up stream. The wires are hung on the poles by 24,000 insulators, which weigh fourteen pounds each. These insulators are made of porcelain in four pieces. The power will be used by the electric railway systems in Los Angeles, Pasadena, Pomona, Riverside, San Bernardino and other places, and a number of manufacturing plants will also be supplied.

Near Randsburg a well-defined ledge is reported being developed in the Belmont and 1900 claims.—Development work on the Wells Fargo claim shows a 1-foot ledge of \$10 ore.—Development work continues on the Excelsior mine, owned by Fifeild, Barton & Tomson.—The Merced M. Co., operating in the Stringer district, have let a contract to sink an additional 80 feet in the main shaft, it being down 180 feet.

At the Butte Lode mine, near Randsburg, work is reported progressing. Returns from the June milling show from ninety tons of ore a total of \$6900 was extracted, says Superintendent McMahon.

### Los Angeles County.

Near Santa Monica the Salt Lake Oil Co., in which J. D. Wood, W. S. McCornick and J. E. Bamberger of Salt Lake City, Utah, are interested, has thirteen producing wells on its tract, each having capacity of 100 barrels and over daily. The wells are near the interurban electric line of the Los Angeles-Pacific Railroad Co., and the oil is piped to tanks on this road. The railroad company uses oil as fuel in the generation of electric power.

### Mariposa County.

At the Loughurst mine on the North fork of the Merced river, near Kinsley, J. Reynolds, owner, continues driving the lower tunnel. The vein is of decomposed quartz and free gold is showing.

### Nevada County.

J. Harrigan, T. O'Neil and four others report having struck ore in the Perrin mine, near Grass Valley. The men were working on a percentage with the company, instead of being on regular pay. In twenty-three days they took out ore netting them \$4000, as shown by the mill report, after the rock was crushed at the company's mill.

Men have been put to work at the Round Mountain Champion mine, near Nevada City. The water has been pumped out and the shaft retimbered to the bottom, says Superintendent Kartschoke.

Grass Valley reports say the Idaho-Maryland mine, which has been abandoned since 1901, will be reopened by B. Wilkinson et al. of Boston, Mass. The machinery is being overhauled in order that pumping may be started. The property is owned by S. P. Dorsey of Grass Valley.

### Placer County.

(Special Correspondence).—The Auburn G. M. & Co. is working the Buckeye mine, 5 miles from Forest Hill. The main drift is in 1300 feet and a 283-foot raise has been completed. The company is preparing to put in a Krogh roller gravel mill, a 6-foot Huntington mill and Wilkey table. As soon as these are in, Superintendent J. A. Johnston expects to open up with fifty men. The plant is expected to handle 150 tons of gravel per day.—The Mayflower is running a tunnel to tap the lower channel.

Forest Hill, July 6.

(Special Correspondence).—Work is being increased around Last Chance. The Placer Gravel G. M. Co. has bought up a number of claims, including the El Dorado and Missouri Flat channels, the Morning Star channel and the Root Hog. El Dorado channel had already been opened up and the others have been developed since the company bought them. The Morning Star channel was formerly worked following the downward course of the stream. This method had to be abandoned because of the accumulation of water. It has now been tapped from the lower end. This is the main channel of Last Chance. It is expected to take six or eight months to block it out and prepare for proper working.—The Root Hog channel has been tapped from below. It is yielding well at present, 105 ounces gold being stated as the cleanup of June 30. D. M. Ray has charge.

The Deep Canyon quartz mine, 3 miles above Last Chance, is being operated and developed by G. E. Moore of Port Huron, Mich. The property is equipped with a 5-stamp prospecting mill run by water power. Eight men are at work.—The New El Dorado quartz property comprises a number of locations owned by E. Hains, C. P. Tolotson, F. Tolotson, E. F. Kavanagh and M. Savage. They are bonded to Moore & Partridge, represent-

ing New York men. They contain four high-grade veins on the surface. A main tunnel is being run to determine whether these veins combine into one pay shoot and to find if the surface richness continues. Ten men are at work.

Three miles northwest of Last Chance, W. T. Davis and R. Caples are developing the Morning Star property. H. Parmelee and E. E. Parmelee are developing the Bishop mine, the southeast extension of the Morning Star. East of the Parmelee claim, A. J. Bishop and B. Caples are running a bedrock tunnel.

Last Chance (via Michigan Bluff), July 6.

(Special Correspondence).—Near Michigan Bluff, W. C. McGilvray is leasing and working the gravels at Horseshoe Bar.

The Hidden Treasure M. Co., operating the Hidden Treasure and Mountain Gate drift mines at Sunny South, near Michigan Bluff, started July 5 to sink a 720-foot shaft to meet the face of the drift. This is to be equipped with an electric hoist and will also be of material assistance in ventilation. A 40 H. P. electric locomotive will be used to help in hauling the cars in the tunnel, this work having formerly been done with a 20 H. P. motor. Commencing at the end of the first 4000 feet of the drift, a new 4000-foot tunnel is to be run in the cement. This will replace the sinuous drift in the swelling bedrock that has been used in the past. The drift follows the channel. Offices for the company and for H. T. Power, manager, have been put up at the new postoffice of Bullion.

Michigan Bluff, July 6.

#### San Bernardino County.

W. Osborne, who has been developing the Irish-American copper properties west of Needles, has closed camp temporarily. He will open camp again in the fall and continue development work.

#### Sierra County.

The Mexican quartz mine, near Downieville, on the South Fork, has been bonded to H. B. Tiedemann of San Francisco. The mine consists of four locations and includes the High Commission mine. Work will be started next week.

The Poor Boy gravel mine, near Downieville, owned by J. Mason et al. of Port Wine, has been bonded to T. A. Patteson, Jr., superintendent of the Pilgrim mine of American Hill. A. Fitzgerald has charge of the property and has started operations.

W. H. Squire, electrician of the Empire mine at Gold valley, near Downieville, says the company is unwatering the shaft and development work will be resumed.

#### Siskiyou County.

(Special Correspondence).—A gold find has been made in northern Siskiyou county, near the Oregon line, near Holland, Or. It was made by R. Briggs while tracking a wounded deer, on a steep hillside on the headwaters of Thompson creek. The gold-bearing ledge occurs in a contact of granite and porphyry. The values are of free gold in quartz.

H. B. Siskron is developing a quartz proposition near Holland, carrying gold values in hematite and limonite, some of which is high grade.

Holland, Or., July 5.

G. V. Gray has bought the Phillips mine, on Canal gulch (known as the Red Hill claim). It is 1½ mile from Hawkinsville. Gray has put men at work and will open up the mine. The ledge has a width of 3 feet and averages \$20 per ton, says the News. There is a shaft 120 feet deep and two open cuts.

J. Horn, owning a mine on Humbug creek, near Hawkinsville, is taking out ore preparatory to shipping to the mill. Teams are hauling ore from the mines of the Headwater G. M. & M. Co., on Humbug, to Yreka, whence it is shipped to Keswick. Manager Johnston says a body of high-grade ore has been opened.

T. A. Fisher of San Francisco, owner of the Columbia and Golden Eagle mines, in Scott River mining district, near Etna, has arranged for resuming work on the properties under J. B. Chase as superintendent. As development work proceeds the ore extracted will be run through the mill at the mine.

The Blue Lead group of copper mines in the Elliott Creek district on Siskiyou mountain, near the Oregon line, have been sold for \$175,000 to J. S. Allen et al. of New York. The group comprises twenty-seven claims, to which a railroad will be built for connection with the S. P. line in getting supplies and shipping product. J. F. Reddy of Spokane, Wash., who held the bond on the group, retains an interest.

#### Trinity County.

P. Joyce, superintendent of the Mason & Thayer mine, under bond to the Chloride-Bailey M. Co. of Carbon creek, says he is putting men to work to build a wagon road from Dedrick to the mine, a distance of 3 miles. The company is to

put up a mill in the fall. Joyce has men developing the mine.

#### Tuolumne County.

The Beehive M. Co., which has a bond on the Stinchfield gravel property on Mormon creek, near Sonora, will put in a gravel mill.

Supplies have been taken to the Hubert mine, near Groveland, and work is in progress. The shaft will be carried down to 60 feet.

The New Calico M. & M. Co., for \$6000, has taken a bond on the Calico mine, near Stent.

### COLORADO.

(Special Correspondence).—Railroad building in the mining sections of Colorado is active. The line from Silver Plume around Leavenworth mountain, in upper Clear Creek county, to the mines of that section is under way. The final surveys are being made and grading has started. This line will be the means of opening up new ground, as well as increasing output from the mines already in operation. The road will connect with the Colorado & Southern at Silver Plume.—Work is also progressing on the line from Sunset to Eldora, in Boulder county, being built by the Colorado & Northwestern Co., which operates from Boulder to Ward. The line from Central City and vicinity in Gilpin county, to connect with the Moffat line on South Boulder creek, is going ahead. This will be a feeder to the Moffat road from that section.

The trial of the men charged with blowing up the Sun & Moon transformer house, near Idaho Springs, last fall, is under way at Central City.—It is given out that the coal strike in the southern part of the State will be extended, not only to other camps in Colorado, but to districts in adjoining States, in order "to force the operators into line" to suit the miners.

Matters seem to be settling down in the Cripple Creek and Telluride districts. No more trouble is anticipated from those quarters. The citizens of Telluride are standing by their edict that the deported miners shall not be allowed to return to the district, as some of them returned and were again forced to leave. The mines in Cripple Creek are again in full operation. Denver, July 2.

(Special Correspondence).—The business and mining outlook in this State are improving. Many sections are undoubtedly better than for years past; the districts that have had labor troubles to contend with are beginning to recover. In Cripple Creek district the mines are back to their usual production and the outlook is indeed promising. Deportations still continue from this section. The coroner's jury inquiring into the deaths of R. McGee and J. Davis, the men who were killed in the riot at Victor on June 6, has declared the leaders of the Western Federation of Miners responsible for the riot. On this decision warrants were issued for a number of the leaders of the Federation. They will be brought to trial before the civil courts. The officers in charge of affairs in Cripple Creek district will find the guilty parties if possible.

In Telluride things are not improving as it was hoped they would. The Smuggler-Union mine and mill have been closed down indefinitely and it is rumored that other properties will follow the action taken by the Smuggler-Union.

Stratton's Independence at Victor has been closed on company account, and it is understood the ground will be blocked off and leased to responsible parties.

The Federal Government, through Commissioner Wright of the Labor Bureau at Washington, D. C., has detailed a man to visit Colorado and investigate the labor conditions here. The people who stand for law and order in the State will be pleased to have the Federal Government take a hand in the affairs.

Denver, July 4.

#### Boulder County.

Near Eldora the power plant of the Mogul mine is running and the air drills are in operation.—The Fourth of July tunnel is making progress. It is in 1845 feet and last week the drills cut two small streaks that show ore.—The United States G. Co. tunnel is being driven to cut the Monroe dike.

#### Clear Creek County.

Work has begun on the Silver Plume and Grays Peak railroad, near Silver Plume, the final surveys having been made. The distance from the Baltimore mine to the Santiago mine in the East Argentine district by this route is about 9½ miles. It is estimated the grading can be completed in two months with 200 men employed. A mill will be built at the Baltimore mine to treat the ores of the Hazelton-Santiago Con. properties and all the mines of the East Argentine district. The completion of the railroad will benefit the East Argentine section as the ores of the district will be transported at a low

figure, the present price of hauling being high.

Ore shipments from Idaho Springs for the first three weeks of June show increase of 65% over the same period of last year, says the Times. The three weeks' output for this year is 149 cars against 90 last year. While not so large as the production, the incoming shipments, principally of merchandise and coal, also show increase. For the same period 284 cars were received this year as against 191 last year.

#### Dolores County.

The San Juan Ore Co. has been incorporated by P. D. Sexton, C. E. Nobles, E. A. Franke, F. A. Otis and C. H. Jones of Chicago, Ill., to engage in extracting and refining ores in Dolores county. The principal office is in Chicago, Ill., with the Colorado office in Denver.

#### Gilpin County.

The Grizzly mine, southeast of the Lutz property in Russell mining district, has been started up by Russell Gulch men, under lease and bond. The property is owned by W. C. Hood of Georgetown, and the main shaft is down 200 feet. They will clean out the shaft workings. They propose putting up a shaft building and plant of machinery. Those interested are M. A. Harris, D. Davies, E. R. Fouts, G. Miller and T. Turner.

A lease and option on the Nemaha group on Bobtail hill, near Central City, have been given to J. E. Sidwell of Chicago, and part payment made. The property is on Bobtail hill in Gregory district and consists of three patented claims. The Nemaha main shaft is down 450 feet and the shaft of the Nemaha extension is 100 feet deep, and it is intended to sink the main shaft to the 1000-foot point and the Nemaha extension shaft several hundred feet deeper. The property has produced smelting and milling ores.

The J. C. Robertson I. Co. of Colorado Springs will reopen the Lillian M. Co. mines of Gilpin county, says R. Willis of Colorado Springs. The Lillian is patented and is at Russell Gulch, adjoining the Old Town mine. The Lillian has shipped smelting ore which averages 3 ounces gold per ton from one shoot. The property is equipped and shipments will be made regularly. The president is F. S. Bannon, and E. S. Giles, superintendent.

With completion of retimbering the shaft of the Freedom mine, near Central City, from top to bottom, the Freedom has resumed shipments. Milling ore is being sent to the concentrators, as well as high grade ore to the smelters. Besides these shipments, several cars of first class smelting ore are lying in the stopes to be shipped to the Argo smelter. There are ten men employed, five men in breaking ore, two trammers, two timbermen and one engineer, and as fast as new mill holes and stopes are opened up more men will be put to work, and Manager Borchardt expects to have twenty-five men breaking ore by the 15th inst. In raising with the stopes from the 500 to the 400-foot level, a strike of a high grade streak of smelting ore was made, averaging 18 inches wide. The length of the ore shoot is 300 feet. The stopes are nearing the 400-foot level. In addition to this, stopes have also been started in the 571-foot level on a 3-foot iron streak and production is being made from that level also. The mill in Chase gulch, bought by the company, will be running this month on Freedom ore, and the proposed driving of the tunnel from Chase gulch through the Freedom Extension and along the Freedom vein towards the main shaft and Freedom No. 2 shaft, now operated by leasers, who are taking out good ore, will make quite an economical change in the operation of the property, as the entire output of the property will then go through the tunnel and be delivered directly to the mill. This will do away with hauling and treatment charges, and as this tunnel will tap the main shaft at least 300 feet below the collar, it means a saving of 300 feet of hoisting and pumping. Eighty tons of ore sent from the Freedom mine to the Rocky Mountain concentrator yielded 42 tons of concentrates which were shipped to the Argo smelters.

#### Gunnison County.

In Tin Cup district much work is reported going on and the prospect of getting a railroad is stimulating mining. The West Gold Hill M. Co. has thirty men at work driving the tunnel and putting up a 100-ton mill. A body of concentrating ore running \$12 per ton is opened up.—The Brunswick M. & M. Co. is refitting its mill. The tunnel is in 1150 feet. They are also drifting on the Little Mack vein and ore is being taken out.

A settling dam is being built by the Iowa M. Co. on the Bertha placer near Tin Cup. Fifteen men are at work and they will start washing gold this week. Developments are reported favorable

at the Woods Investment Co. property, and the mill will be started up next week to concentrate the ore in sight.—A strike has been made by Hubbard, Haynes & McManus on the Star mine on Italian mountain. A vein 7 feet wide, assaying 20 ounces silver and 30% lead was cut in the bottom of the 90-foot incline. They are drifting on the vein.—About twenty-five men are working on the Enterprise mine. They have large bodies of low-grade ore exposed in the tunnel, which is in 3000 feet.

The Spar C. M. & T. Co., with workings at White Pine, has been incorporated by F. W. Downs, W. D. McIntire, J. Landigra, E. E. Timm and F. N. Stiles.

The strike reported made by Hurley, McShane & Short on Copper mountain, 2 miles from Pitkin, toward Bowerman, has been opened up for 40 feet.—G. Brant, manager of the Golden Islet mine, has doubled the number of men. Two shifts are working in the raise and one shift in the drift. Machinery is being hauled to the property and building a 10-stamp mill has begun.

The Climax and Chicago claims have been sold to J. E. Phillips of Denver. These claims are in the Gold Belt and lie between the Golden Islet and Raymond properties, near Pitkin. Phillips will do extensive work on the property and will put in machinery.—A. E. Moyn, owner of the Maid of Orleans group of ten claims on east side of Quartz creek, opposite the Mineral Farm basin, is preparing to increase development. In the Maid of Orleans tunnel, which has been driven 100 feet, a 10-foot vein of ore is showing, which is said to run 12% zinc. On the Zinc King a 7-foot vein of 13% zinc is opened up.

Tin Cup reports say C. J. Carpenter and J. Waldron of Brunswick, N. J., interested in West Gold hill mines, comprising the Blistered Horn tunnel and Brunswick M. & M. Co.'s property, say arrangements have been made to drive the tunnel, which is in 1000 feet, ahead 1000 feet farther, which at that length will have a vertical depth of 1100 feet. At a point 500 feet from the present head, it is estimated the Jimmy Mack vein will be cut, where already the vein has been explored by shaft and drill holes to a depth of 900 feet. A. Lejune, manager, says ore bodies were shown by the drill holes. Beyond this point it is planned to cut the different contacts, such as the Gold Cup and Tin Cup contacts. It is planned to make trial shipments of milling-grade ore in carload lots.

#### La Plata County.

Between Wall and Kennebec gulches and about the Oro Fino hill, near Durango, there are from 200 to 250 men at work, either mining or prospecting, says the Times. Farther south in the Lightner creek sections several development enterprises are progressing. Since the May Day discovery in the south part of the district, which has shipped ore regularly, putting in heavier machinery, the Lightner country has been prospected more than formerly. The Sunrise lead, owned by the Three Metals Deep M. Co., 3 miles distant from the May Day, is said to be similar in its vein construction. Between the Lightner creek country and the May Day is Deadwood gulch, where prospectors are working on iron sulphide veins. The gold values in this section are low, with few exceptions, so far as surface workings have shown.

#### Park County.

The cyanide mill at Montgomery is now running on ore from the Magnolia dump. It is treating thirty tons per day.

The North London mine will add a night shift, says the Alma Bulletin. Work on the raise is going on steadily, but it is estimated that it will take until Sept. 15th to complete it.

#### San Juan County.

The weekly output from the mines of San Juan county is as follows, says the Silverton Standard: Silverton M. Co., four carloads of ore and one car of concentrates; Highland Mary, one car of ore; Gold King Con., twenty-one cars of concentrates; Silver Lake mines, twenty-one to twenty-eight cars of concentrates; Champion (from drift alone), one carload; Sunnyside, five cars of concentrates; Brooklyn, one carload of concentrates, also an occasional shipment of ore; Shendoah No. 3, two cars of ore; Dives, one car of ore; North Star Fraction, one car of ore; Iowa Tiger, irregular shipper in good quantity. The cars are loaded with twenty-five tons each. Approximately, the ores going out over the D. & R. G. from Silverton weekly aggregate 1400 to 1600 tons.—The Columbia mine, above Gladstone, J. Bordeleau owner, has started up with five men on contract work.

The Brooklyn mine, near Silverton, is supplying the mill at the Burro bridge with eighty tons of second-class ore weekly. This is concentrated four into

one. A retort of the amalgam from the plates is made for every carload of concentrates shipped. Besides this output, first-class ore is being sent out to the smelters weekly. Machinery equipment in the mill is being increased.

The Little Maud mine, near Silverton, through expiration of bond held by A. Rice et al., is being worked by H. Born, its owner. He claims a 23-inch streak of ore in the drift, which can be sorted to a high-grade product in paying quantity. The pumps of the North Star mine, on Sultan mountain, which were inadequate to control the heavy flow of water for sinking purposes have been "pulled."

The holdings of the Gold King M. Co. of Silverton have been sold to the Venture M. Co. for \$5,000,000.

#### San Miguel County.

The Nellie and Ella mines, on Bear creek, 2 miles from Telluride, are producing enough ore to keep twenty stamps of the San Miguel Con. 120-stamp mill running night and day. The pulverized ore is put through a fine mesh screen and from forty to fifty tons are treated daily. The ore carries uniform values in gold, running \$10 per ton. Large quantities of ore are reported blocked in the mines.

#### Teller County.

The Findley G. M. Co. and the Valley City G. M. Co., at Cripple Creek, the latter owning the Shurtleff No. 2 claim, are to be consolidated, says the Gazette. By the consolidation of these properties apex litigation will be prevented. In the Findley property three shifts of miners are at work continually, hoisting ore. It is said they are breaking the ore for a width of 40 feet.

Harrison & Seaver, lessees on the W. P. H. mine at Cripple Creek, are shipping a car of ore per day. The production from the W. P. H. during June was 750 tons. The ore gives an average of \$70 per ton. The greater portion of the ore being shipped is mined from a drift extended 130 feet west of the shaft at a depth of 325 feet. They have two other ore bodies, but work is confined to the bottom level.

The Shurtleff No. 2 claim, on Bull hill, Cripple Creek, containing 2.95 acres, has been sold to A. E. Carlton for \$250,000. Ore is being hoisted by three shifts and is being broken 40 feet wide.

Lessees operating the Sweet shaft of the Gold Bond Dev. Co., on Bull hill, Cripple Creek, will deepen their shaft an additional 275 feet, giving it a total depth of 400 feet from the surface. The shaft, which has reached a depth of 125 feet, has been sunk on the incline, but it is intended to straighten out the block before starting to sink. The new leasing company has a 4-foot vein in the bottom of a winze in the 125-foot level which assays two ounces gold.

Though the mines of Cripple Creek district were closed down, as well as the samplers, for one week—June 6th to 16th—the output is reported satisfactory. The mills, as well as the samplers, had to draw on the reserve ore or otherwise the output must have been lower than the figures given. May was the banner month since the strike was inaugurated August 10th last. The tonnage in June was 7800 tons less, the average value was \$1 lower, while the total value fell short \$288,800, says the Cripple Creek Times. The following table shows the ore treated by the mills and the smelters:

	Tons.	Value.
Smelters.....	8,500	\$340,000
U. S. R. & R.....	18,000	450,000
Portland mill.....	6,500	195,000
Telluride.....	6,500	210,000
Economic.....	2,400	96,000
Doreas.....	2,500	112,000
Homestake.....	6,000	34,000
Sioux Falls.....	2,000	8,000
Cyanide plants.....	500	2,000
Totals.....	54,200	\$1,607,000

#### IDAHO.

##### Ada County.

Boise reports say a smelter is to be built there. The Boise M. & S. Co. has been incorporated by J. Bartlett, J. Dillon et al. of Toledo, Ohio. The plant will draw ore from Pearl, Horseshoe Bend, Black Hornet and other districts near Boise.

##### Blaine County.

The Bullion and the Mayflower mines, near Hailey, will be reopened under management of H. S. Bunting of Chicago, Ill., who has a lease and bond. It has been shown, says the report, on the Minnie Moore that the disappearance of the silver-lead ore bodies is due to a fault in the formation, and the Minnie Moore is producing more ore than formerly, having a daily output of two cars, which brings in \$100 per ton. It is operated by I. E. Rockwell, et al., of Chicago, Ill.—The Quincy-Julia Co., which owns the Elephant mine, has had men on development work since last fall and has opened up ore in the workings. Shipments are expected before the close of the summer. —A great deal of new work is in

progress in the Little Wood River district, 40 miles from Hailey, and near the Muldoon mine. There are 100 men at work developing and prospecting. The most work has been done on the Bradley claims, from which shipments are being made which run 100 ounces in silver and 52% lead.—At Ketchum the Guggenheim Exp. Co. is working men on its claims.

##### Idaho County.

The New York C. M. & S. Co. has been incorporated to operate in the Upper Snake River mining district, above Lewiston, by J. J. Moynahan of Spokane, Wash., C. R. Kendall, A. J. Murphy, M. S. McDonald, A. McClaudin and P. E. Seelye. The company will develop and operate properties in the Eureka mining district on Innaha creek, 1 mile from the property of the Eureka M., S. & P. Co.

##### Nez Perce County.

The Rosetta M. Co., operating in Rosetta district, 24 miles from Lewiston, is putting in a 10-stamp mill with which to work its \$10 gold ore.

##### Shoshone County.

The Monitor mine, 7 miles south of Saltese, Mont., is being pumped out, preparatory to being worked. It is near the Bitter Root divide on the Idaho side.

##### Washington County.

S. Dorsey, J. C. Rogers and W. Hayward, who have a bond on the Blue Jacket group at Landore and on the old Peacock mine in Seven Devils district, have put men to work on development.

A company has been organized by C. Green et al. of Boise to dredge bars in the Snake river, 12 miles below Weiser. Plans for a dredging boat have been prepared and it is stated construction of the boat will begin this month. A 100 H. P. boiler and a 20 H. P. engine will be used. The dredger will handle 2000 yards of gravel per day at a running expense of \$60 per day.

#### KANSAS.

##### Cherokee County.

At Baxter Springs mining is reported active. About twenty shafts are sinking and considerable drilling is being done. —The Sunny Side mill is running steadily and making a ton of jack per hour. The mill is running ten hours per day, but work goes on underground night and day.—Ford, Troupe & Co.'s new mill has been fired up and the jigs are bedded. A large body of ore has been developed there.

The Dark Horse mine at Baxter Springs is hoisting ore, both lead and silicate.—D. B. Perkins has his shaft to the ore body. The drill showed a large amount of free ore there.—The Grace Hill M. Co. drill is down 80 feet in promising ground.—The Baxter M. Co. has begun drilling on the Mattie Dardenne land.

#### MISSOURI.

##### Jasper County.

In Webb City and Cartersville district the Mary Louise electrically operated mill on the Missouri Zinc Fields mine has begun operations, says Manager Coyne. He will not be able to run up to full capacity till next week, as the delay in the shipment of the hoister held him back on the opening up of the ground. It is said that electricity within the next few years will supplant steam in the district as the motive power for concentrating plants. —The Venture mill and lease on the Connor land have been sold to J. W. Durby.

The Stepp & Keyser mill, near Webb City, is closed down temporarily to put in a compressor, as the ground is in shape for use of more machinery.—The Great Scott tailings mill on the Aylor land has started operations, and on its trial run of some of the tailings produced ore at the rate of six tons per shift, says Manager Scott. He says the output can be run to thirty tons per week on single shifts, but owing to the fact that the Lucky Budge Nos. 1 and 2, Holy Smoke Nos. 1 and 2, Avondale Nos. 1 and 2 and Old Dominion are running double shifts, a night shift will be put on at the tailings mill. The plant has been wired for electric lights.

Hollingsworth & Co. of Cartersville, who have the lease of the Main street mining property, near Carthage, and have been opening up their ground, have put their mill in operation. In one shaft they made five and one-half tons of jack from 173 tubs of dirt, after bedding the jigs.—Ashcraft & Burch have completed another drill hole on the Ashcraft-Reynolds land, near the line of the Underwriters land, on which is located the Golden Rod mine, owned by W. R. Caulkins & Co. The ore was found at a depth of 172 feet and shows good cuttings to 184 feet, the usual amount of lead being found with the zinc. They have started a shaft on the first drill hole put down by them.

Transfer of 560 acres, of mining land north of Joplin has been made from the

Mexico-Joplin Land Co. to C. M. Wilson for \$200,000, says the News-Herald. Wilson will further develop the property with drills, which are being set this week. The land is surrounded by the Sherwood, the Creller & Young, the Lincoln-Mitchell and other producing mines on the west, Tuckahoe on the south and the new developments of Webb City parties on the east.

The Vandalia mine, near Joplin, has been sold at sheriff's sale to satisfy labor claims and other judgments, and was bid in by C. F. Brown for \$1075.

At Zincite the strike in the new shaft 300 feet south of the Scranton mill is reported improving.—The reorganized company on the G. B. Young land, consisting of R. Burr, F. McCrary, J. Walker and D. Powers of Zincite, and A. F. Place of Humeston, Ia., began work last week.

The Liberty Bell shaft, east of the Daisy Belle plant, near Zincite, is being sunk by contract.—Kirkpatrick & Son of Webb City are sinking a drill hole in their shaft west of Radish Hollow.—The First Iowa mine in Radish Hollow has struck ore in the shaft.—Many of the mines reported are having trouble with water.

##### Washington County.

T. W. Hill of Webb City has an option on eighty acres in Washington county and two shafts started. Good shines have been found, but it is all free ore, says Hill.

#### NEVADA.

##### Elko County.

M. M. Johnson, who has bonded the Greenback mine at Mountain City, says the sacked ore on the dump awaiting shipment averages 1000 ounces silver and \$32 gold per ton. In the Nelson group a drift is being run both ways on the 400-foot level on 4 feet of ore. In one drift 2 feet of this averaged \$20 gold and 200 ounces silver, and in the other drift 14 inches of ore averaged 400 ounces silver and \$10 gold per ton. The mill is crushing thirty tons of second-class ore daily, the coarse concentrates of which give an average of 230 ounces silver and \$15 gold, the fine averaging 65 ounces silver and \$200 gold per ton.

##### Lander County.

It is said the Tenabo M. Co.'s property at Cortez has been closed down for an indefinite period. Five men are retained to look after the property.

##### White Pine County.

The Ne Plus Ultra group is increasing production as a lead mine. A preliminary 75-ton shipment netted \$35 per ton, the ore running, in addition to gold and silver, 60% lead. A contract to deliver 2000 tons more to the same smelter has been signed, and a steam hoist will be set up this month. A new shaft has been started and it has reached a depth of 60 feet. The mine adjoins the Rocco-Homestake, near Hamilton.

#### NEW MEXICO.

##### Grant County.

The concentrating plant for the St. Louis mine, in the Burro mountains, near Lordsburg, has started up. The company has added five tables to the Frue vanners and is putting in two pumps with a capacity of 100,000 gallons daily; also, an electric light plant of seventy-five lights. New steel rails for the mine are being put in.

J. C. Woodward will start work on his Casino mine, near Lordsburg.

##### Lincoln County.

W. P. Thompson, superintendent of the coal mines at Dawson and at Coalora, says the mines are working with a reduced force, due to lack of demand for coal.

##### Taos County.

J. K. Turner, manager of the San Cristobal C. Co., near Arroyo Seco, says the company is working a dike of a low-grade ore which is 80 feet wide. The ore runs \$3 in gold per ton, and will be worked in the 40-ton cyanide mill in course of erection. Should it be proved that this ore can be treated at a profit, the company proposes to build a cyanide mill of 500 tons capacity.

W. Penn and J. Melson are working and developing the Melson mine at Red River and report having struck payable ore.

#### OREGON.

##### Baker County.

To reopen and operate the Virtue mine, near Baker City, the Virtue Mines Dev. Co. has been incorporated by J. K. Romig, S. L. Baer and C. A. Johns. The mine has been closed down for several months. It is 7 miles from Baker City and near the Emma mine. The ore is free milling.

#### UTAH.

For month of June the aggregate values of gold, silver, copper and lead output of Utah was \$1,780,200. In the preceding month, with thirty-one days, the value of the total output was \$2,004,700. For the output of copper matte from the valley smelters, the figures are slightly below those for May, says the Tribune. The difference can be partially explained by the two days' suspension at the Highland Boy smelter at Bingham when the new furnaces were being connected up. The estimated figures in pounds, including silver and gold with the unrefined copper, are 4,035,663 as against 4,326,000 for May. During the month the Utah Con. (formerly the Highland Boy) has increased its capacity nearly one-third by the addition of roasters and furnaces. The estimated figures in pounds are as follows:

United States.....	975,000
Blugham Con.....	990,042
Utah Con.....	1,126,621
American S. & A.....	938,100

Total..... 4,035,663

The dividends declared during the month were as follows:

Silver King.....	\$100,000
Daly West.....	72,000
Gemini.....	50,000
Annie Laurie.....	12,500
Grand Central.....	25,000
Tetro.....	3,000
Salvator.....	2,500
Century.....	3,000
Utah.....	1,000

Total..... \$269,000

##### Beaver County.

A strike is reported made in the Reciprocity mine, midway between the Horn Silver and the Cactus groups, near Frisco. The find was made at a depth of 60 feet from the surface and consists of 16 inches of silver-lead ore and from 6 to 12 inches of talc on each side of that. Assays show 42.5% lead, 80 cents in gold and 28 ounces in silver. Indications of copper are also coming in. The strike is in a fissure vein.

##### Juab County.

The management of the Swansea mine of Silver City has been unable to make satisfactory terms with the smelters for the profitable marketing of its large volume of low-grade fluxing ore exposed in the mine, says the Reporter, and there will be no resumption of operations and production.

##### Salt Lake County.

By August 15th the daily capacity of the Utah C. Co.'s works at Bingham will be increased from 450 to 600 tons of copper ore, says Manager Jackling. Thirty-two more Frue vanners will be put in. Work has begun on a 300-foot addition at the lower side and end of the present building. The crushing plant is capable of furnishing all the ore that can be handled by the extension.

J. P. McCarty says he is preparing to put in an oil drilling outfit on the tract of ground adjoining the holdings of Guffey & Gailey at Farmington. There are seventy-six acres in the tract.

The South Columbus M. Co. is preparing to operate machine drills at its mine at Alta, says Manager J. A. Jacobson. The company will secure its power from the Columbus Con. C. Co., which is ready to start its electric power and compressor plant. By 1500 feet of pipe the air will be conveyed to the mine. It is intended to increase development. It is said the vein opened up in the Alta-Quincy mine is in the territory of the South Columbus.

The Boston Con. C. Co. of Bingham will be equipped with a concentrator, says S. Newhouse. It is expected a start will be made before the close of the present season.

##### Plute County.

The Boston & Gold Mountain mine, near Marysville, is being prepared to resume work, says Manager Weal. The company will put up buildings and start work of extending the tunnel, which is in 260 feet. In addition to its Gold Mountain property, the company also owns mining claims (copper) in the Antelope district, and also a group of gold-copper claims in the Meadow Dry Creek country.

##### Tooele County.

It is said the output of the Ben Harrison mine at Stockton, owned by the Stockton G. M. & M. Co., will go to the Honerine mill, which is doing custom work in addition to treating the output of the Honerine mine, which averages 200 tons daily.

#### WASHINGTON.

##### Stevens County.

Ore is reported struck in the Nellie S. mine, near Chewelah, assaying \$20. The management has been drifting on the ore body for 40 feet, and there are 4 feet of ore in the face of the drift. The company is putting in machinery and will put in an engine, hoist and pumps.—W. W. Warner has charge of the Copper King property, in same district, and expects to start shipments from the mine this week.

They have opened up the ore body. Besides the Copper King and Nellie S. strikes there have been several other strikes in that district within the past month.

At Northport, the smelter of Le Roi C. Co., of Roseland, B. C., is running four furnaces at full capacity. The product being sent down from the mine is low in silica and is smelted with small charges of fluxing materials. The ore in reserve is fluxed with lime from the quarries near Northport and with iron ore being shipped from the Kootenay mine. It has been estimated that the end of July will see the last of the reserves of ore through the furnaces. Manager Wilson remains until end of that period. Beyond that, the company's plans are not given out.

A gold find is reported made on Sullivan creek near Metaline and Ione, on the Pend d'Oreille river. C. Gilmore, while prospecting for placer ground, found a 10-foot quartz ledge showing free gold. Other ledges have also been located.—The Whirlpool Placer M. Co. has placer diggings below the Gilmore ledge in which the pay dirt is reported high grade. The gold is coarse. The placer company has a good waterfall and is preparing to start hydraulic mining. The diggings are reached by train from Spokane to Newport and thence by boat down to the Pend d'Oreille river.

## WYOMING.

### Laramie County.

Guernsey reports say once more a large number of men are at work on the iron mines of the Colorado Fuel & Iron Co., and the 400 tons of ore mined daily will be increased to 1500 tons a day. By an agreement made, the Colorado & Southern is to transport all the ore from the mines, at Guernsey, to Pueblo, Colo., the shipments over the Burlington via Sidney, Neb., being discontinued. All of the ore being mined is taken from the four-compartment shaft, the ore heretofore having been mined in deep cuts with steam shovels. By deep mining ore of a higher value is obtained.

Cheyenne reports say J. Morris has made a strike in the Hecla mining district, west of Cheyenne. At a depth of 25 feet he opened up a vein of ore 4 feet in width, running \$30 per ton in copper and silver. Several Denver, Colo., companies, including the Hecla G. & C. M. & M. Co., own claims in the district.

## FOREIGN.

### AFRICA.

#### Rhodesia.

The Tanganyika Concessions, via Bulawayo, report at the Ruwe mines the April gold output was, from sluice boxes 349 ounces; March output, 300 ounces.

### AUSTRALIA.

#### New South Wales.

At the Broken Hill Proprietary mines at Broken Hill the output for four weeks ending June 15 (including product from ores bought), was as follows: Refinery products—Fine silver, 437,149 ounces; soft lead, 5531 tons; antimonial lead (estimated), 36 tons.

### BRITISH COLUMBIA.

#### East Kootenay District.

E. J. Roberts, representing C. Sweeney owner, says the Sullivan mine smelter at Marysville will be completed and operating early in September. He says his company will handle the ores of the Slokan country, and especially the "dry" ores. The Sullivan smelter is 25 miles from the Slokan country, in a direct line, but by railroad is about 75 miles.

After an idleness of two years the St. Eugene mine at Moyie is in full operation, with 300 men employed.

#### Nelson District.

The Ymir G. M. Co., at Ymir, reports for month of May: Forty stamps ran 28 days and 19 hours, crushing 2950 tons of ore, producing 789 ounces bullion, value (gross), \$8450; 220 tons of concentrates, shipped, gross estimated value, \$6250; cyanide plant treated 2090 tons of tailings producing bullion, estimated value, \$1100; sundry revenue, \$900; total, \$16,700. Working expenses, \$15,000. Development expenses during month, \$1690.

E. J. Stratton et al. of San Francisco, Cal., owners of the Mount Alamo M. Co., have bought the Pingree group of claims on Forty-nine creek, near Nelson. There are six claims in the group. There are three ledges—two of copper-gold ore about 5 feet wide and one of free gold 2 feet 8 inches wide. Men will be put to work this week developing the property.

#### Roseland District.

At the Cliff mine, near Roseland, E. L. Tate et al., of Spokane, Wash., are resuming work. At the start ten men will

be employed under R. Angus. By August 1st thirty men will be at work on the Cliff. The management will equip the mine with a compressor plant. In parts of the vein the ore is said to run 5% in copper. The question of transportation will have to be solved, although the wagon road from the mine to the railroad is in fair condition and a new road to the nearest loading point could be built at comparatively low cost, says the Roseland Miner. Eventually a spur will be run from the Canadian Pacific to a point below the mine, delivering the ore by tramway at the terminus of the spur.

#### West Kootenay District.

J. McGlone of Philadelphia, Pa., and C. E. Ehrehart of Hanover, Pa., report making final payment of \$11,000 on the L. B. group of claims at Trout Lake, in the Lardeau, for the Lucky Boy M. & M. Co. of Philadelphia. The total amount for which the property was bonded was \$23,000. The property has shipped \$30,000 worth of ore since it has been taken over by the company. Work is temporarily suspended on account of the lack of pumps to handle the water. The necessary machinery will be put in.

## CANADA.

### Nova Scotia.

R. M. Pope, manager and half owner of a gold group near Halifax, reports work progressing. It is the North Star mines, 50 miles southwest of Halifax, on Chester bay. It covers 1800 feet of a vein of low-grade, free-milling gold ore. The former owners had developed it with a 200-foot shaft, but encountered water and worked out the best of the ore on the 200-foot level. R. M. Pope and P. H. Moore have put in a 5-stamp mill and a sinking pump. The mill has been running since May 15. Men with an air drill were put in the bottom of the shaft and others began drifting on the 12-inch vein. The average value of the rock is said to be \$20. P. H. Moore has three claims there. A 10-stamp mill erected at one of the claims burned down, but will be rebuilt. The Canadian mines remain vested in the crown and 2% royalty is collected on the output, but twenty year leases are given, and the tax is not found to be onerous. Miners, Pope says, can be hired at \$1.50 and \$1.75 a day. Living is correspondingly cheap.

#### Yukon Territory.

Dawson reports say the gold output to June 30th has been \$150,000 more than during the same period last year. The season's output is estimated at \$13,000,000.

### CHINA.

#### Fukien.

U. S. Consul S. L. Gracey, at Fuchau, writes that French mining men have been making examinations of the mineral resources of the northwestern prefectures of Fukien for the last two years and have found deposits of coal and gold. These both give promise of profitable returns; the Societe d'Etudes du Fukien has applied for mining concessions in the districts of Kienning, Shaowu and Tungchow. A British company during same period has been exploring mining districts in the southern part of the province, near Amoy, but has not yet succeeded in obtaining satisfactory arrangements, as it is also asking for privilege of building a railroad from the mines to tide water at Amoy. The rights are secured through the mining board at Peking and the approval of the provincial authorities.

### COLOMBIA.

The Darien G. M. Co. at Cana reports during month of May having crushed 1569 tons of ore and obtained 1463 ounces of gold, of value of £5744. The new shaft was sunk 23 feet and raised 35 feet. They are dropping twenty stamps.

### MEXICO.

#### Chihuahua.

It is reported a deal is under way on the Puerto Rico mines, and the 10-stamp mill of E. C. Creel, near Sahuayacan, in western Chihuahua, for sale to G. F. Ellis of Santa Barbara, Cal., and P. B. Weare of Chicago, Ill. The Puerto Rico mines belong to Mexican mining men. The ores are silver-gold.

The Chicago-Mexican M. Co. has been incorporated to take over the Chicago silver mine, 40 miles west of Cusihuiriachic. The mine is owned by P. McDonald et al., who will start work this week. The officers are C. B. Reed, T. W. Gilmore, J. B. Myers and J. T. Costillo of Chicago, Ill.; P. McDonald is superintendent and J. B. Myers is secretary and manager.

T. H. Oxnham, manager of the Palmarejo & Mexican G. F., Ltd., operating mines near Chinipas, says that the unusually dry season has hampered milling operations at Palmarejo, but good rains

have fallen the past month and the mill is resuming normal capacity. Development on the mines is progressing favorably.

E. M. Parrish, of Parral, with F. Howard, is developing properties at Guazapares, in western Chihuahua.

#### Guerrero.

The Carrizal gold mines, near Carrizal, owned by a New York company of which J. R. Butler is president, are under water. The mines were flooded as a result of blasting in the face of the tunnel at the ninth level. The shots opened up a flow of water. Pumps are being put in to unwater the mine. The management is arranging for a complete electric plant and hoist.

#### Jalisco.

M. G. Perez, of Guadalajara, has taken over the "antigua" Spanish mines known under name of La Estrella del Sur y Anexas, and is organizing a company to work them. The mines are on the Una de Gato mountain in the southern part of Jalisco, two days' ride from Zapotiltic, a station on the Zapotlan branch of the Central. Two of the mines, the San Pedro and La Fortuna, are full of water. The ores produced by the mines in the past were largely of native silver, a specimen weighing two kilos, and assaying all but 60 grams pure silver. There is a wagon road from Zapotiltic to the mines.

The capacity of the mill at the Lupita mine, west of Ameca, owned by Colorado Springs, Colo., men, and managed by P. Fitzgerald, will be increased by addition of five stamps. A pipe line is being built to increase the water power. Ore has been blocked out in the Lupita. With the increased capacity of the stamp mill it is expected to increase the production to \$75,000 per month.

The Keystone C. S. Co., at Tapalpa, under management of A. L. Waters, has put in another boiler and the plant will run to full capacity. The company operates a smelter, concentrating plant and stamp mill. Shipments of copper matte have already been made.

F. W. Page, general manager of the United Mexican M. & M. Co., is putting in machinery for the fine-ore furnace completed at the cinnabar deposits owned by the company, near El Moral. The stack of the furnace has a height of 132 feet, and there are 14,000 square feet of condensing surface outside of the main conveying flue. The company has denounced the majority of the cinnabar deposits around El Moral, and development work is in progress at four, the Jesus Maria, Ojo de Agua, La Mexicana and La Evallina. At the Jesus Maria mine a tunnel 500 meters in length is being driven. The 100-ton custom mill which the United Mexican M. & M. Co. is preparing to build will be on the San Geronimo hacienda in Navidad district. The site of the mill is 30 miles from Mascota and five hours' ride from El Moral, which is also 30 miles from Mascota. In connection with the mill there will be a chlorination plant, reverberatory furnace, concentrating tables and a sawmill. The sawmill equipment is now being taken overland from Ameca, but the mill equipment will not be shipped until after the rainy season. The holdings of the company include 2000 acres of timber land. The ore of Navidad district are silver-gold.

It is reported that W. C. Greene of Cananea, Sonora, is interested in the company which is preparing to work the Rosa Amarilla copper mine in Autlan district. This property lies on west slope of the Sierra Madre and is accessible from the Pacific coast. Operations will be increased and the property equipped with facilities for heavy production. A standard gauge railroad will be built from the mine to the Pacific port of Navidad. The mine will be equipped with machinery and reduction works.

The San Rafael M. Co. of Guadalajara is working silver-lead property at Parnaso, 65 miles southwest of Ameca. The mine has been producing for a year and is equipped with a 5-stamp mill and table concentrators. They are putting in a plant to treat the tailings. The works have been handicapped by a scarcity of water for the past several months, but arrangements have been made for increased water supply. F. M. Fouts is superintendent.

The San Antonio M. Co., operating a 10-stamp mill, amalgamating pans and settlers on the Santiago river, six hours' ride from Hostotipaquillo, reports doing a large amount of custom work. This is due to development of mines in Hostotipaquillo district, and to the fact that the mines owned by the company are not at present producing heavily. L. P. Larson of Fremont, Neb., is president, A. Lundvall is manager, and J. O. Worden, superintendent. The plant is on the site of an old "hacienda de beneficio" (metallurgical works), which was established about the middle of the 18th century. The arrastras and patios of the ancient system

are said to be still capable of use. The plant is operated by steam and water power. The company owns the San Antonio, Verde and Palomas mines and a half interest in the San Jose mine. The products of the plant are shipped to San Marcos, the terminus of the Central branch.

The general scarcity of labor in Mexico at the present time is affecting the mines of Jalisco to some extent, says the Jalisco Times of Guadalajara. Within the past few months hacendados (ranch managers) have raised the wages of farm laborers from 25 cents per day to as high as 75 cents per day, and as a result many men have deserted the mines for the haciendas. At many of the mines laborers who formerly received from 40 to 50 cents a day are now receiving from 60 to 75 cents.

#### Sonora.

The cyanide plant of the Creston-Colorada M. Co. at La Colorada, is completed and is expected to be in operation next week, says Superintendent Doveton.

#### Tepic.

The Castellanos mines, near Ixtlan del Rio, are again at a standstill, says the Jalisco Times. These mines were sold two years ago to an English company in which W. Pearson and the MacArthur-Forrest Cyaniding Co. are interested. Machinery was put in, including a seventy-ton concentrating plant, and preparations made to operate the mines on a larger scale. For a time the production averaged \$30,000 per month.

#### Zacatecas.

The San Rafael El Grande M. Co., of which A. E. Stilwell of Chihuahua City, Chihuahua, is president, has bought thirteen mines in the State of Zacatecas. The principal of the mines is the San Rafael, and arrangements are being made to unwater it. Pumps will be set up in the Late shaft which is 1200 feet in depth. By taking the water out of the Late shaft, the San Luis shaft, which is 600 feet in depth, will be cleared, and as soon as this is done the old workings will be cleaned out and sinking resumed. Since the Stilwell interests obtained control of the property, mining operations have been carried on only in the upper workings of the San Luis shaft, which were clear of water. The ore there is of a low grade.

\*\*\*\*\*  
 Personal.  
 \*\*\*\*\*

F. J. McNAIR has returned to Leadville, Colo., from Denver, Colo.

F. G. KING of Redding, Cal., is in San Francisco, Cal., on mining business.

T. F. WALSH of Washington, D. C., is in Colorado, looking after mining interests.

F. A. THOMPSON is superintendent of the reduction works at Forks Creek, Colo.

F. J. HERTHAL, Jr., of Soulsbyville, Cal., is in San Francisco, Cal., on mining business.

W. J. DOUGLASS, a mining superintendent of Virginia City, Nev., is in San Francisco, Cal.

W. G. SCOTT has resigned as superintendent of the Continental-Alta mine at Alta, Utah.

E. J. SNYDER, manager of the Sonora M. & M. Co., is in Nogales, Ariz., from Utica, N. Y.

J. W. PHILLIPS, a mine manager of Silver City, Lyon county, Nev., is in San Francisco, Cal.

O. R. HARRINGTON is superintendent of the Anita copper mines, 40 miles from Williams, Ariz.

E. J. BUMSTED is assayer and civil engineer at the Highland Mary mine, Silverton, Colo.

W. W. WARNER is manager of the Copper King mine, near Chewelah, Stevens county, Wash.

J. M. HYDE, Professor of Mining in the University of Oregon, at Eugene, is in San Francisco, Cal.

J. STORM returned last week to Denver, Colo., from Silverton, Colo., and is now in Leadville, Colo.

F. SUTTON, interested in Tuolumne county, Cal., mines, is in San Francisco, Cal., from Sonora, Cal.

JESSE J. MACDONALD is examining mining property for the Mendoza C. C. M. Co. at Triunfo, Baja Cal.

J. JACOBS, superintendent of the Sultana mine at Angels, Cal., returned there last week from Colorado.

C. W. LEIMER, formerly of Denver,

Colo., is mill superintendent of the California King G. M. Co., at Pico, Cal.

G. DERN, manager of the Con. Mercur G. M. Co., is in charge of the company's mines and mills at Mercur, Utah.

R. A. F. PENROSE JR., mining engineer and geologist of Philadelphia, Pa., has gone to Australia on professional business.

H. T. POWER, manager of the Hidden Treasure mines, near Michigan Bluff, Placer county, Cal., is in San Francisco, Cal.

CHAS. N. TIBBITTS, general manager of the Mine & Smelter Supply Co., has returned to Denver, Colo., from the East.

R. N. JONES, formerly in charge of the Cornucopia mines, near Baker City, Or., for several years, is again in charge.

J. KASSON of Hillsboro, N. M., has returned there from making mine examinations in Graham county, Arizona.

J. W. ASTLEY, manager of the Snow Shoe mine at Phoenix, B. C., returned last week from a trip to England.

C. M. FUELLER has returned to Denver, Colo., from Socorro, New Mexico, where he was examining mining properties.

I. L. BRYNER AND R. H. SMITH, interested in oil properties at Coalinga, Fresno county, Cal., are in San Francisco, Cal.

E. H. POWER, manager and principal owner of the Rodman Bay mines, near Juneau, Alaska, is at the company's mines.

W. F. DUBOIS of Seattle, Wash., is superintendent of the Continental-Alta mine at Alta, Utah, vice W. G. Scott, resigned.

W. A. CLARK of Butte, Mont., owner of the United Verde copper mines at Jerome, Ariz., is in New York from a European trip.

R. ANGUS, at one time superintendent of the Le Roi mine at Rosslund, B. C., is superintendent of the Cliff mine, in the same camp.

JOHN ROSS, JR., superintendent of the Wildman-Mahoney mines at Sutter Creek, Cal., has returned there from San Francisco, Cal.

W. W. WORTHING, superintendent of the Rhetta Con. mine near Plymouth, Cal., has returned to the mine from San Francisco, Cal.

E. J. WILSON has resigned as manager of the Northport, Wash., smelter of the Le Roi Co. of Rosslund, B. C., to take effect August 1st.

R. D. SEYMOUR, manager of the Denver, Colo., branch of the Trenton Iron Co., has returned there from Chicago, Ill., and St. Louis, Mo.

M. J. AND W. P. O'MEARA returned last week to Salt Lake City, Utah, from a business trip to Nevada mines covering several weeks' duration.

R. M. POPE, formerly of Salt Lake City, Utah, owner and manager of gold mines near Halifax, Nova Scotia, is visiting in Salt Lake City, Utah.

J. S. ICKIS, part owner of the Barranca del Oro mine near Ixtlan del Rio, Tepic, Mexico, returned there last week from Guadalajara, Jalisco, Mexico.

L. W. TRUMBULL, E. M., has been elected to the chair of mining engineering and geology, University of Wyoming, vice W. C. Knight, deceased.

A. H. BROWN has resigned as superintendent of the Golden Gate mill of the Con. Mercur G. M. Co. at Mercur, Utah, to engage in leasing at Mercur.

W. E. BEATTY of Eureka Springs, Ark., has sold his Venture mill and mining lease at Webb City, Mo., and has returned to Eureka Springs, Ark.

CHARLES T. ALLEN, manager of the Union Steam Pump Co. of Battle Creek, Mich., has been unanimously elected president of the City Bank of that place.

H. C. HOLTHOFF, manager of the Power & Mining Machinery Co. of Milwaukee, Wis., is in Denver, Colo., on business connected with his company.

T. H. OXNAM, manager of the Palmarajo & Mexican G. F. Ltd., has returned to the mines of the company, near Chinipas, Chihuahua, Mexico, from England.

G. A. TWEDDY, until recently superintendent of the Boston quicksilver mine at Knoxville, Cal., has opened an office in Los Angeles, Cal., as consulting engineer.

J. K. TURNER, formerly with the Copper Hill M. Co., near Rinconada, N. Mex., is manager of the San Cristobal C. Co., near Arroyo Seco, Taos county, N. Mex.

A. W. MCCUNE, manager of the Cerro de Pasco copper mines, at Cerro de Pasco,

Peru, is in Salt Lake City, Utah, from Peru, having stopped at New York, en route.

PRESIDENT J. DERN of Salt Lake City, Utah, of the Con. Mercur G. M. Co. of Mercur, Utah, attended the annual meeting of the company at Jersey City, N. J., this week.

MANAGER C. W. WHITLEY of the American S. & R. Co. plants returned last week to Salt Lake City, Utah, after visiting the Pacific coast and a number of Nevada mining camps.

E. W. JONES, superintendent of the Cerro Azul Con. M. Co., operating near Imuris, in Magdalena district, Sonora, Mexico, has returned there from a seven week's visit in Mesa, Ariz.

J. ANNAND, former superintendent of the Tom Boy mill, near Telluride, Colo., has returned to Denver, Colo., from Obuassi, Ashanti, West Africa. He will spend some time at Delta, Colo.

C. M. BECKER, formerly assistant manager of the Smuggler-Union mine, at Telluride, Colo., is manager of the Stratton's Independence, Ltd., at Victor, Colo. W. W. Trevall has been appointed assistant manager.

PROF. W. F. DURAND of Cornell University, at Ithaca, N. Y., has been appointed as head of the department of mechanical engineering at Stanford University, Palo Alto, Cal., vice A. W. Smith, resigned, to become head of Sibley College of Mechanical Engineering at Cornell.

\*\*\*\*\*  
**Commercial Paragraphs.**  
\*\*\*\*\*

THE office and salesroom of the Hercules Gas Engine Works of San Francisco, Cal., has moved into the new building, No. 63 Mission street.

A HANDSOME MAP in colors, correctly portraying the territory of the Russian-Japanese war and adjoining regions, is received from the Vulcan Iron Works Co., Toledo, Ohio.

THE Machinery Supply & Implement Co., 1926-30 Lawrence Street, Denver, Colo., are supplying the machinery and material for the testing plant of C. M. Strong, Ward, Colo.

A. M. MATTICE, chief engineer of the Allis-Chalmers Co., has returned from his European tour of inspection and has now settled down to the duties of his position in Milwaukee, Wis.

WALTER H. WHITESIDE has been appointed general manager of sales for the Allis-Chalmers Co., including the sales of their electrical department, i. e., the Bullock Electric Manufacturing Co.

A 50-TON concentrating mill, including Bartlett tables and all other machinery, has recently been ordered from the Colorado Iron Works Co., Denver, Colo., by the Ruby Basin M. & M. Co., of the San Juan district, Colo.

H. C. BOSWORTH, formerly with the Denver Fire Clay Co. of Denver, Colo., has retired from that firm and is now in the City of Mexico, where he has bought an interest in the assay supply business of the Hoffman-Pinther Co.

THE Durable Wire Rope Co., 16-24 Atlantic avenue, Boston, Mass., have installed in Machinery Building, Block 34, at the St. Louis Exposition, a full line of samples of their wire rope. They have also a ropedrive in operation.

A SHIPMENT of portable balances has recently been made by the Denver Balance Co., 3000 Larimer Street, Denver, Colo., to Bolivia, South America. They state they have received orders for their balances the past week from Butte, Montana, and Baker City, Oregon.

B. F. STURTEVANT Co. announce the removal of their entire plant from Jamaica Plain, Boston, to the new works at Hyde Park, Mass. With nine acres of floor space and modern appliances they will continue to manufacture blowers, engines, motors, economizers, forges, steam heating, ventilating and drying apparatus.

THE Holtzer-Cabot Electric Co., Boston (Brookline), Mass., have some time ago discontinued the issuing of a general catalogue, and publish instead special "bulletins" of the different electrical specialties manufactured by the company. These cover a wide range of electrical goods and will be sent to interested parties upon request by mentioning the MINING AND SCIENTIFIC PRESS.

THE Wetherill Separating Co., of 52 Broadway, New York, have their separators on exhibition at the Universal Exposition, St. Louis, in the Mines and Metallurgy Building, New York State

space (block 21): Type "E" No. 3, separating magnetite from hornblende and apatite; North Carolina Geological Survey space: Type "E" No. 1a, separating monazite from garnets and gangue.

JOHN W. CARY, formerly with the Mine & Smelter Supply Co., Denver, Colo., has formed a partnership with Thomas Fielding at 1711 Tremont Street, Denver, Colo. They represent the Power & Mining Machinery Co., manufacturers of the American Crossley gas engines, Loomis-Pettibone gas generating system, the Evans-Waddell Chilian mill and the Holthoff Mining Machinery. They will also handle the Rand Drill Co.'s line of machinery and are agents for the Rand "Rack-a-rock" powder.

AT a recent meeting of the stockholders of the Brown Corliss Engine Co. of Corliss, Wis., the stockholders voted on a proposition to increase the working capital \$150,000. This is designed to put the company in splendid financial shape, and to be in a position to carry on some of the largest work on the market. The Brown Corliss Engine Co. are building an up-to-date engine, and have one of the most modern shops in the country. With the increased capitalization they should be able to increase their business materially.

THE Star Brass Manufacturing Co., 108 East Dedham street, Boston, Mass., have recently issued their annual catalogue of over 300 pages, dealing with the steam engineering specialties which they manufacture and which are in use on battleships, cruisers and torpedo boats of the U. S. Navy, transatlantic steamships, electric light and power stations, factories, mills and mines. Copy of this catalogue may be obtained, by responsible persons, by addressing the company and mentioning the MINING AND SCIENTIFIC PRESS.

THE Allis-Chalmers Co. cordially invite MINING AND SCIENTIFIC PRESS readers to use as headquarters the facilities they have provided at their power exhibit in the Machinery Building at the St. Louis Exposition. The 5000 H. P. Allis-Chalmers engine and the Bullock electric generator which form this exhibit, furnish electric energy for the decorative lighting for the buildings and grounds of the Exposition. The installation stands in the center of the Machinery Building, with sufficient space about it to afford views of the largest generating unit ever placed on exhibition.

THE S. H. Supply Co., dealers in new and second-hand machinery and supplies, Twenty-second & Larimer Streets, Denver, Colo., have enlarged their quarters, and now occupy the second story of the building for their main office, the lower floors being used as a display and sales rooms. On Twenty-second Street, opposite their place, they have a building, 50x75 feet, used for store room for plumbers' supplies; on Larimer, directly opposite their main office, they have 50x50 feet for supplies; farther up on Larimer, near Twenty-third, a two-story building, 125x100 feet, is used for electric mining and milling machinery. In this building they will have in operation all of the types of concentrators, second-hand, including Wilfleys, Wilds, Bartletts, vanners, etc., and will have on exhibition the various makes of milling machinery. They have in contemplation a warehouse on the tracks, to be 300x100 feet. Since January 1, 1904, they state they have shipped eighteen carloads of machinery east of the Mississippi river and are now shipping nine carloads of Babcock & Wilcox boilers to Ashland, Ky. In a short time they state they will be manufacturing and selling the Wild line of machinery, including concentrators, mills, crushers, roasters and milling machinery.

\*\*\*\*\*  
**Obituary.**  
\*\*\*\*\*

J. R. RYAN of Virginia City, Nev., superintendent of the Con. California & Virginia, the Ophir, Andes and Hale & Norcross mines, and superintendent of the Comstock Pumping Association, died at St. Louis, Mo., on July 1st. Deceased was a native of Brighton, Mass., 55 years of age. He was miner and later assayer of the Carson City, Nev., U. S. Mint under the first administration of President Cleveland. For the last twelve years he has been in charge of mines on the Comstock. A wife and daughter survive him.

#### Dividends.

The Bunker Hill & Sullivan M. & C. Co., Idaho, July 5, dividend No. 81, \$75,000, a total paid since January 1st, 1904, of \$363,000, and total paid to date, \$1,896,000.

\*\*\*\*\*  
**Books Received.**  
\*\*\*\*\*

"Gold Assaying" is the title of a book on this important branch of metallurgy by H. J. Phillips. Unlike most works on assaying, this volume treats of gold assaying only. A chapter is devoted to the occurrences of gold, and others to the sampling of gold ore, and a thorough treatment of assaying apparatus and practice, not only of ores but of solutions in the cyanide, chlorination and other processes. In the appendix is found much miscellaneous and valuable information, beside tables of weights and measures. 138 pages, illustrated. D. Van Nostrand Co., 23 Murray street, New York. Price \$2.50.

#### New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 380 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING JUNE 28, 1904.

763,652.—HOSE COUPLING—J. A. Allen, Seattle, Wash.  
763,655.—GAS APPARATUS—C. M. Baker, S. F.  
763,657.—RAIL LUBRICATOR—M. W. Bird, Seattle, Wash.  
763,654.—FILTER BEDS—H. W. Blaisdell, Los Angeles, Cal.  
763,730.—HYDRAULIC LIFT—R. W. Campbell, S. F.  
763,563.—CULINARY UTENSIL—C. Canciani, Sonoma, Cal.  
763,594.—HOSE NOZZLE HOLDER—Annie L. Chubb, Oakland, Cal.  
763,541.—RANGE—Q. Crane, San Diego, Cal.  
763,470.—WRENCH—A. D. Erb, Hubbard, Or.  
763,475.—EXERCISING MACHINE—Frazee & Whitcomb, S. F.  
763,878.—SCHOOL DESK—Gilson & Rowe, Oakland, Wash.  
763,480.—HORSE RELEASE—F. C. Goettfert, Seattle, Wash.  
763,879.—SASH FASTENER—M. L. Gordon, Los Angeles, Cal.  
763,880.—SEWING MACHINE—G. I. Green, S. F.  
763,386.—FORCIPS—J. F. Hemphill, Arlington, Or.  
763,891.—HARVESTER—C. Hesse, Red Bluff, Cal.  
763,607.—UPHOLSTERY SPRING SUPPORT—J. Hoey, S. F.  
763,609.—SIDEWALK ELEVATOR DOORS—P. H. Jackson, S. F.  
763,663.—SIGNAL—H. L. Jennings, Clifton, Ariz.  
763,612.—THAWING GROUND—C. W. Joynte, Seattle, Wash.  
763,492.—DRAWER GUIDE—W. Laakso, S. F.  
763,773.—ROTARY MOTOR—C. A. Marlitt, Portland, Or.  
763,919.—GAS GENERATOR—P. Meyer, Santa Rosa, Cal.  
763,568.—PIPE DRESSING MACHINE—O. Quandt, Los Angeles, Cal.  
763,932.—NUT LOCK—J. M. Schofield, Stockton, Cal.  
763,573.—WATER WHEEL GOVERNOR—D. W. Starrett, Oakland, Cal.  
763,519.—PURSE AND HOSE SUPPORTER—Taylor & Flint, S. F.  
763,824.—WELL DRILL—H. H. Wilburn, North Yakima, Wash.  
763,584.—EXHIBITION CASE—D. Woods, S. F.

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

UPHOLSTERY SPRING SUPPORTS.—No. 763,607. June 28, 1904. John Hoey, San Francisco, Cal. The object of this invention is to maintain spiral vertical springs which are used in certain classes of upholstery work in a vertical position, and it consists in a means for supporting and uniting these springs at both top and bottom in such a manner that with any compression or extension they practically maintain the vertical lines, and they are also united transversely by an elastic support.

LOCKING AND INTERLOCKING ATTACHMENT FOR SIDEWALK ELEVATOR DOORS.—No. 763,609. June 28, 1904. Peter H. Jackson, San Francisco. This invention relates to improvements in means for locking and interlocking doors such as are closable horizontally upon sidewalks or other places, and especially when used in conjunction with elevators which run between the basement and sidewalk level. The object of this invention is to lock and interlock such doors without requiring the operator to be on the rising or falling platform. It comprises automatically interlocking hook-shaped latches, one of which is weighted and has a connection by which it may be disengaged from the other to allow the doors to be opened as the elevator rises.

HOSE NOZZLE HOLDER.—No. 763,594. June 28, 1904. Annie L. Chubb, Oakland, Cal. The object of this invention is to provide a means for holding and directing hose nozzles in the sprinkling of lawns and the like. It comprises a conical spring between the coils of which a hose may be fitted and supported at any desired angle or position and from the upper coil of the spring the wire is returned centrally through the cone to provide a shank of sufficient length to be thrust into the ground, the opposite end of the spring being knotted or secured upon this shank.

WATER WHEEL GOVERNOR.—No. 763,572. June 28, 1904. D. W. Starrett, Oakland, Cal., assignor of three-fourths interest to F. D. Nowell, Juneau, Alaska. It is the object of this invention to provide a means for maintaining a substantially constant rate of speed for a momentum water wheel such as are driven by the impact of a stream of water under a high bill, such a water wheel having peripheral buckets, and a discharge nozzle delivering water into said buckets is provided with deflectors movable with relation to the nozzle so as to impinge upon the surface of the column and by means of a clutch mechanism a wheel and brake is operated between a fixed shoe and an annular shoe revolvable with the wheel.

HYDRAULIC LIFT.—No. 763,720. June 28, 1904. R. H. Campbell, San Francisco, assignor of one-half to Harron, Rickard & McConne of San Francisco. This invention is designed to be used in placer mines and pertains particularly to means

employing hydraulic jet for lifting gravel, tailings and the like above their original bed and depositing them on a higher level. The invention comprises a series of loosely arranged aligned metal sections, peripheral annular grooves and packing bands, tie rods for holding the parts together and an exterior casing embracing the intervening sections. In conjunction with these is a removable throat liner for the uplift pipe and yielding packing is fitted between the intermediate sections and the liner with means for holding the several parts together.

**REVOLUBLE EXHIBITION CASES.**—No. 763,584. June 28, 1904. David Wood, San Francisco, Cal. The object of this invention is to provide an apparatus in which photographs, pictures and the like may be mounted upon structures which are turnable in various ways so as to exhibit the pictures consecutively. In conjunction with these picture supports is a general turnable frame upon which they are mounted and means by which said frame may be moved to expose any desired picture. A slidable shutter is so connected with the mechanism that reciprocation of the shutter will partially revolve the supporting apparatus. Supplemental independent revolvable frames are mounted upon the main frame and means are provided by which these will be turned at stated intervals.

## Latest Market Reports.

SAN FRANCISCO, July 8, 1904.

### METALS.

**SILVER.**—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58½c, refined (1000 fine); San Francisco, 58½c; Mexican dollars, 47½c San Francisco, 46½c New York.

Within the week silver has advanced in price both at home and abroad. The New York quotation is 2 cents higher than that of last week. In his recent visit to San Francisco, Geo. D. Roberts, Director U. S. Mint, said there would be no more new silver dollars coined in any United States mint, the silver bullion purchased under the Sherman law being now all minted.

**COPPER.**—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$12.87½; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper, \$17.00; bars, 18@24c. London: £57 5s spot per ton.

**LEAD.**—New York, \$4.35; Salt Lake City, \$3.50; St. Louis, \$4.25 San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 13s 9d long ton.

**SPELTER.**—New York, \$4.95; St. Louis, \$5.00; London, £22 5s ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

**TIN.**—New York, pig, \$25.60 @ 25.80; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, \$30 @ 32½c. London, £117 spot.

**PLATINUM.**—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

**QUICKSILVER.**—New York, \$44.50 @ 45.50, large lots; London, £8 San Francisco, local, \$43 @ 43.50 per flask of 75 lbs.; Denver, \$46.00. Export, \$43.00 @ 43.50.

**BABBITT METAL.**—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

**SOLDER.**—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

**ZINC.**—Metallic, chemically pure, \$1.10, 50c; dust, \$1.10; sulphate, \$1.10, .04c.

**NICKEL.**—New York, 40@47c per lb.; ton lots, 40@47c.

**ALUMINUM.**—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

### STRUCTURAL MATERIALS.

**IRON.**—Pittsburg, Bessemer pig, \$12.85 @ 13.35; gray forge, \$12.00; San Francisco, bar, 3c per lb., 3½c in small quantities.

**STEEL.**—Bessemer billets, Pittsburg, \$23.00 @ 23.00; open hearth billets, \$23.00 @ 23.00; San Francisco, bar, 7c to 12c per lb.

**WHITE LEAD.**—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less

than 500 lbs., per lb., 7c; in 25-lb. tin pails, 7½c per lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, 7c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

**LUMBER.**—(Retail): Pine, ordinary sizes, \$24.00 @ 25.00; extra sizes higher; redwood, \$28.00 @ 30.00; lath, 4 feet, \$4.50 @ 5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @ 35.00.

**NAILS.**—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

**LIME.**—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

**CEMENT.**—Imported, \$2.15 @ 2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.45 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

### GENERAL SUPPLIES.

**ANTIMONY.**—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300 @ 500-lb., 8½c; 100-lb. lots, 10½c.

**POWDER.**—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

**CAPS.**—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

**FUSE.**—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

**CANDLES.**—Granite 6s, 16 oz., 40s, 11½c per set; 14 oz., 40s, 10c.

**CHEMICALS.**—Cyanide of potassium, 98½%—99%, jobbing, 23@24c per lb.; carloads, 23@23½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20 @ 1.40 per 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3¼@3½c; alum, \$2.00 @ 2.25; California refined, 1¼@2c; sulphide of iron, 8c per lb.; copper sulphate, 5¼@5½c; chloride of lime, spot, \$2.50 @ 2.75; sulphuric acid, in carboys, 66% B, 1¼@2c per lb.; nitric acid, carboys, 8c per lb.

**OILS.**—Linseed, boiled, bbl., 49c; cs., 54c; raw, bbl., 47c; cs., 52c; Lucol oil boiled, bbl., 45c; cs., 50c; raw, bbl., 43c; cs., 48c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 68c; Sperm, crude, 63@68c; Natural White, 70c; Bleached, do., 80c; Whale Oil, cs., 52@57c.

**URANIUM.**—Oxide, per lb., \$3.50. (These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## SITUATIONS WANTED.

**ASSAYER, WITH KNOWLEDGE OF BOOK-keeping, wants position with mine or mill. Address J. L., this office.**

**EXPERIENCED ASSAYER DESIRES POSITION** with mining and milling company. Thoroughly competent in bullion, control and analytical work. Best of references. Address "Bullion," care of this office.

**EXPERT MINE FOREMAN WANTS POSITION.** Competent to handle extra difficult conditions underground. Address "Limestone," Room 602, 330 Market St., S. F.

**MANAGER OR SUPERINTENDENT FOR A** gold, silver or copper property; 20 years' experience in different parts of the country. All references. Can furnish any bond. Mexico preferred. Address D., this office.

**MILL AND CYANIDE SUPERINTENDENT** wants position. Thoroughly understands milling of gold ores and the cyaniding of same. Good assayer. Address D. A., this office.

**MINE SUPERINTENDENT IS OPEN TO ENGAGEMENT** with a live company. Thoroughly understands his business. Address B. R., this office.

**POSITION DESIRED AS SUPERINTENDENT** to develop or operate mine and small mill; will do own assay work; would accept part salary in stock; experienced all round man; excellent references. Address "Dividend," care of this office.

**WANTED, POSITION AS SUPERINTENDENT** of mine and mill; amalgamation and concentration; competent assayer and analyst; good references. Address "Vanner," care of this office.

## HELP WANTED.

**WANTED AT ONCE, A PRACTICAL ALL** round Miner and Mill Man for gold mine now being developed in South America, Republic of Colombia. Climate good. Must speak Spanish and be able to handle peon labor. Must thoroughly understand cyaniding and other modern methods and be competent to take entire charge of mine at times in absence of superintendent. Must not be a drinking man, but a pusher. Young man with technical education and Western experience preferred. Good references required. Chance to advance. Address, stating salary expected with full particulars, South American Development Co., R. 410 Ft. Dearborn Bldg., Chicago, Ills.

## Michigan College of Mines.

F. W. McNAIR, President.

A State institution located in and making use of an active mining district. New Metallurgical Building and Gymnasium completed in the fall of 1904. For Year Book and Record of Graduates apply to President or Secretary. Houghton, Mich.

**CYANIDE TANKS ERECTED.**—Having been engaged in erecting steel Cyanide Tanks for the past six years, and having erected tanks at the following well-known plants—Ymir, B. C. San Sebastian of C. A. Octave of Arizona, Seal of Gold of San Bernardino, Cal.,—which in each instance have given perfect satisfaction, always using the labor at hand and thereby making a great saving to the company in traveling expenses for skilled labor, I am prepared to make engagements for further work. Can furnish the best of references as to ability and workmanship. Address Box 25, this office.

**HENRY CAREY BAIRD & CO.,**  
Industrial Publishers, Booksellers and Importers,  
810 Walnut St., Philadelphia, Pa., U. S. A.  
Our New and Revised Catalogue of Practical and Scientific Books, 92 pages, 800.; a Catalogue of Books on Metallurgy, Mining, Prospecting, Mineralogy, Geology, Assaying, Analysis, etc.; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc.; and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

## THE BURT EXHAUST HEAD

stands alone as the greatest known invention for the prevention of water and oil escaping from the exhaust pipe and to deaden noise of exhaust.

"If we had 100 more exhaust pipes we certainly would not be satisfied until we had them all equipped with the Burt Exhaust Heads."—Zeeland Milling Co., Zeeland, Mich.

The time to order is NOW. Send size of pipe; if dissatisfied, return.

**THE BURT MFG. CO.,**  
Largest Manufacturers of Exhaust Heads in the World,  
221 Main St., Akron, Ohio, U. S. A.  
Supplied also by Engine Builders, Dealers and Power Contractors.

## FOSTER VALVES.

## A Foster Back Pressure Valve

has neither weights, levers nor direct acting springs, and will sustain a constant back pressure without clattering, hammering, or noise of any kind.

For complete details of this valve and our other specialties, see a Foster Catalogue.

## Secondary Enrichment.

The secondary enrichment of ore deposits by the oxidation of the ores of the sulphide zone, and the reprecipitation of the minerals under conditions which were favorable to their redeposition, at lower levels, has come to be accepted as a fact, but there are instances wherein it is difficult to account for the extreme richness of some of the ore found in the zone of enrichment. The phenomena have been chiefly studied with reference to the copper deposits at Butte, Montana, which appears to offer the most tangible evidence to support this really rational theory. It was recognized for many years, before the "secondary enrichment" theory took definite shape, that the iron gossan of many copper-bearing deposits had been deprived, to a great extent, of the copper contents, and that in many instances, beneath the "iron hat" was found a zone of rich carbonate and oxide ores of copper, beneath which again was an enriched sulphide zone, in which the ores were usually "glance" and similar minerals with high values in silver or gold, or both. It was realized or believed that these rich zones were the result of the precipitation of ores from the oxidized surface portions, but the secondary enrichment theory, as now generally understood, had not yet been offered to account for these occurrences. In most cases where the secondary enrichment of copper ores had occurred the amount of superficial ore which has been leached has evidently been sufficient to furnish all the copper found in the zone of enrichment. There are, however, other deposits, wherein the enrichment must have been produced by the continued precipitation of solutions from below within the zone of and during the period of oxidation, for no other theory could account for the unusual richness of the ores, and their amount. Take as an example the rich chloride silver-lead deposits of Fryer Hill, at Leadville, Colorado. The famous mines of that flat eminence—the Robert E. Lee, Matchless, Little Pittsburg, Annie, Little Chief, Chrysolite and others—all within the oxidized zone, and occurring relatively within a few feet of the surface and above the horizon of local

Buildings of the U. S. Reduction & Refining Co., Colorado City, Colo. (See Page 40.)

drainage, and consequently of possible secondary enrichment—produced millions of dollars. It is now a well-known fact, long since established, that the normal ore of the lead-silver mines of that district are low-grade pyritous ores, containing an abundance of zinc sulphide and some copper sulphide, and that the normal ore, with a few exceptions, is low in silver. On Fryer Hill there was not enough ore available above the level of these rich deposits to have sup-

plied the large amount of silver chloride and sulphide found in those noted deposits, within the zone of secondary enrichment, consequently the large amount of silver, mostly as the secondary products of the alteration of silver sulphide, must have been derived from below, not necessarily from the ore lying in the immediate neighborhood of the rich superficial deposits, but more probably from solutions which continue to rise from great depth, and which supplied the ore found in the normal deposits. There is no evidence, in fact, that these solutions are not still rising, and by their slow and imperceptible action still forming ore bodies. The evidence furnished by the exposure of the rock strata in mine workings in Leadville district leads to the conclusion that the ores were formed in nearly horizontal beds at great depth—not less probably than 10,000 feet, and that the faulting, which is such a marked feature of the district, geologically, topographically, and incidentally commercially, occurred long afterward, but there is no evidence that the mineral solutions are not still coming up from the barysphere.

It is an established fact that minerals are being deposited in certain fumaroles and hot spring formations, where the solfataric action is still in evidence, as at Steamboat Springs, Washoe county, Nev., and at Sulphurbank, Cal. Curiously enough, the principal mineral deposited in each of these instances is cinnabar, though at the former place, it is said on good authority, both gold and silver also exist. An attempt was recently made to mine at Steamboat Springs, a shaft being sunk in the deposit, which, had it proven successful, would doubtless have furnished much valuable information in reference to the formation of mineral deposits; but the great heat of the workings, the sulphurous gases, hot water and the low grade of the ore found made the attempt commercially and practically abortive.

The Comstock Lode at Virginia City, Nevada, affords one of the most notable examples of extensive mineral deposition as a result of solfataric action, and without doubt mineral is still being deposited in that system of fissures. To what the bonanza deposits owe their origin is a matter for discussion.

THE development of water power and of electric power generated by water has become one of the most important of modern engineering undertakings. The cost of plants built for this purpose varies greatly both in the United States and abroad. In France it is stated that this cost ranges between \$25 and \$150 per horse power generated. It is probable that small plants generate power at a lower cost per plant than large ones, though it is also probable that the large plant generates power and is maintained at a lower cost per horse power than the small plant. The cost per horse power per month is also variable, though in many instances the charge is arbitrary and far higher than it should be, competition being the only means by which the power users may hope for better terms from companies distributing power. The cost of electric power can only be compared with the cost of generating and applying power by other means. Electric power in and about a mine at a cost of \$6 per horse power per month may be found more economical than steam or water power at \$5 per month, owing to the easy facility with which the electricity may be applied in a variety of ways, both above and below ground. It can be utilized to run hoists, to run fans and pumps, mills and crushers. It furnishes light and may be applied to various branches of the metallurgical equipment.

FOR more than a quarter of a century Leadville, Colo., has been a steady producer of lead, gold, silver, copper and zinc. The total output was estimated January 1, 1904, at about \$310,000,000. Since then the monthly output has exceeded 60,000 tons of ore, being in June 66,000 tons. The developments of the past few years in Leadville have extended the known area of profitable mineral, and it is improbable that its limitations have yet been fixed, and still further extensions may be anticipated. The history of Leadville has been a most interesting one. At first a placer gold camp, later a producer of rich silver-lead ores, and the past few years, by reason of

the constantly expanding operations, it has been enabled to maintain a large output of both precious and base metals. Many important changes in lead smelting and refining have been the result of the experience gained in that district, and it is likely to have an era of long continued prosperity.

## The Zinc Industry.

Zinc ore concentrates from Leadville, Colo., go this week via San Francisco, Cal., to Belgium for treatment, illustrating another phase in metallurgy. Prior to 1898 Leadville did not ship zinc ores for the zinc values therein alone, the market being limited, the grade being about three-fourths that of Missouri jack, and the freight charges to Kansas smelters precluding possibility of profit. In the last three years the reduction, or rather separation of zinc ores in and around Denver, has been a promising commercial proposition in special works apart from the rescinding by the smelters of the former penalty imposed by the latter on lead-silver ores carrying more than 10% zinc. The Belgium shipment of 5000 tons zinc concentrates is from Pueblo, because of the present inability of the zinc smelter there to handle it.

The zinc industry of the United States is a growing one, and is strikingly illustrative of the development of the nation's mineral resources. Thirty years ago the United States supplied about 7000 tons zinc. Even up to 1898 the annual production was under 100,000 tons. Since then increased output in the vicinity of Joplin, Mo., and development of the Colorado zinc fields has brought the annual production up to about 150,000 tons. And the increase of supply hardly keeps up with the increase in demand for that useful metal. In 1902 the United States used 160,000 tons spelter; in the previous year Europe used 165,000 tons for roofing purposes alone.

The increase in price is also noticeable—from \$10 per ton for zinc ore in 1875 to \$30 per ton in 1901, and a present figure of \$40 per ton is a remarkable advance.

It is estimated that of the 160,000 tons used in this country in 1902 about 51½%—82,400 tons—were used by the steel companies, largely for galvanizing purposes; brass foundries used 23%—36,800 tons; 16%—25,600 tons—was made into sheet brass; 2%—3200 tons—was used for roofing; a similar percentage was used in desilverizing lead; about 1%—1600 tons—was used for gold extraction in the cyanide process; 3%—4800 tons—was used for casting and monumental work. The remainder was used in electrical storage, etc.

## The Militia in Labor Troubles.

The militia company at Grass Valley, Cal., has recently decided to disband by a two-thirds vote, and it has been announced that the company will be mustered out. The organization is largely made up from the membership of the miners' union of that town, which appears to be the reason that this step has been taken. The statement has also been made that the recent action of the military authorities in Colorado has hastened this step, which has long been in contemplation. Ordinarily the voluntary disbanding of a militia company would be viewed with regret, if it were merely a lack of interest in the perpetuation of the organization; but it is evident from the reports coming from Grass Valley that the members of the militia anticipate the possibility of being called upon to preserve the peace in the event of labor troubles, and that it is to obviate such possible unpleasantness that they have adopted a precautionary measure and determined to remove themselves from the danger of such possibility. Under the circumstances, it is undoubtedly the best thing they could have done, for if in the event of lawless actions arising from labor troubles they can not be depended upon to protect life and property when called upon by the State, it were better for them to disband. As far as known, there is no immediate or even remote prospect of serious trouble in the mines of California; but that State has once before afforded the spectacle of a militia company refusing to obey its officers when called upon at the time of a strike, and in view of that fact, the action of the Grass Valley company, though demoralizing in its influences, is the more readily understood.

## The Disadvantage of Rich Ore.

The Tuolumne County, Cal., Miners' Union has called a strike at the Jumper mine, near the village of Stent, because of what they consider an obnoxious order issued by the management of that mine. For years the Jumper mine has been noted for the rich specimen ores it occasionally produces, and at one time the mine was worked for pockets of gold only, all low-grade ore, or that which did not show visible gold, being considered too poor to mine and mill. Within recent years a change was made in mine methods and now, for most part, a zone of rock of considerable width, within which the gold specimens occur, has been mined and the entire rock mass sent to the surface to be crushed in the mill. Where rich gold specimens are found in a mine the temptation for miners to appropriate a portion of the gold is a strong one, and one to which, on occasion, some have been known to yield. In the past there has been some experience of this character at the Jumper, and it is presumable that the workings have again entered a rich shoot, as the obnoxious order complained of by the men is one requiring them to "strip to their naked bodies" just after coming off shift and before passing from one apartment of the change house to another. The men declared this to be humiliating, and after refusal on the part of the management to rescind the objectionable order, struck July 3d. The mine is closed and 150 men are idle. This is not the first time where the management of a specimen producing mine has considered it expedient to require the miners to strip, and it is probable that the management of the Jumper has a good reason for issuing such an order at this time. This appears to be one of the disagreeable features of operating a specimen producing mine.

THE announcement of the discovery of diamonds in their matrix on Oakley creek in New South Wales, Australia, will doubtless stimulate the search for the source of diamonds in other districts where these gems are known to occur. Diamonds are now won from their matrix in South Africa, in India and to a limited extent in Brazil, the greater number of diamonds from the latter coming from conglomerate, which is thought by geologists not to be their original matrix. In California diamonds have been found in the beds of several ancient rivers in several counties, and in Wisconsin diamonds have been found in the glacial drift. Diamonds are also reported from Georgia and North Carolina, but in none of these States are there any authenticated records of diamonds having been discovered in their matrix. There are numerous localities in the United States, however, where the rocks are remarkably similar to the noted "blue ground" of South Africa. This rock is similar in appearance to some serpentines and was originally an olivine rock, a variety of peridotite. The rocks became altered and partly serpentinized, and are of dark bluish green color in depth, though usually yellow at the surface, due to decomposition. Although rocks of this description are of frequent occurrence in the United States, no diamonds are reported as occurring in it.

ANOTHER interesting, and what may prove to be a long-contested and expensive, lawsuit involving the extralateral right is to begin on the 21st inst. at Denver, Colo. This is a contention between the Morning Glory Gold Mining Co. against the Mary McKinney Gold Mining Co., and involves the right to follow what is known as the Republic vein, which is said to apex on the Aileen location of plaintiff. The contending parties to this litigation endeavored to settle the affair by arbitration, but after each side selecting an arbiter, these two were unable to agree upon a third, and in consequence the matter will be carried into the courts. In a district where the fissure system is as complex as that of the Cripple Creek district there is likely to be considerable difficulty in the settlement of the differences between the contending parties.

SINCE the labor troubles in Colorado are for the time being, at least, at an end, the mining industry has once more taken on new life and the outlook for a large production during the year 1904 is promising, although it may fall short of the normal output.

## CONCENTRATES.

THE radio activity of a number of minerals was recognized several years prior to the discovery of radium. Uranium minerals have long been known to be radio active.

\*\*\*\*\*

AN undercurrent is a broad table having a low inclination and covered with burlap, cocoa matting, rifles or some other materials or devices for catching fine gold. They are placed so as to receive the fine material discharged from sluice boxes through a grizzly or screen.

\*\*\*\*\*

THE grade of quicksilver ore which will pay to mine and reduce depends the same as in any other ore upon the conditions surrounding, the amount of ore available, character of ground, and other things influencing mining cost, as well as the cost of fuel used in roasting the ores.

\*\*\*\*\*

"BARYSPHERE" is a word which in recent years has come into use in the discussion of the genesis of ore deposits. It is used to indicate a deep-seated region in which the minerals are of higher specific gravity than the average of those found at and near the surface of the earth.

\*\*\*\*\*

IN 1884 an act of Congress provided "that the rules and regulations of the General Land office and Department of the Interior governing the administration of the mining laws of the United States be adopted for and extended to the district of Alaska, so far as the same may be applicable."

\*\*\*\*\*

IRIDIUM occurs with platinum and other metals in the platinum ores, but most commonly as osmiridium. Iridium is much like platinum, but is brittle, fuses with great difficulty and has a specific gravity of 22.4. It is not soluble in any acid, not even in aqua regia, in which it differs from gold and platinum.

\*\*\*\*\*

THE "law of the apex" is responsible for nine-tenths of the mining litigation in the United States. The extralateral right law was introduced in British Columbia several years ago, and though it was in operation but a short time before being repealed, it led to litigation which has not yet been wholly settled.

\*\*\*\*\*

AURIFEROUS SULPHURETS may be successfully treated by amalgamation in pans or arrastras after being subjected to a "dead roast," that is roasted until completely desulphurized, but the attempt is rarely made, it being considered cheaper and more satisfactory to recover the gold by chlorination or cyanide process.

\*\*\*\*\*

BREA is a Mexican name for the black tar-like bituminous mineral found oozing from rock strata, principally from shales and sandstone. It represents an intermediate stage between normal petroleum and asphalt. When the latter condition is reached, nearly all the volatile constituents of the oil have disappeared, while in the "brea" some of them still remain.

\*\*\*\*\*

VARIOUS FABRICS have been successfully used to concentrate black sands and sulphide minerals from sand and crushed ores by passing them over inclined tables. Cocoa matting, burlap, blankets and Brussels carpet have been used for this purpose, but in recent years canvas has generally replaced the other materials. Formerly skins were also used for a similar purpose.

\*\*\*\*\*

IT is almost impossible to outline a line of treatment for ores by the cyanide process without exhaustive experiment. In a general way it may be said to consist in pulverizing the material to be treated if it is not already in that form; the separation of the material by means of hydraulic classifiers into coarse sands and slimes; the leaching of the sands by percolation and the treatment of the slimes by agitation and decantation, or filter pressing.

\*\*\*\*\*

REAGENTS are substances which are employed to produce noticeable changes in minerals, in order that their composition may be tested and the constituent elements become known. Reagents are dry, wet or gaseous. They should always be plainly labeled to prevent the likelihood of a mistake by some of them being misplaced. Many reagents have a marked physical resemblance, and labeling saves uncertainty and avoids errors which might otherwise occur.

\*\*\*\*\*

WHEN it is desired to concentrate the valuable minerals in an ore it is necessary to crush the ore sufficiently fine to free the valuable mineral particles, but sliming should be avoided, as it renders the subsequent operation of concentrating far more difficult. Often high-grade minerals, particularly the silver-bearing minerals, slime readily, so also does chalcocypite and mispickel. With this class of ores it is advisable to take extraordinary precautions against sliming.

\*\*\*\*\*

WHERE gravel is cemented with clay and is found difficult to wash without puddling, it is often found advantageous to allow the gravel to lie for several months exposed to the weather, which causes it to disintegrate,

and it is then easily washed in the sluices with little loss of gold. The occurrence of clay in gold-bearing gravel often causes a considerable loss of gold, not only due to the fact that the gold is not readily freed from the clay, but gold already freed is sometimes picked up by the rolling balls of clay and carried by them to the tail-race. This kind of gravel can sometimes be worked over two or three times with profit.

\*\*\*\*\*

WING DAMS are constructed for various purposes, but generally for placer mining a portion of a river bed under water. The wing dam is built partly across the stream and then is turned down stream and extended a greater or less distance. Often the lower end is carried back to the same bank as that where the construction commenced above. The water is then pumped out and mining begun, and continued until all the inclosed area has been worked out. If the amount of water seeping in is too large to be handled by sluicing, then dredging, or elevating by hydraulic ejector is resorted to. Wing damming is only resorted to when it is believed the amount of water to be handled is comparatively small.

\*\*\*\*\*

A GOOD dryer for concentrates and ores that are to be shipped or to be pulverized by dry crushing may be made by laying a series of pipes horizontally and about an inch apart in a suitable frame or box, the pipes so arranged that either hot water or steam may be passed through them in a manner similar to steam heating radiators in buildings. The pipes are laid on the floor of the dryer, which may be 10 feet square or of any desired dimension. The space between the pipes up to the level of their upper surface may be filled with sand, and on this the ore or concentrates are placed, heat being supplied by an ordinary steam boiler or special heater for water. A device of this construction is inexpensive and will thoroughly and quickly dry substances placed upon the floor, from which they may be easily removed by shoveling.

\*\*\*\*\*

A MINING LOCATION may be made on a lode, vein or deposit which does not outcrop on the surface, but which is discovered in a shaft. In the case of flat or nearly horizontal deposits the locator labors under the disadvantage of not knowing the direction of the strike of his ore shoot, for in ore beds occurring in sedimentary rocks, it is unusual for the ore to be found extending in an unbroken sheet over a large area. It is generally found in a deposit of irregular form, longer in one direction than in another. If the strike of other shoots of ore in the vicinity, or the strike of the dikes, if there are any, be known, it will be safe to locate in the direction of these known shoots and dikes. In the Black Hills the ore shoots occurring in the sedimentary formations have a northwesterly strike, which corresponds to the general strike of the dikes cutting those formations and to that of the underlying Archean schists.

\*\*\*\*\*

CONCERNING the question of damages to property from mining operations by the removal of ore beneath the surface, the State of Colorado has enacted the following law: "When the right to mine is in any case separate from the ownership or right of occupancy to the surface the owner or rightful occupant of the surface may demand satisfactory security from the miner, and if it be refused, may enjoin such miner from working until such security is given. The order for injunction shall fix the amount of the bond." Idaho, Wyoming and South Dakota have similar laws, but these have never been tested in the highest courts. The owner of the surface owes the same duty to the miner as the latter owes to the former. The surface proprietor has no right to in any way damage the property of the miner, nor in any manner illegally interfere with his operations underground.

\*\*\*\*\*

THE ore of mercury (quicksilver), from which the supply of commerce is obtained, is cinnabar (HgS). The natural compounds of mercury are few and, with the exception of cinnabar, are of limited occurrence, and most of them, when found, are usually associated with cinnabar. Native mercury is comparatively rare. Calomel, Hg<sub>2</sub>Cl<sub>2</sub>; metacinnabarite, HgS; tiemannite, HgSe; Onofrite, H (S<sub>2</sub>Se) with Se; coloradoite, HgTe, are the other known minerals of mercury. Cinnabar, pure, contains 86.2% Hg, and calomel, 84.9% Hg. In Europe, the most important deposits of cinnabar are at Almaden, Spain, at Idria, Austria, and Bakmut, Russia; in the United States at New Almaden, Cal. A noticeable fact is that all of the principal mines of cinnabar in the world are in connection with bodies of serpentine associated with sandstones and shales. The Latin name for cinnabar was minium, which is now applied to natural red lead (Pb<sub>3</sub>O<sub>4</sub>), it having been used as an adulterant for cinnabar.

\*\*\*\*\*

THE cost of smelting in reverberatory furnaces is stated by E. D. Peters in his work, "Modern Methods of Copper Smelting," to be for a furnace treating thirty tons of ore in twenty-four hours and having the slag removed by a stream of water, per shift of twelve hours: One fireman, \$3.50; one-half skimmer, \$2; one-half laborer, \$1.50. Total, \$7. He says such a furnace will burn about eight tons of fair coal per twenty-four hours, at \$6 per ton, or about \$1.60 per ton for fuel. (The necessary comparison should be made with oil.) Black-smithing and other slight expense about the furnace, \$0.17 per ton of ore. Repairs, including bottoms, vary greatly under varying conditions, but is about \$0.16 per

ton of ore smelted. To the above add \$1000 annually as a sinking fund to replace the furnace in five or six years. The total cost per ton, exclusive of general expenses and interest on investment, is: Labor, \$0.47; fuel, \$1.60; miscellaneous, \$0.17; repairs, \$0.16; sinking fund, \$0.10. Total, \$2.50. These figures are for Butte, Mont. If the operations contemplated can be carried on on as large a scale as that contemplated above, the cost of smelting should not be more excessive under the existing conditions stated in the inquiry than at Butte. In the case stated the gold alone in the ore should pay all expenses and leave a good margin of profit, exclusive of silver and copper. These costs do not include refining charges.

\*\*\*\*\*

THE variation of the magnetic needle in California depends on the location. In southern California it is about 15° east, in central California about 16½° east and in the northern portion of the State somewhat more. The magnetic variation changes constantly, though very slightly. It continues to move to the eastward for a period of years and then slowly moves westward. The movement is about three or four minutes annually. The daily variation is often as much as one-fourth of a degree. Often the magnetic needle is influenced by local causes, one of which is electricity generated by rubbing the glass covering the compass box, which causes the needle to tilt. This may be removed by touching the glass with the moistened finger. In order to lessen the likelihood of making mistakes by reading at times from one end of the needle and at others from the opposite end, it is better to always point the north end of the compass box toward the object sighted at and to read the bearing from the north end of the needle, which usually may be recognized by a small copper pin set transversely in that end of the needle. Most good compasses have an arrangement for "setting off" the magnetic variation, which simplifies calculation.

\*\*\*\*\*

WHERE it is desired to construct a dam in a torrential mountain stream, and where the volume of water varies from a rivulet to a roaring torrent, it is as economical to build a cheap temporary dam which will be carried out with each flood as to construct an expensive one of permanent character, for in streams of this description a basin formed by the permanent dam would soon be filled with debris, thus rendering the dam useless, or greatly impairing its utility. In such constructions the provision of a sluice in the lower part of the dam is necessary, and yet it may weaken the dam, for in torrential streams great boulders are often carried down which strike the dam with great force, and the sluiceway being unable to accommodate the flood is likely to become jammed with large rocks and cause much expense and trouble in their removal. A log and brush dam, if carried out, can usually be replaced at no great expense, whereas the cost of building a masonry or concrete dam would in most cases pay for a number of temporary dams. Concrete for piers and abutments is superior to either dry walls or masonry. This was shown recently at the time of a flood in Deadwood, S. D., when stone bulkheads and piers were swept away, while concrete piers standing in midchannel, and subjected to the full force of the flood and the debris borne on the current, are still standing. In numerous places in California mountains concrete piers have stood in the streams for years and will endure for many years to come. If abutments of this character are placed on bedrock on either side of a stream they will afford a substantial basis for the construction of log dams and render their replacing easy of accomplishment.

\*\*\*\*\*

A CLEANUP BARREL is usually run at about twelve to fifteen revolutions per minute, and twenty-four hours should be the minimum, but forty-eight hours is not too long to effect a good result. The operation is not intended merely to mix the contents of the barrel thoroughly, but to grind fine so as to completely amalgamate the minutest particles of gold present. The finer the grinding the cleaner will be the amalgam. The amount of quicksilver to be added in charging the barrel will depend on the quantity of material handled and its richness in free gold. For the grinding, any one of several things may be used—steel balls, round steel bars (pieces of old stamp stems or shafting), more or less flattened, water-worn boulders of quartz or flint or of a hard rock like a close-grained granite or diorite (10 or 12 inches in diameter). These last make most effective grinding agents, as they present a greater surface for action, and then the material ground from them does not collect with the amalgam, as do particles of steel or iron when stems or steel balls are used. When the grinding is completed, do not entirely free the cross-bar or the nuts holding the cover down. Partially free them and tap around the edge of the cover, loosening it gradually, as sometimes there is a gas generated during the grinding process which will exert enough pressure when the cross-bar and nuts are taken from the cover to blow the cover off and scatter mud over the cleanup room. After the cover is removed, turn in a stream of water and wash out the main portion of the slimes, which will run out with the overflow. Place a large amalgam kettle under the small hole in the bottom of the barrel and carefully unscrew the plug so that the amalgam will run out gradually, and not at one rush, as the latter is likely to result in loss. The iron scraps and bits (nails, etc.) are collected in pans with the coarser sands and panned down. The amalgam is cleaned with a porcelain mortar and pestle and the excess quicksilver squeezed out.

## The Young Quartz Miner.

NUMBER IV.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by  
MATT. W. ALDERSON.

The writer well remembers when giant powder was a new thing, and a representative of the manufacturers came into the little Western town where he was attending school and gave an exhibition of its superiority over black powder. In front of the school house a piece of the giant powder was placed on a boulder and on top of this a stick of wood. The explosion shattered the boulder as well as the stick of wood, and it was asserted that giant powder was different from other powder in that it expended its force downward more than in any other direction. This idea still seems to prevail in some minds, an expert at recent tests at the Stevens Institute of Technology at Hoboken, N. J., saying that, "unlike most other explosives, dynamite exerts practically all its crushing force downward and not in a general direction."

The practical miner soon finds out, however, that dynamite will only do the work it has a chance to do. If one drills a "dead hole" in massive rock, he may fail to break it and the exploding gas will simply find its way out of the hole. The fact is that dynamite is subject to the law governing all exploding gases—its tendency is "to expand equally and evenly in all directions. But if escape on one side be cut off by an unyielding wall, the lateral force of the explosion on the other side will be greatly increased."

There is but one safe way to thaw dynamite, and that is by the aid of hot water. Never under any circumstances should one attempt to thaw it with radiating heat, not even by the direct rays of the sun; for heat of this character is uneven, and when some point is raised to a temperature beyond that which is safe, an explosion may be easily caused. There are a number of good powder thawers on the market, but when one is where he cannot easily obtain such he may find a very good, inexpensive temporary expedient in a common oblong syrup can. This may be filled with hot water and taken to the mine. The powder laid on this will thaw while one is at work, and, covered with a cloth, keep warm for several hours. If necessary, even short candle ends may be burned under the can and the powder thus kept for any length of time as warm as may be desired.

In loading a hole, cut each stick of powder in two, then slit each piece down the sides, so that when it is placed in the hole it easily expands to fill the hole when pressed by the tamping stick. Ordinarily about three slits may be made. Into one of these slits in the last half stick used—called the primer—insert the cap, in which the fuse has been previously fixed and "crimped" with a crimper. Push the cap in, so it is lengthwise of the stick and in the powder just the length of the cap. In inserting the primer the tamping rod follows and the direct pressure is on the powder, and not on the cap. Exercise care to see that the powder is not pushed away from the cap. Some miners insert the cap in the body of the charge of powder. This is very bad practice, as there is always danger of the blast being set off by the heat of the burning fuse, in which case it will not be nearly so effective as it should be. For good work the blast must be fired by the detonation of the cap, and to secure this the cap must be in the end of the charge. One should not tamp the powder in the hole with his tamping stick as if he were tamping dirt around a post set in the ground. Dynamite is fired by concussion and one should avoid giving it blows, even with wood. One may tamp it as solid as he wishes by pressure, it being possible to exert a pressure of several hundred pounds to each push of the tamping stick.

The Coal and Metal Miners' Pocketbook says: "By experiment it has been proved that, as a rule, the length of charge of explosive for single holes should not exceed eight to twelve times the diameter of the hole—that is, a 1-inch hole should never have a charge of more than 12 inches of explosive placed in it. When several holes are fired together, this rule is sometimes slightly deviated from. It is usually best to employ a length of charge between these two limits, as, for instance, about ten times the diameter of the hole."

This rule will work very well if one is careful not to reach out after more ground than the charge will rupture. In general, however, Montana miners will use more powder. Take, for instance, a breast hole or dead hole in massive rock. The charge indicated would be just enough to spring the hole. If I were to give a rule, based on my own experience and observation of the work of others, I would say: Get all the explosive you can in the lower half of the hole. This would mean three sticks of powder in a 3-foot hole, and one and a half to two sticks in a hole 2 feet in length. Where this amount of powder will not do good work, you should spring the holes—that is, fire half a stick or a stick of powder in the bottom of the hole, thus "springing" or expanding it—then charge this chamber with such amount of powder as is necessary to fill it, usually three or four sticks.

Some miners save out a little powder when load-

ing, split the end of the fuse and insert the powder in the split ends, pressing them together again. A touch of a flame ignites the powder instantly. I am aware that dynamite may usually be burned with comparative safety, and that miners with whom I am acquainted have fired fuses in this way for twenty-five years; and yet I can never feel comfortable when I see it done. After loading, I turn the ends of my fuses up and split them down about  $\frac{1}{2}$  inch. When about to fire, I hang my candle on the wall and with a short candle end light the fuses by turning the ends of each one down over the flame. It is easy to light half a dozen fuses in this way before the smoke becomes oppressive, and one knows positively that each fuse is lit beyond the chance of any miss.

It is well for one to learn to put system into his work wherever possible. Some miners take their drills in to where they are to work and, leaving them in a pile, pick one out as they need it. It is better to stand the drills up in order at one's side. In drilling a hole, use the shortest as a starter, and, if it is not dulled in the first hole, stand it in place for use again. If it is dulled enough so it needs to be sent to the shop, throw it back by itself. Thus one does not waste time by picking up the wrong drill or in sorting out dull drills from those he is using more than once. It is well, also, to have an order in which one lays down his fuses as he is preparing to charge his holes. Some miners aim to cut their fuses all the same length for a round of holes. This is not easy to do and have the lengths exact. I am not so particular in cutting the fuses. Then, as I go to lay them down at the face where they are to be used, I straighten them out, lay the shortest near the face, the next in length back a bit, and so on. Then, in loading, I load the holes in the order in which I wish them to go off, picking up the fuse nearest me as I proceed. I light them in the order I have loaded them, and as the fuses vary in length, each succeeding fuse being from 1 inch to 2 inches longer than the preceding one, no two shots are fired at the same time and one may be always sure he has heard every discharge.

There are some things it is always well to do in view of a possible emergency, and then use care to see that that emergency never arises. Thus, one will do well to always carry a short piece of candle in his pocket. Then if, in working in a raise, his candle should drop from him, or he should otherwise lose it, he is protected from being left in the dark till he can recover the candle or get another. Some miners cut their fuses just long enough to give them time to get to a place of safety by the time the shots go off. It is better to make the fuses a few inches longer. Then, if one should stumble, or if by his quick movements or a strong draught his light should go out, he will have time to recover himself or relight his candle. A missed hole is something every good miner seeks to avoid, but with the greatest care they cannot always be prevented. In charging a hole, therefore, I always follow the primer with a piece of paper, usually a page of a mining journal from which I have clipped what I wish to preserve. In case of misfire, I know I may remove the tamping with safety down to the paper. I put in a new primer and the force of its discharge above the paper wadding will fire the powder below. Arrange to fire whenever possible when going off shift. If there is misfire, do not go back for at least an hour, as instances have been known of fuses being imperfect and the fire being held just long enough for the impatient miner to find his way back to the charge about the time it goes off.

If necessary to timber, see that the timbers used are sufficiently strong to stand any probable stress or crushing force. If an entry is to be timbered, allow for future settling. One will not miss it if he makes such a place 1 foot higher and wider than the present demands seem to require. Excellent works and articles on timbering are accessible and the young miner may familiarize himself with them to advantage.

Last, but not least, the young quartz miner should be a man of good habits. In some walks of life a man may stumble and pick himself up again. In many situations in a mine the man who makes a misstep has no chance for recovery. If he is careless in the use of explosives, he may not live to tell how the accident happened. The miner, therefore, should have a clear, active intellect. This he cannot have if he befuddles his brain by strong drink and neglects to read and think. Above all things, he must be careful. It is an old saying, "Want of care causes more loss than want of skill." The careless miner not only endangers his own life, but the property of his employer and the lives of those who may be employed with him.

A SUCCESSFUL cyanide operator advises dipping the zinc shavings in a solution of lead acetate when the ores contain copper, which becomes troublesome in the precipitation boxes. After packing the boxes with zinc shavings, turn on clear water and allow it to run until it carries no sediment or cloudiness from the boxes. When the water runs clear, turn in the cyanide solution. This destroys the tendency of the zinc to precipitate copper, and the gold and silver present in the solution is precipitated on the zinc practically free from copper.

## THE PROSPECTOR.

The rock sample from Holmes, Wyo., is a granitic dike rock, much altered, the feldspars having been altered in part to a silvery mica. Rock of this description occasionally carries gold, though usually not in large amount.

Two packages of rock samples were received from Tucson, Ariz., reported to be from Yavapai county, at Cottonwood, Ariz. In the first package the granite is a rather coarse rock, in which are visible quartz, feldspar and biotite. No. 1 is syenite, consisting of quartz, feldspar and hornblende. No. 2 is felsite, and No. 3 appears to be a much decomposed and mineralized granitic rock. The second package, consisting of eight specimens, was determined as follows: Nos. 1 and 2 are aplite, a variety of fine-grained micaless granite. No. 3 is syenite and similar to No. 1 of the first series. No. 4 is similar to No. 3, though finer grained and darker in color. No. 5 belongs to the same series as Nos. 3 and 4, but contains less quartz and the feldspars are more altered. The hornblende is comparatively fresh, showing only occasional signs of alteration. No. 6, while at a glance resembling Nos. 3, 4 and 5, contains little or no hornblende and is nearer a normal granite-quartz, feldspar and biotite. In all of these rocks the feldspar is more abundant than the quartz. No. 7 is of similar character to Nos. 3, 4, 5 and 6, but is more altered and is possibly near a vein, as it contains limonite crystals, pseudomorph after pyrite. No. 8 is probably a much altered diorite, in which the hornblende crystals have become decomposed and lined about the edges with crystals of magnetite. There is no rhyolite in any of the samples sent.

Molybdenum may be successfully concentrated, it is claimed, by the oil process.

The dark colored mineral in white quartz sent in a tin box from Randsburg is boulangerite (a combination of sulphur, lead and antimony).

The samples from North Yakima, Wash., are: No. 1, alum (sulphate of alumina); No. 2, arsenical iron; No. 4, silica, silicate of alumina, iron and sulphate of lime.

The rock specimens from Nevada City, Cal., marked J. H. R., are: No. 1, augite andesite, and is apparently from the wash of an ancient river channel; No. 2 is granite, but as the black mica (biotite) present is very limited in amount, the rock belongs to the type of granite known as aplite.

## How Far Can Power Be Transmitted Electrically?

How far can power be transmitted electrically?

What is the cost of transmitting electric power?

What per cent loss takes place in transmission?

These will be recognized by any electrical engineer as typical of the questions that are continually being asked by the investor in electrical enterprises, by the users of electrical power, and by the interested laymen in general, writes Paul M. Lincoln in Cassier's Magazine.

The crucial question in any commercial enterprise—and an electrical transmission scheme is always a commercial enterprise—is, will it pay? There is no real limit beyond which it is impossible to deliver electric power, provided no limit be put upon the amount of money to be spent. The engineer could easily be found who would undertake to deliver Niagara power in South Africa. The difficulty would be to find the financier to put up the necessary cash. The law of supply and demand operates no less in the realm of power transmission than in any other department of commercial enterprise.

If the price that could be demanded for power in South Africa were sufficient—say a million times its present cost—the idea of delivering Niagara power to that region would not seem the absurdity that it is under present conditions. In fact, there are in operation to-day dozens of transmission lines exceeding 3000 miles in length that have been for years transmitting power successfully, both from an engineering and from a financial standpoint.

The success of these enterprises is simply a question of the price which can be successfully demanded for the power delivered. In the case to which reference is made, this price is perhaps one billion times that for which Niagara power is sold in Buffalo, or say \$25,000,000,000 per K.W. per year. The writer refers to the transmission of energy in the Atlantic cables. The motion of the syphon recorder at the end of the cables is just as truly the result of power transmission as the running of a printing press or the driving of a factory. The same laws of transmission apply, whether the power transmitted be used for operating the syphon recorder or the factory. It is in the value of power transmitted that the great difference lies. If the power for driving factories were worth as much as that for operating a syphon recorder, Niagara power would, perhaps,

have been sold in the markets of Europe long before this.

The distance, therefore, to which power can be successfully transmitted by electricity depends almost entirely upon the price which can be successfully demanded for such power. The price is regulated by the law of supply and demand. The power user will buy power where he can get it cheapest and will install his own steam plant, unless the power transmission company can sell him power as cheaply as he can generate it. The most important single item in the cost of steam power is the cost of fuel. An electric transmission scheme which might fail utterly among the coal fields of a country, with coal at say \$1 a ton, might succeed brilliantly in places where coal costs \$10, or in South Africa, for example, with coal at say \$50 a ton.

### Equipment of the Fremont Mine, Amador County, Cal.

[FROM A SPECIAL STAFF CORRESPONDENT].

The mill of the Fremont Con. Mining Co., operating near Drytown, Amador county, Cal., is located midway between the two shafts, the Fremont shaft and the Gover shaft. Ore can be trammed from the rock breakers at either shaft over trestles to the mill.

The 40-stamp mill offers an example of recent California milling equipment and practice, and while in the main it differs but little from many similar installations, yet it contains a number of interesting details. Throughout its construction it has been designed so that renewals and repairs may be quickly and economically made.

Concrete is used for foundations and mortar blocks. The battery posts are set on cast iron sole plates. The frame is of the back-knee type, but contains no top bracing. One longitudinal tie-piece binds together the battery posts. A  $\frac{1}{2}$ -inch sheet of asbestos

bin being within the gallows-frame. Consequently, the vibrations of the rock breaker are not transmitted to the gallows-frame, and vice versa.

The old gallows-frame has been converted into a bin for the waste rock, the skips passing directly over it to the ore bins. The new equipment, designed for a depth of 3000 feet, straddles the old one. The small gallows-frame and hoist at the Gover shaft will prob-

Interior of the Fremont Gold Mill, Amador Co., Cal.

ably be similarly replaced in time. This shaft is now 1500 feet deep and connected with the Fremont underground.

The new change house is a model of its kind, containing separate booths for each man. It is equipped with shower baths and hot and cold water. It is particularly well heated, roomy and light.

The mine is not operating at present, owing to trouble with the miners' union, but expects to open up within a month with non-union men. Advantage has been taken of the shut-down to make repairs and improvements. The machinery has been overhauled, cottages have been built, etc. A cut or ditch is being dug to relieve the village of New Chicago from the

### Gold Milling.

Written for the MINING AND SCIENTIFIC PRESS by ALGERNON DEL MAR.

This most interesting subject is necessarily one of the utmost importance to every young man starting out on a mining career, as well as to others more in-

timately connected with mining interests, and to these I beg to dedicate the following notes. The majority of mining problems that will come before those just starting out will be problems requiring technical knowledge and a great amount of personal work, for these will be propositions where he will be "up against it" from the start. The treatment of low grade propositions will be his main work, and to efficiently cover this field all the various details of mining and milling should be followed most closely and wherever possible a saving made, however small. Mines should be mapped in regard to assays of the various blocks of ore, as well as the mill checked as to the quality of work being done. An even product should be fed to the mill, if possible, for better work can be done on such ore than where it is one day hard and poor and the next day soft and rich, or otherwise variable.

The mill work should be checked by assays before and after amalgamation, so that any loss, due to a variety of causes, may be rectified. The accounts at the mine and mill should be kept as in any commercial enterprise, and should be in such form as to be easily understood by a shareholder of ordinary intelligence, though he be unfamiliar with mining details.

Since stamp mills are still recognized as efficient pulverizers and amalgamators, my theme will be upon this variety of milling. The expense of running a 40-stamp mill is little more than running one of ten stamps, and the relative cost much less per ton. This applies equally to a 10-stamp and a 5-stamp mill.

The number of tons of ore crushed by a stamp mill is proportional to the amount of energy in foot pounds developed by the fall of the stamps, providing its discharging capacity is equal to or greater than the crushing capacity. As the stamp mill is used as an amalgamating machine, the crushing capacity should not be greater than its amalgamating ability, except where it is experimentally found advisable to crush a large tonnage with less saving than a small tonnage with higher saving in gold.

The amount of ore crushed by a battery depends upon the area and size of openings of the screen, the height of discharge and the number and character of the splashes produced by the fall of the stamp. The discharge can therefore be influenced to a limited extent by the speed and height of drop. With most ore to increase the amount crushed it is better to increase the weight of the stamps than the height of drop. This is being done generally in California, where it is common to have stamps of 1000 to 1150 pounds dropping at the rate of 100 to 105 per minute. The speed at which a stamp can drop is limited to the point at which the cam rising meets the tappet on the stem descending. This point should never be reached, or a broken cam will be the result. A safe margin should be left for accidents.

In Colorado, where the gold is finely disseminated in the ore, and where amalgamation largely takes place in the battery, the ore is kept a longer time in the battery. For this purpose the weight of the stamp is from 550 to 660 pounds, drop 16 inches, speed thirty drops per minute and discharge about

Head Frame, Fremont Mine, Amador Co., Cal.

Rope Driven Compressor, Fremont Mine, Amador Co., Cal.

is put between the heavy mortars and the concrete foundations. This sheet is intended simply to make a perfect joint. The mortar is secured by eight 2-inch bolts which are readily removable and may be replaced in five minutes. Vibration seems to have been reduced to a minimum.

The stamps weigh 900 pounds and have a 6-inch drop, with a speed of 104 to the minute. They are equipped with 10-inch shoes and dies. Iron guides are used. The stamps and concentrators are run by separate electric motors. Each 5-stamp battery is independent.

The mill is roomy and well lighted both by day and by night. Three enclosed arc lights give abundance of light at night. The concentrating equipment consists of eight Frue vanners and eight Woodbury tables.

The Fremont shaft was sunk to a depth of 1000 feet by a small prospecting hoist and gallows-frame. With the installation of the new 14x18 double-stem hoist made by the Fulton Iron Works, a new 95 foot head-frame and ore bin were put up. The gallows-frame and ore bin are on separate concrete foundations, extending down 28 feet to solid rock, the ore

sands of the tailings. The mill will not start until after this is completed. Wales Palmer is superintendent and Arthur Goodall manager at the mine.

The mother lode of California extends from the southern part of Mariposa county, in that State, to the north central part of El Dorado county. The veins of this mineral belt are of three distinct types—those associated with great masses of dolomite (sometimes ankerite), with walls of black slate and serpentine and in some cases greenstone (amphibolite) schist, like those at Placerville, El Dorado county, and those of Coulterville, Mariposa county; a second type, wherein the veins occur associated with amphibolite schist and black clay slate, a class found in central Amador county; and a third class in which the veins occur wholly in amphibolite schist, as those at Angels in Calaveras county. Rock formations are found in other parts of California essentially similar to those of the auriferous belt known as the mother lode, but these occurrences have no connection geologically with that lode, though sometimes this mistake is made.

13 inches, while in California the usual weight is from 850 to 1050, speed 95 and over, drop 6 to 8 inches and discharge 4 to 6 inches. The height of discharge, or the vertical distance between the top of die and lower edge of screen opening is a most important factor in gold milling. It determines the length of time a given particle of ore should be held in the mortar subject to amalgamation and to the disintegrating power of the stamps, and therefore is as important a factor on the ultimate size of the issuing pulp as the mesh of the screen. There is a point at which a certain height of discharge will be the most efficient and as near as possible to this point it should be kept as the dies wear down. This can be done by chuck blocks of different sizes, strips of wood on screen frame, having top and bottom of screen frame of different widths and reversing, by raising the chuck block by means of strips between it and the mortar or by putting iron plates under the dies as they wear down.

The material of which screens are made is a matter of individual preference, but the mesh should be a question of experiment. Some use brass wire; others Russia iron, angle slot or perforated; others burnt tin, while others use steel wire screens. This last class of screen I have found efficient and durable, giving a maximum discharge surface and outlasting Russia iron on the same ore. I can imagine cases where the ore containing copper sulphate might quickly destroy a steel screen. This emphasizes the fact that each individual ore must be treated on its own merits, and what would do well on one ore would be a disastrous failure on another. Burnt tin screens last a little longer and in some places will cost less than wire screens. The decreased discharging capacity, compared with wire screens, is a serious consideration. Slot screens generally give a coarser product than the number would indicate, while needle point perforated give a finer pulp.

The particular mesh to be used is the mesh that will give the least value in the tailings and the maximum output. There may be cases where the latter consideration overbalances the former; but the ore in sight or blocked out in the mine must be considerable to warrant this policy. The size of mesh will also be governed by the after treatment of the tailings. For example, an ore that is discharged through a 50-mesh screen, with tailings having values sufficiently high to cyanide, might be more economically worked with a 30-mesh screen. I have a case in mind where the result of a change of screen from 50-mesh to 30-mesh not only gave a more suitable cyanide product, but actually reduced the values in the tailings about one-third. The mill had been sliming not only the quartz, but the gold also.

The screen frame is inclined outward at an angle of 10°, to facilitate the discharge, and may have from 3½ to 4 square feet of screening surface. As the lower 5 or 6 inches does most of the screening, the screen frame can be made sufficiently narrow, so as to leave a space between it and the top of mortar screen opening for a hand hole through which to clean the screen of chips without taking off the screen frame.

The five factors—weight of stamp, height of drop, number of drops per minute, character of screen and height of discharge—should be so co-related as to produce the best results on the ore under treatment. The weight of stamp, being generally nearly 1000 pounds and wearing down as milling proceeds, is independent of the operator; but the other five can be regulated at will. Having had no previous experience with a battery, it was best to keep the drop below 7 inches, for, with a heavy stamp, the higher the drop the more liability of a broken stem. With new shoes, 5½ inches is sufficient drop to start on for most ores.

It will be seen that the stamp mill is not the rough machine that many imagine, but a machine that needs intelligent and constant care.

The ore coming into a well designed mill will be immediately dumped upon the grizzlies (grates) to separate the fines, or that portion not requiring further crushing before being fed to the stamps, from that portion to be broken by the rock breaker. The ore should travel of its own gravity from step to step of the operation and the mill building be large enough to eliminate overcrowding.

Where steam is employed for power the boilers should be blown off once a day and the water-gauge cocks opened at least every other shift, so as to be sure that the passages are not choked. The engine should be in a dust-tight housing or room, and will then require little more attention than regular oiling.

In a small mill it is generally economy to have the rock breaker of a greater capacity than that actually needed, for it not only allows the breaker man time for other work, but is on hand if the capacity of the mill is increased, and, if large enough, all the ore for the twenty-four hours' run may be broken during the day shift. A 40-stamp mill is generally provided with two grizzlies, each with a rock breaker at its lower end. The bars are generally of wrought iron, set parallel and covering a space 4 feet wide and 12 feet long. The bars are usually 1 inch wide, set from 1½ to 2½ inches apart and held in place by four or five rods passing through them horizontally, with ferrules between the bars. The bars should be wider on the top side than the bottom, so that all rock passing

through the top will go through and not choke the grizzly. They are set at an angle of about 40°. The grates last three or four years and may be protected to a great extent by having the upper end covered with an iron plate, on which the ore is dumped. Old wrought iron rails may be used, but do not last so long. Some mill men set the grizzly bars wider apart at the bottom than at the top to prevent clogging by large pieces of ore.

The ore passing through the grates goes to the bins ready to be fed to the stamps, while that passing over the grates may go to a bin over the mouth of the crusher or falls to the crusher floor to be broken and fed by hand. The ore from the crusher joins the fines in the bin below and is ready to go to the self-feeders. Some bins have flat floors, instead of inclined. The space in this case may be occupied by a reserve pile of ore, which can always be used if for some reason the supply of ore is stopped for a time. This practice is not advisable on low-grade ore, as it costs from 15 cents to 20 cents per ton to shovel the ore to the feeders.

A long experience in milling operations has demonstrated the advisability of having the rock breakers set at the mine or at some point intermediate between the mine and mill. This relieves the mill building of the heavy vibration incident to the operation of crushers and also admits of delivering to the ore bins back of the feeders a more uniform character of rock, instead of the greater part of the fines in one place and coarse rock in another.

If the ore were delivered to the stamps in a finer state of subdivision there would not only be a greater equality in the feeding, less wear on screens and on shoes and dies, and less wear on the guides, but an increased efficiency of the stamps. A trommel and a pair of crushing rolls may sometimes be advantageously employed, or a rock breaker of great capacity and set to, say, half an inch, following the ordinary rock breakers. The increased complexity of machinery is the main objection to this method; but where the coarse crushing is done away from the mill there is no reason why this should not be done.

The ore from the bins runs into the hopper of the automatic feeders. This is regulated to feed "low," so that the shoe and die shall almost, but not quite, come in contact when dropping on ore. The feeders, although practically automatic, require more or less attention by the mill man, particularly in mills that treat ores that are not well mixed. If the feed is regulated by a collar on the stem striking an arm, one of the latter should always be ready to replace a broken one. This applies also to other wearing parts of the self-feeder.

The duty of a stamp, or the number of tons crushed per twenty-four hours, will vary from 1½ to 4 or 5 tons, according to the physical character of the ore and its susceptibility to amalgamation.

The best material for shoes and dies is often a local consideration depending upon the proximity of foundries. As a general rule, steel shoes are more economical than cast iron. The time taken to change shoes when worn out is a consideration in favor of the most durable material. Dies are made of various materials, such as chrome steel, forged or hammered steel, or cast iron. The material of which the die is made should be a little less tough and hard than the shoe, so as to give the die a chance to wear in preference to the shoe. This will lessen "cupping"—the cup-shaped depressions often noticed in the dies.

In one instance steel shoes weighing 200 pounds lasted 140 days, crushing 350 tons of ore; the dies weighed 80 pounds and lasted 82 days.

The amount of water used for milling varies from five to seven gallons per stamp per minute for all purposes except water power. Where water is scarce and a tailing pond is used to settle and pump back from, and the engine steam condensed, about one gallon per stamp per minute will suffice for boiler, stamps and concentrators, depending, of course, upon the character of the ore. The above applies to medium hard quartz; but if the ore be soft and clayey, producing much slimes, then at least 1½ gallon per stamp per minute. When the machinery is run by distillate or oil engines and the tailings are settled in tanks, 100 to 110 gallons per ton of ore crushed has been found sufficient.

The scroll or order of drop for the battery is generally 1, 4, 2, 3, 5; 1, 4, 2, 5, 3, or 1, 5, 2, 4, 3. With the first scroll No. 5 must be given a longer drop than the other stamp, for the action of 2, 3 dropping in succession tends to pile the material up in the end of mortar under 5. The last scroll—1, 5, 2, 4, 3—gives a good regular wave in the mortar and an even discharge on the plates. The regular equality of the wave prevents choking on one side, which would inevitably occur if allowed to drop in regular succession. To prevent the ore piling up at the ends, No. 1 and No. 5 are often kept heavier or given a higher drop than the other three. The speed at which the stamps drop will have an influence on which scroll is to be preferred, for this speed will determine the splashes and the time that the next dropping stamp meets the wave produced by this splash.

The width of the mortar at discharge is from 17 to 19 inches for the new type of narrow-discharge mortars. The object is not to keep the ore in the mortar any longer than necessary to crush it to the desired mesh.

(TO BE CONTINUED.)

## The Ore Deposits of Bisbee, Arizona.\*

Written by F. L. RANSOME.

The Bisbee quadrangle owes its economic importance exclusively to the occurrence of ores of copper. The unimportant deposit of lead carbonate in Hendricks gulch, which was the first discovery in the district, is still being worked in a small way, and the Easter Sunday mine has supplied a siliceous gold ore used in the Copper Queen smelter for converter lining. But these, so far as known, are the only instances in the quadrangle of ores commercially exploited for other metals than copper. In comparison with the copper deposits, the known occurrences of other ores are economically insignificant.

For a district that has produced nearly 400,000,000 pounds of copper the Bisbee quadrangle, in spite of the general bareness of its rocky slopes, exhibits little patent evidence of its mineral wealth. The porphyry mass of Sacramento hill, and the schists that partly inclose it southeast of Bisbee, show considerable alteration and contain abundant disseminated pyrite, which by oxidation imparts a rusty stain to the rocks. But so far as known no deposits of value occur wholly within these discolored rocks. Some dark rusty masses, composed principally of limonite, outcrop along the Dividend fault in Bisbee. Similar ferruginous ledges occur in Hendricks gulch, on Queen hill, and in the limestones south of Bisbee. Experience has shown that such limonitic croppings, although rarely containing appreciable quantities of copper-bearing minerals, are nevertheless frequently, although not invariably, associated with an underlying ore body. They mark loci of fracturing and mineralization in the limestone. They evidently result from the oxidation of pyrite, the less soluble iron oxide and some silica remaining near the surface, while such copper as was originally present has been carried down by percolating solutions and redeposited at lower levels. These bodies of limonite, when not too siliceous, are the best surface indications of ore that the district affords. Many of the most important ore bodies, on the other hand, would have remained undiscovered were superficial phenomena alone relied upon to suggest exploration.

Although the rocks of the quadrangle are seamed with faults and dikes, none of the workable ore deposits occur as lodes or fissure veins. With a few exceptions they are irregular replacements of limestone. Originally pyritic, containing probably subordinate amounts of chalcopryite, they owe their present value to secondary concentrations effected by processes of sulphide enrichment and oxidation.

**DISTRIBUTION OF THE ORES.**—The principal bodies of copper ore thus far exploited in the quadrangle are contained within an irregular area of approximately a quarter of a square mile in extent. This area begins on the north in the heart of the town of Bisbee and extends south for three-quarters of a mile. It lies west and northwest of Sacramento hill, and for the most part between the Czar and Calumet & Arizona (Irish Mag) shafts.

Outside of this limited area no large bodies of copper ore have yet been discovered, although more or less ore is known to occur in the Lowell, Uncle Sam, Whitetail, Wade Hampton and other mines and prospects. The extent to which future development in these outlying properties is likely to increase the known area of important production will be discussed in another place.

**UNDERGROUND DEVELOPMENT.**—The Bisbee quadrangle contains two large productive mines—the Copper Queen and the Calumet & Arizona. In addition to these are a few undeveloped mines that have produced comparatively small quantities of ore, and a number of prospects ranging from shallow pits to shafts several hundred feet deep connected with extensive systems of drifts.

**COPPER QUEEN MINE.**—This comprises a maze of workings connecting with the surface through four working shafts and several other less-used openings. The area more or less thoroughly intersected by drifts and crosscuts covers nearly half a square mile, while the extreme vertical range of underground exploration is about 950 feet. They are practically all Carboniferous limestone.

The ore at the only point where it was exposed at the surface was first worked by an open cut, which still yawns upon the hillside just above the Copper Queen store. With the need for deeper development the Queen incline was sunk just east of the open cut. From this incline, which reached a vertical depth of 280 feet, four levels were run, known as A level, B level, 300-Queen level and 400-Queen level. With the exception of the lowest level, a very small part of these old workings is now accessible.

As work proceeded and successive ore bodies were discovered to the southeast, vertical shafts were put down and levels run approximately 100 feet apart. The first of these shafts is the Czar, 440 feet deep, situated on the southwest edge of the town of Bisbee. The Czar levels are four in number, the second level, corresponding to the old 400-Queen level, being the

\* Abstract Professional Paper No. 21, U. S. G. S.

most extensive. Large bodies of ore have been stoped southwest of the Czar shaft. All of the important ore bodies so far discovered west of a meridian drawn through the Czar shaft have been above the third level.

**CALUMET & ARIZONA MINE.**—This mine, the underground development of which is chiefly within the bounds of the Irish Mag claim, is operated through the Irish Mag shaft, situated 900 feet south-southeast of the Spray shaft and about three-quarters of a mile in the same direction from Bisbee.

The Irish Mag shaft, begun November, 1900, was about 1200 feet deep at the time of visit. It was connected with four levels, run at depths of 750, 850, 950 and 1050 feet below the surface, and a station was then being cut for the 1150 level.

For 750 feet the shaft was carried down, without drifting, through barren limestone. At this level some exploratory drifts were run and connection made with the air shaft near the northeast end of the Irish Mag claim. Very little ore was encountered, however, until the 850-foot level was reached. This level is about 30 feet lower than the sixth level of the Spray, with which there is connection through a raise in the northern corner of the Irish Mag claim. On the 850, 950 and 1050-foot levels large bodies of ore were discovered and partially blocked out before active stoping was begun in November, 1902.

The ore from the Calumet & Arizona mine is all hoisted through the Mag shaft and carried in steel cars to the company's smelter near Douglas. By the end of 1902 this plant was turning out about thirty tons of copper per day, with a single furnace running on ore with an average tenor of about 10%.

**LOWELL MINE.**—This property, purchased for \$500,000 by the Copper Queen Co. in June, 1901, is situated a little over a mile south-southeast of Bisbee. It is worked through a vertical shaft about 1120 feet in depth. There are nine main levels consisting chiefly of drifts from the shaft, and numerous crosscuts. The workings are probably entirely within Naco limestone, which is cut by some small dikes of granite-porphry. The drifts in general follow the strike of the easterly dipping beds, which are disturbed by slips along the bedding planes and by strike faults.

No important ore bodies have been encountered in the Lowell above the 900-foot level. Ore occurs, however, on the 1000-foot and 1100-foot levels, but has not yet been developed by stoping.

At the time of visit the mine was making about 175,000 gallons of water a day, mostly from the 1100-foot level.

**COPPER KING MINE.**—This is an abandoned prospect situated a little over half a mile southeast of Bisbee. The workings comprise a vertical shaft, supposed to be about 700 feet deep, and some short drifts. The dump consists of hard, light-gray quartzose material heavily impregnated with pyrite. The microscope shows that this material is composed chiefly of quartz in irregularly interlocking grains, with considerable sericite, pyrite, and a little zircon and rutile. It is a highly altered rock and, so far as revealed by its lithological character, may have been originally either schist or porphyry. As the shaft is sunk in the center of the area of intrusive rock, the material is probably altered and mineralized porphyry.

**CALUMET & PITTSBURG MINE.**—This property is about  $\frac{1}{4}$  mile southeast of Bisbee, near the road to Naco. At the time of visit it comprised a well-equipped vertical shaft 950 feet in depth. No drifting had yet been undertaken and no ore encountered. The shaft is entirely in solid Naco limestone. There are no superficial indications of ore and the shaft has been sunk with the expectation of finding in depth a continuation of the ore-bearing ground that has proved so profitable in the Copper Queen mine.

**LAKE SUPERIOR & PITTSBURG MINE.**—This mine, still in the prospecting stage, comprises two unconnected sets of workings, from shafts half a mile apart.

**WHITETAIL MINE.**—The Whitetail (or Whitetail Deer) mine lies about  $\frac{1}{4}$  mile south of Bisbee, on the northern edge of Espinal plain. It has produced a few hundred tons of good copper ore from primitive and shallow workings on the contact between Abrigo and Martin limestones. The mine has been idle for years, but as it has recently been acquired by the Copper Queen Co. it is likely to be systematically explored in the near future.

**UNCLE SAM MINE.**—This mine—situated in the gulch of the same name—lies five-eighths mile southwest of Bisbee. The developments comprise a tunnel and a shaft, but as no work has been done for several years both were inaccessible at the time of visit. The dump of the tunnel shows evidence of considerable mineralization, and the mine is said to have produced a little good copper ore.

Bisbee West mine is a prospect 2 miles southwest of Bisbee. A vertical shaft about 700 feet deep has been sunk close to the junction of the Bisbee fault with a short northeast fault. The shaft was partly filled with water at the time of visit, and none of the levels could be examined.

Easter Sunday mine is 5 miles east from Bisbee on the south side of Mule gulch. It has been worked on a small scale and in a primitive manner. The developments comprise a tunnel a few hundred feet in

length run into a steep northern hill slope, and a series of irregular stopes and raises extending up to the surface. The mine is unique in this district, inasmuch as it produces a free-gold ore. The gold occurs rather irregularly in a fractured quartzitic bed of the Morita formation. The best ore is said to run as high as \$30 per ton. But as such ore contains considerable calcite, and as the Copper Queen Co., which has been utilizing the ore as a siliceous lining for its converters, requires that the silica shall not fall below 84%, the ore actually hauled to the smelter is purposely allowed to contain more or less quartzitic waste.

Glance mine is a prospect 8 miles southeast of Bisbee, near Glance station, on the El Paso & Southwestern Railroad. It has a vertical shaft 505 feet in depth in Glance conglomerate. At the date of writing the shaft had just penetrated this conglomerate and reached the underlying limestone, but encountered at the contact so strong a flow of water that sinking had to be temporarily abandoned. A drift has been run for 120 feet to the southwest, just above the water level, cutting through a dike of monzonite-porphry about 13 feet thick. According to a letter from S. W. Clawson, portions of the dike carry 3% copper.

The Modern mine is a prospect just outside of the northern boundary of the quadrangle on the northeast side of the Tombstone canyon, and is in Pinal schist. The developments comprise a vertical shaft 200 feet in depth and two short drifts. Two narrow veins are encountered, one in the schist and the other between the schist and a dike of granite-porphry. They are nearly vertical and their general strike is from  $10^{\circ}$  to  $30^{\circ}$  east of north. The maximum width of the vein is 18 inches and they contain cupiferous pyrite, with a little galena and sphalerite, in a gangue of quartz. The presence of native copper and cuprite was reported by those in charge of the work, and the ore was said to carry as much as an ounce of gold, but there was no opportunity of confirming these statements. The schists in the vicinity of the shaft show considerable fissuring and are traversed by narrow anastomosing dikes of granite-porphry and by veins of quartz.

(TO BE CONTINUED.)

### Follow the Crevice.

TO THE EDITOR:—In presenting this brief article it should be stated at the outset that the writer is not opposed to the perpendicular shaft, as such, but solely for economical reasons in the class of instances hereinafter referred to. He is fully aware, from personal experience, that a perpendicular shaft is very often a necessity and an economy, especially where a mine has developed a large amount of ore, and the vein dips at a large angle from the vertical. Yet he can recall instances where financial ruin has come to an otherwise paying mine as a result of the ambitious plans of the management to abandon the old workings and sink a new, up-to-date perpendicular shaft. However, such matters should be considered from the economical standpoint alone, always allowing for the element of safety.

Recently while spending some time in one of the newest mining camps of Colorado, the writer had his attention called to the particular manner of carrying on mining operations. The deepest shaft had attained over 600 feet on the dip of the vein. Three others ranged between 300 and 400 feet, vertical, while four or five more were down over 100 feet, also perpendicular. Thus, only one out of eight or nine had followed the vein.

Now this idea of the perpendicular shaft appears simply as a matter of custom, for very many of the prospectors are directly from the Leadville district or its vicinity. The contacts and blanket formations of the Carbonate camp present peculiar economic reasons for carrying a vertical shaft, as it is the cheapest and quickest method of reaching the ore deposits. But in the new camp referred to conditions are entirely different.

The veins are fissures in the granite and seldom have a greater dip than  $10^{\circ}$  or  $15^{\circ}$  from the vertical. Furthermore the crevice matter is loose and soft and in many instances is picking ground throughout, shading off into very hard granite walls. It has been found by comparison that the cost of sinking the perpendicular shaft in the solid granite is even treble the cost of the shaft on the vein. In addition must be added the cost of crosscutting at the several stations to reach the vein. Then aside from primary expense is the ever-present possibility that a good pocket of ore may be missed between the levels, which otherwise would have been opened by the shaft, but is left for some lucky leaser of the distant future.

In speaking of these points the superintendent of the 600-foot shaft, which is on the dip of the vein, stated that he opened very little pay until near the 400-foot point. He said further that had his company expended their money in a perpendicular shaft and crosscuts, in the hard, tough granite, no doubt they would have become discouraged and another failure went on record, while, as it is, this proposition is paying dividends.

The idea may justly find support in a highly miner-

alized section where the veins and crevices are very numerous, or where it is the most economical way of reaching the deposits of ore between flat formations, but not in the average new mining camp. As a rule, the prospector for precious metals, or their ores, has a limited amount of capital with which to reach his goal, and cannot afford to waste time and money in blasting hard granite, when a pick and shovel are about all that is necessary in following the crevice.

Black Hawk, Colo., July 6.

W. G. ADAMS.

### Belt Power Hammer.

Herewith is illustrated a new belt power hammer, known as the "Denver," designed and being patented by George Bignell of Denver, Colo. This hammer is intended for general blacksmith use and ranges from  $\frac{1}{2}$  inch to  $3\frac{1}{2}$  inches round or square and up to 6x1 inches. Attachments can be supplied upon order to enable a blacksmith to weld rings from 8 inches to 3 feet in diameter. Dies are furnished for spreading and shanking drill bits of all sizes. The manufacturers claim with this machine a blacksmith and helper can spread and shank from sixty to eighty drills per hour. It is made in three sizes and in two styles.

Belt Power Hammer.

No. 1, shown herewith, is a post hammer bolted to 12x12-inch post and weighs 900 pounds. No. 2 is self-contained with cast-iron frame and weighs complete 1600 pounds. No. 3 is the same style as No. 2, but of lighter pattern, and weighs 1100 pounds. No. 4 is parts of No. 3 bolted on 8x8-inch post; weight, 650 pounds. The heaviest piece is the anvil block of No. 1, which weighs 250 pounds and can be transported on mule back. No. 1 and No. 2 have 14-inch stroke. Weight of crosshead and die is sixty-five pounds, with 350 to 400 revolutions per minute. The hammer is now being manufactured and placed on the market by the Denver Power Hammer Co., 1433 Broadway, Denver, Colo.

### Chlorine Produced Electrolytically.

The large electrolytic plant of the United States Reduction & Refining Co. at Colorado City is among the most interesting metallurgical works in America. In these works, illustrations of which appear on the front page, a concentrated solution of sodium chloride is electrolyzed, the result being the production of chlorine gas and caustic soda. The chlorine gas is absorbed by water and the liquor used in the treatment of gold ores by chlorination process. The caustic soda is employed in another portion of the works. The management states that the production of chlorine gas by means of the electrolytic decomposition of a solution of sodium chloride is much less expensive than the generating of chlorine gas by the action of sulphuric acid upon bleaching powder (chloride of lime). The electrolytic method of generating chlorine gas would be of undoubted advantage at points where transportation charges are high, but where salt is sometimes comparatively cheap, being found in the dry lake beds. These conditions are not infrequently found in desert regions. J. D. Hawkins is general superintendent of the United States Reduction & Refining Co.

## Mining and Ore Treatment in Western Australia.\*

Written by DONALD CLARK.

So far as mining is concerned, Western Australia was certainly the Cinderella of the States. Queensland, with its Charters Towers, Gympie and Mount Morgan; New South Wales, with its extensive coal measures and Broken Hill; South Australia, with its Moonta and Burra Burra; Tasmania, with its Tasmania, Mount Bischoff and Mount Lyell; Victoria, with its £260,000,000 worth of gold; were apt to look upon their western sister with a tolerant, patronizing air. Now she has outstripped all her sister States, and shown how one small field such as Kalgoorlie can turn out as much gold as the whole of the fields in any State. The area of Western Australia is 975,920 square miles, its greatest length from north to south being 1400 miles, and from east to west 1000 miles. The southern and southwestern areas are fringed with coastal limestones from Eocene age to the recent calcareous sands around Perth and Fremantle.

Carboniferous and Mesozoic rocks occur over large areas; Cambrian rocks have been identified in the Kimberley district, while the Archaean rocks, comprising gneiss, granite and schist, are said to be more extensive than in any other portion of the world. These Archaean rocks are important, in that the valuable metallic deposits occur in them. Mr. Woodward considers there are six distinct belts running north and dipping slightly eastward. The first belt runs nearly parallel to the western coast and contains lead, copper and zinc. The second belt contains the Greenbushes tin fields and fine deposits of graphite.

The third belt lies about 100 miles inland from the coast, and is about 100 miles wide. This belt contains bold, bare outcrops of granite, which are flanked round with sand. Rain runs off as from the roof of a house. This water finds its way through the sand to be entrapped in hollows, giving rise to soaks and gnammas holes. Drains are now made circumscribing these outcrops, and the water led into excavated dams.

The fourth, or first auriferous belt, lies east of the granite belt. It is about 20 miles in width. Starting from Phillip's river, it includes Parker's Range, Southern Cross, Golden Valley, Mount Magnet, Cue, and Nannine. The fifth belt resembles the third; that is, it is made up of granites and other igneous rocks. This divides the Southern Cross auriferous belt from the sixth belt, whose width has not been determined. The sixth belt starts from the Dundas hills, and includes the famous fields of Coolgardie and Kalgoorlie, and extends right through to Marble Bar and Mulline on the northwest coast. The area of the present goldfields may be conceived when it is remembered that each of these belts is over 800 miles in length.

In 1861 a prospector found auriferous stone 30 miles east of Northam, but could never rediscover the place. In 1862 the Government engaged E. H. Hargraves, the discoverer of gold in New South Wales in 1851, to prospect and inspect the country for gold. Mr. Hargraves' opinion as published, "The Non-Auriferous Character of the Rocks of Western Australia," shows how the practical man will theorize, even to his own undoing. In 1864, C. C. Hunt headed parties which penetrated the country to the Dundas hills, Lake Lefroy, and probably passed over the Coolgardie goldfields. They named the "Hampton Plains" after the Governor of the day, but only looked upon the country from a pastoral point of view. In 1869 the Government offered a reward of £5000 for the discovery of a goldfield within 300 miles from any port, to be paid after 5000 ounces had been won; a still more progressive step was taken in 1873, when sixteen Ballarat miners were imported to prospect and mine for precious metals. A battery was erected at Fremantle. This venture ended in failure. In 1885 the Kimberley goldfield was opened up, and in the following year 2000 men had been attracted to the place. This marks the first successful move which has resulted in the modern discoveries. Prospectors again set eastward from Northam, and after many small finds Southern Cross was discovered in 1887. From that time for a number of years new fields were proclaimed with feverish haste—Pilbarra, Ashburton, Murchison, Cue, Siberia, were all discovered before 1891. In April, 1892, Bayley and Ford started eastward over that desolate, dreary strip which lies to the east of Southern Cross. After having been beaten back for want of water they slightly changed their course, and arrived at the native well—Coolgardie—where they camped. During the next three days they picked up 200 ounces of alluvial gold. Returning to Southern Cross for provisions they hurried back to the scene of their find, and on the day they reached Coolgardie for the second time discovered the famous Bayley's Reward mine. The first afternoon's work gave them 500 ounces in specimens. Bayley returned and showed 554 ounces to Warden Finnerty on the 17th of September, and obtained a lease of his discovery claim. The gold fever seized

the local inhabitants, and in less than a week hundreds were on the way to the latest land of promise.

Kalgoorlie was discovered in June, 1893. During the next three years Bulong (I. O. U.), the London-derry, the Wealth of Nations, Menzies, the Norseman, and other goldfields were discovered.

The difficulties the early prospectors had to contend with can never be properly understood by those who have not faced them. The country from Northam to the goldfields is so flat that for hundreds of miles there is neither cutting, embankment nor bridge. A few culverts are constructed where water might run. Isolated bare granite outcrops, or low rugged ridges capped with ironstone are dignified with the name of mountains. The country, however, is not bare, but sparsely covered with stunted gums about 50 feet in height, with a scaly butt and bare white or red stems; a thin cluster of pendant leaves is borne on the summit of umbrella-shaped branches. Mulga, quandongs, cotton bush and salt bush hide the bareness of the parched red soil, while on the sand ridges the globular tufts of the bright-green spinifex shows in marked contrast against the blue of the short scrub and the green of the scraggy gums. Great flat plains, covered in some instances with sand, in others with a stunted scrub, are known as lakes. The water, it is explained, is underneath the surface. The soil appears to be fertile, but is redeemed from being a desert by the scrub, which extends over hundreds of miles. As soon as settlement destroys vegetation the fine red sand which floats with every breeze envelopes and tinges all natural and artificial objects with a color peculiar to itself.

The climate of the southern and southwestern coastal districts is said to be the most salubrious in the world; most people would not say the same about the goldfields towns. The average mean maximum day temperature for January is very nearly 100° for the Coolgardie goldfields, while the Murchison is 105°. The nights are said to be cool, but this is only relative to the day temperature.

There is little doubt, had the eastern goldfields a rainfall like that of the coastal districts, the topographical features of the country would have been greatly different. Deep channels would have been cut and watersheds would have been clearly marked. The rainfall is from about 6 to 9 inches per annum; this limited supply has little or no geological effect in removing material and eroding channels. In more ways than one such a meager rainfall is of advantage in a country where the water lies, and where a down-pour of a few inches would mean flooding the country and converting the roads in the red soil into clay quagmires. Semi-tropical conditions would be much more trying than the clear, dry heat which now prevails.

There are many public condensing works on the fields, and special condensers have been evolved to suit local conditions. Many elaborate methods were tried, but a very simple form is almost universally adopted.

Five cubical 400-gallon tanks 4 feet by 4 feet by 4 feet are set on edge, so that they form a diamond-shaped boiler 20 feet in length. A similar row is set parallel to these with middle edges adjoining. These are built in. A fireplace is placed in front between the series, and flues are so arranged that the heated air circulates round the tanks and returns to a chimney alongside the fireplace. The tanks are connected below, while above they lead to a common pipe through which the steam passes. This pipe leads to a closed jacket which surrounds a galvanized iron tank, the tank itself being full of the salt water, which has to be condensed. A portion of the steam is condensed and drains away to a reservoir. The water in the tank becomes raised to near its boiling point by its contact with the steam, and runs continuously into the first tanks, or those on each side of the fireplace. The salts in the water, which soon deposit, are blown out at the opposite end from time to time.

The vapor which passes the first cooler goes through a series of inclined or vertical galvanized iron hollow cylinders about 4 feet in diameter and 20 feet in length. These have open pipes running through them. Each of the cylinders condenses some of the vapor which is drained away, and the number can be so arranged that very little escapes. These rows of columns, so common on the goldfields, are atmospheric condensers. Joints are made tight with a little paste. In some cases, in order to facilitate cleaning out, each tank is divided so that the upper half forms a cover resting in a water seal. The top can thus be lifted bodily with block and tackle, and scale or salt removed from the lower portion.

Before the completion of the pipe line from the Helena river the cost of distilling with wood at 15s per ton, or green wood from 24s to 25s per cord, was about 1d per gallon, or 4s 6d per 100 gallons.

The water from the shafts adjoining the mines—for the gold mines themselves may be said to be dry—contains from 6% to 19% solids, that from the Great Boulder mine giving sodium chloride 11.164, magnesium chloride 1.425, calcium sulphate .462, lime .422, a total of 13.473.

The salt water at the mines is a highly objectionable material, loaded as it is with solids. It has to be used over and over again, until it is so saturated that even a small amount of evaporation or change of temperature will cause it to deposit its

salts all over the place; every leak or drip of water about the works is indicated by long pencil-like stalactites, while the pipes and launders choked and filled with large and often perfectly formed crystals of gypsum (selenite) and even the grinding pans and settlers become coated with a thick incrustation of the same substance. When the water becomes alkaline through lime being added, a white inflorescence of magnesium hydroxide separates out; this covers the filter presses with a snow-like deposit.

Fuel is much higher than in other States. The wood used as a rule is so free-burning that it is like feeding a fire with paper. The country has been devastated of large timber for miles around, and though branch timber lines are pushed farther and farther back, it is likely that the price will reach that of coal conveyed on the railway from the local mines. The present cost of 15s per ton means about 20s when compared with the firewood we produce.

(TO BE CONTINUED.)

## Some Important Cripple Creek, Colorado, Mines.

Among the numerous productive mines of Cripple Creek, Colo., are those operated by the United Gold Mines Co., of Colorado Springs. Their holdings embrace a total of over 400 acres. Beside those portions of the property operated by the company there were, according to the last annual report of the company issued June 1st last, twenty-six blocks of ground being operated by leasers, these leases giving employment to 130 men. The various properties of the company consist of eleven separate groups of developed mines and claims in the prospective stage of development. One of the most prominent of these is the Wild Horse, in which the Wild Horse vein is the most developed. There are five working shafts, the deepest being 1280 feet. The main ore shoot is known to extend from the surface to a depth of 970 feet, below which depth the levels have not yet been extended to the shoot. The total production of the Wild Horse is stated to be \$2,072,580. The main vein occurs outside the volcanic vent in the granite, and is oxidized. The vein is irregular both as to size and values, though in depth the occurrence of rich pockets at intervals has raised the average grade of ore considerably. One of the accompanying engravings is that of the No. 1 shaft of the Wild Horse mine. Other veins in this group are opened by means of crosscuts run from the Wild Horse shaft. Some of the cross veins of this system contain high-grade ores. The Gleason shaft of this group is well equipped with machinery and it is calculated to eventually operate a large portion of the property through this shaft, after connection has been made with the Wild Horse vein workings. Near the Gleason shaft a cyanide mill of 100 tons daily capacity has recently been built in connection with a lease on the Wild Horse vein. Another of the engravings herewith shows the buildings about the Gleason shaft. It is a scene typical of the mining industry in Cripple Creek district. Among other properties of the company are: The Deadwood, which is credited with a production of over \$1,100,000. It has seven working shafts, the two deepest being 800 and 850 feet, respectively, with over 15,000 feet of levels opening eight separate veins, on an intricate vein system, a notable feature of which is the occurrence of large bodies of ore at the intersections of the several veins. The Damon, which has three shafts, the deepest being 450 feet deep. In this property also ore bodies of considerable size are found to occur at the intersection of the veins. Usually these veins are found in two systems, one nearly vertical, the other nearly flat. These veins are in the andesite breccia. The mine is being worked at present by leasers. It has an equipment for 1000 feet depth. The United Gold Mines Co. also controls the W. P. H. property, which is credited with an output of over \$420,000. It has four shafts, the deepest 450 feet. In the eastern end of this property the grade of ore is such that leasers willingly pay 30% gross royalty for the privilege of mining. The low-grade ore is stated to be amenable to cyanide treatment.

The Requa mine, with five shafts, the deepest 514 feet, has produced over \$110,000, with level workings and tunnels 5200 feet in length. Other properties of this company are the Bull Hill and Straub Mountain, the Pinnacle, the M. K. & T., the Panther, and the May Belle, each of which has shafts of variable depth, down to about 600 feet, beside extensive drifts, crosscuts, etc.

The total production of the United Mines Co.'s property is stated by their last annual report to have been \$4,268,000; the output since the mines were consolidated under this single management has been \$1,261,000, the production for the first five months of 1904 having been \$285,000. The several leases pay royalties ranging from 25% to 50% of the output.

As a general statement, it has been asserted that not over 20% of the productive area of the camp has been developed to a depth of 500 feet. This refers not alone to the properties above mentioned, but to the Cripple Creek district, and the outlook for many years of prosperous operation of the mines of the district is as promising as at any time in its history.

\*Abstract Australian Mining Standard.

Wild Horse Shaft of United Gold Mines Co., Cripple Creek, Colo.

Gleeson Shaft of United Gold Mines Co., Cripple Creek, Colo.

# Mining and Metallurgical Patents.

PATENTS ISSUED JULY 5, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ACTUATING MECHANISM FOR CONCENTRATING TABLES.—No. 763,785; G. A. Overstrom, Anaconda, Mont.

In actuating mechanism, combination with drive shaft having crank, pitman journaled at one end upon crank, connections between free end of pitman and part to be actuated, and rocker pivotally mounted and forming movable fulcrum for pitman at point between journal bearing and free end thereof.

ORE WASHER.—No. 764,448; F. H. Frankenberg, Pueblo, Colo.

Ore washing machine comprising tank, standards extending upward therefrom, water tank supported at upper ends of standards, water distributing pipes extended from tank downward at front and rear sides of standards, pipes having horizontally disposed sections provided with perforations, carrier chains supported by standards, and buckets mounted on chains, buckets being arranged in pairs of reverse order.

APPARATUS FOR REMOVING DIRT FROM EXCAVATIONS.—No. 764,201; W. J. Newman, Chicago, Ill.

Dumping apparatus comprising sloping track, upper part of which is horizontal, dumping car having traction wheels which travel on rails of track, guide hopper located below upper part of track, inclined deflector bars located laterally outside of track rails near upper end thereof, parts on sides of car adapted to engage deflector bars to tilt car when

latter reaches upper end of track, door for closing front end of car and attached to frame which is hinged to car and cable for drawing car from lower to upper end of track and attached to upper side of door, whereby pull of cable acts to hold door closed while car is traveling up inclined track, but pulls door open when car is brought to dumping position.

PROCESS OF SMELTING AND REDUCING METALS.—No. 764,044; C. Diesler, Coblenz, Germany.

Process of smelting and reducing metals, consisting in mixing materials to be treated with carbonate of lime and carbon, placing mixture in air tight retort, exhausting air from retort, subjecting mass to action of electric current within retort and to action of gas generated therein in excess of five atmospheres of such gas, and exhausting such resultant gas after it has acted on materials treated

AIR COMPRESSOR.—No. 764,182; C. J. Diedrich and A. F. Cramer, Detroit, Mich.

In compressor, combination with cylinder, of chamber exterior to and extending transversely across base of cylinder proper and containing converging valve seats forming between them tapering pocket leading to port through which chamber communicates with cylinder, spring-pressed suction valve in chamber at one of seats, and spring-pressed delivery valve in chamber at other of seats.

CONVERTER.—No. 764,332; Ralph Baggaley, Pittsburgh, Pa.

Converter having ventilated passages open to air at bottom, and other passages leading therefrom upward along shell, passages being constituted by pipes incased in bricks, tiles or metal blocks.

FILTERING PROCESS.—No. 764,486; G. Moore, Salt Lake City, Utah.

Process of filtering slimes, consisting in immersing filter in bath containing slimes and fluid in which they are suspended, forcing fluid through filter by difference of pressure between opposite sides thereof, whereby slimes are deposited thereon in layer of requisite character; removing filter from bath and cleaning it by air pressure applied to back thereof.

FASTENING DEVICE FOR IMPLEMENTS.—No. 764,283; C. Ehrenfeld, Pasadena, Cal.

Combination with implement head, provided with a socket adapted to receive handle, of handle therefor, jaws having projecting ends taking into head, shanks of jaws having tapered portions extending out on handle and provided at ends with means adapted to take into handle, and clamping ring adapted to spring over tapered portions of shanks to hold jaws in place.

APPARATUS FOR DISTILLING CRUDE OILS.—No. 764,138; J. C. Mallonee, Charlotte, N. C.

Apparatus for distilling products from crude oils, comprising in its construction still; means for heating still at bottom thereof; condensing and separating means; means for conducting products of distillation from still to condenser and separator; means for cooling heavier products of distillation to prevent them from passing to condenser and to be returned to still; second still; means for heating it and for conveying away therefrom products of distillation and separating same; means for conveying undistilled products from first still to second still; means for cooling and separating distillates of second still; fourth still; means for conveying thereto certain products of distillation of second still; third still; means for conveying thereto undistilled products of second and fourth stills; and means for separating and cooling distillates of second and fourth stills.

# Mining Summary.

SPECIALY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

The following figures for the copper production of the world for 1903, compared with 1902, are given by H. R. Morton & Co., London, Eng. The quantities are expressed in tons of 2,240 pounds:

	1902. Tons.	1903 Tons.
Africa:		
Cape Colony	1,150	5,230
Asia:		
Japan	29,775	31,360
Australasia	28,640	29,000
Europe:		
Austria	1,015	1,055
Hungary	485	330
England	480	500
Germany	21,605	21,205
Italy	3,350	3,100
Norway	1,585	5,915
Russia	8,575	10,320
Spain and Portugal	49,790	49,740
Sweden	455	455
Turkey	1,100	1,400
South America:		
Argentina	240	135
Bolivia	2,000	2,000
Chile	28,420	30,630
Peru	7,580	7,800
North America:		
Canada	17,485	19,320
Mexico	35,785	45,315
Newfoundland	2,400	2,080
United States	292,870	298,050
Totals	541,295	565,820

With other data concerning productions of the area included in the Louisiana Purchase issued by the Department of Commerce and Labor, Bureau of Statistics, the following on mineral wealth is given: The coal produced in this area in 1902 amounted to 30,000,000 tons, against 14,000,000 tons in 1890; the iron ore to 15,850,000 tons in 1902, against 1,269,000 tons in 1890; the silver product of 1902 to \$37,837,576 in coining value, against \$44,799,998 in 1890, and gold \$39,841,500 in 1902, against \$10,650,000 in 1890. The territory of the Louisiana Purchase embraces an area of 875,025 square miles.

## ALASKA.

E. H. Power, principal owner of the Rodman Bay mines, near Juneau, and G. E. Bent, manager, are preparing to make improvements necessary to put the property in working order. They are also interested in properties on Admiralty island. Development work will be increased.

H. H. Williams, manager of the Humboldt group, in Silverbow basin, near Juneau, says that in Berners Bay district the mining claims adjoining the Johnson property and belonging to the Gold King Co. of Portland, Or., of which Williams is president, are showing satisfactorily. A ledge was uncovered showing on the surface a width of 4 feet. The last 8 inches next to the hanging wall assayed \$200.

N. Macauley of Victoria, B. C., and J. A. Chapman reported having struck oil in a 9000-acre tract in the oil fields at Kayak. They have a four barrel a day gusher. This oil was struck at a depth of 1100 feet, though they had not expected oil until a few hundred feet deeper.

A dredger has been constructed and shipped to Haines by the Bachman Dredging Co. of Pasadena, Cal. The dredger will be used on Chilkat river. It is claimed that it solves the problem of bringing to the surface all granular material coming within reach of its suction pipes. All pockets or cavities holding precious metal will be emptied. Sand and gravel are removed by buckets. At any time, it is also said, a hydraulic giant can be attached to the discharge pipe for sluicing purposes.—It is reported that the Kensington group of mines, in the Berners Bay district, has been sold to the Alaska-Treadwell M. Co. for \$1,000,000.

Superintendent Hampton of the Juapla M. Co., operating near Juneau, has twenty men at work. Work has started on the flume, 7x20 feet, which will be used to handle the water of the creek.

A. Gfeller of the Helvetia G. M. & M. Co. and the Missouri M. Co. at Windham bay says the latter company has acquired a five-year lease on the property of the Little Basin M. Co. of Portland, Or. Experiments are being made to determine the proper working and ore treatment for these mines. It is intended to operate both properties through one plant as soon as opened up. Men are drifting on the Little Basin group.

The management of the Treadwell mines at Douglas are preparing to put in a compressor capable of running forty or fifty drills.

## ARIZONA.

### Gila County.

The production of the Old Dominion smelter at Globe for month of June is reported at 1,550,000 pounds of blister copper, a thirty days' run for two furnaces. At the new smelter the brick work on the dust chamber is completed. The blast

pipes are being put in place, and above the smelter the sills for the ore bins are being laid. Grading for the concentrator has been finished and the channels to carry off the tailings are being cut. Sinking of the main shaft below the tenth level is expected to proceed slowly until changes are made in the cages.

O. Gieseke, for New York and Montana men, has an option on the Stewart & Clark group of eighteen mining claims and seven other contiguous claims for \$150,000. This group of twenty-five claims is contiguous to the Old Dominion and United Globe properties, at Globe. On several of the claims considerable development work has been done.

### Mohave County.

(Special Correspondence).—With the reopening under bond by W. S. Fletcher, of the Star Spangled Banner, C. O. D. and Alpha groups of mines at Stockton Hill, that section of the Cerbat district is showing renewed activity. Stockton Hill, 10 miles northwest of Kingman, formerly produced large quantities of high grade ore, even when transportation was a heavier item of expense than at present; but for several years past little has been done toward developing the mines. The three groups mentioned are being worked under superintendence of P. Wiseman, with T. McMahon in charge of the C. O. D.; F. G. Holmes at the Alpha and C. Ogden at the Banner. The C. O. D. and Banner, employing 40 and 47 men, respectively, are sacking ore for shipment and will send about five carloads per day to the company's smelter at Needles, Cal., being fitted up by Manager Fletcher. These mines are on the eastern slope of Cerbat mountains, and the ore will be hauled to Kingman as the shipping point. The Alpha group is on the western slope above Todd Basin and adjoins the Night Hawk mines at Layne Springs. A few men are doing development work at the mine while a party of Indians are building a road to Mineral Station on the A. & U. Ry., the branch railroad running from Kingman to Chloride. By the time the road is completed it is expected that the Alpha will be opened up and capable of furnishing two carloads of ore per day.

A mile below the Alpha is the Oro-Plata mine, a section of which is under lease to F. O'Dea, who is opening up an ore shoot 90 feet deep by 180 feet long and preparing for stoping. This ore carries four ounces gold per ton. Most ores of the district are silver-lead. Of the latter class is the Paymaster mine near the Oro-Plata, worked by L. Hoffman. South of the Paymaster is Cerbat camp, near which is the Gem mine, F. Morgan superintendent. A contract for 300 feet of drifting on the third and fourth levels has been let to J. D. Jordan, who is working 20 men, and the superintendent is employing 10 men. This mine also carries gold values.

Two miles east of Cerbat, on the summit of the range, is the Stockton Hill M. Co., W. H. Cushing, of Topeka, Kan., president, M. Hughes in charge. On its two claims is a 400-foot shaft cut midway by a 900-foot tunnel. The ledge, 8 feet to 12 feet wide, crops out on the surface, and the pay streak is 18 inches wide in two chutes, one 250 feet long and one 150, cut by the tunnel. The ore carries galena, with silver, gold and zinc values. They are drifting on the ledge at the 370-foot level.

The Treasure Hill mine at the foot of Stockton hill is temporarily closed down, due to inability to handle the water struck at bottom of a 220-foot shaft. L. M. Teale, of Kingman, has the mine in charge, and H. F. Best, of Savannah, Mo., is president of the company. There are eight tunnels that have produced ore. A patent to the six claims has been applied for.

Cerbat, July 9.

### Yavapai County.

The Riley-McCabe M. Co. has been incorporated by J. L. Madden, L. Waggoner, J. K. Johnson et al., to develop the Jim Crow mining claim, extension of the McCabe mine at McCabe. M. J. Hickey is interested.

The Verde Chief M. Co. will resume operations on its mines in Black Hills district, near Jerome, this week. They have a tunnel 1000 feet in length, and the first work will be to crosscut the vein 600 feet from mouth of tunnel.

T. M. Earnhart, of Prescott, is reported to have leased the Model mill in Peeples valley and will add five stamps and a 20-ton cyanide plant to the equipment.

### Yuma County.

Machinery and lumber for the Bell of Arizona mine is on the ground at Quartzsite for a mill, being hauled by teams from Mohawk Summit. The road from Mohawk Summit to Quartzsite is in good condition and teams are loaded with one ton per animal.

The Castle Dome M. Co. has bought

four claims in the Old Napoleon camp, between Quartzsite and Ehrenburg. The claims contain high-grade ores of mercury and values in gold, silver and copper. The company intends starting operations October 1st and will put in a reduction plant about January 1st.

## CALIFORNIA.

### Amador County.

At the Central Eureka mine at Sutter Creek the June cleanup is reported at \$47,000.—At the South Eureka the mill started up last week.—The work of taking the water out of the Lincoln shaft is progressing rapidly. Work will begin on the tunnel as soon as the water is out.

At the Kennedy mine at Jackson the addition to the mill is going up.—About sixty men were laid off last week at the Zeila mine and the remaining crew put to work repairing the shaft.

Near Volcano, at the Treadwell mine, Superintendent Schenck has the 5-stamp mill in full operation.

At the Defender mine at Defender, Superintendent Joyce will sink and develop the property at a lower level. He will sink 100 feet before running crosscuts. The shaft will then be 400 feet deep.

At the Madrone mine at Volcano the mill is in operation.—The Glenn mine is still shut down owing to lack of water. The Robinson Bros' lease expired on the first of the month. The mill will not be started again before fall.

### Butte County.

J. M. Beck of Pasadena, W. J. Mellon of Challenge and H. Brittain and J. Ebert of Marysville are interested in gold-bearing gravels in the Clarence Humphrey place, near Oroville, which they are preparing to work, says the Mercury. The ground is being prospected. It is too shallow for dredging, but will be mined with a machine which is said to combine the principles of the dredger and hydraulic elevator. There are two kinds—one with a grizzly that can be worked with a 3 H. P. engine and 8 inches of water and handle thirty tons of dirt an hour; the other with a 3-foot circular screen, requires a 5 H. P. engine and 8 inches of water and will handle sixty tons an hour.

### Calaveras County.

The Panama mine at Washington ranch, north of Murphys, has been sold to Woodward & Fuller. Work will be started this week.—At the Sentinel mine, at Washington ranch, men are sinking to open the ore body.

Six men are sinking and others are grading for a mill at the Phillips mine in Washington ranch district, north of Murphys.

Arrangements are being made to start up the Boston mine, formerly the Esperanza, at Mokelumne Hill.

The New Pennsylvania placer mine, 3 miles from Mokelumne Hill, adjoining the Rooney mine on the southwest and covering the holdings of the Werle, Whitfield & Campbell claims, consolidated, is under bond to Richardson et al. of Oakland. Sinking a working shaft is under way. Bedrock was struck last week and 6 feet of gravel reported at depth of 135 feet.

### Contra Costa County.

The Iron Mountain C. Co., operating a smelting plant at Keswick, has bought fifty-five acres of water front land near Martinez for \$60,000, as a site for its works, which, it is said, will be built on the newly acquired property as soon as the removal from Shasta county can be effected. The site is on Bullshead Point, 1½ mile east of Martinez, and includes one-half of the water frontage in the Ertz 140-acre tract. Because of the deep water at the point the site was selected. Vessels can easily be handled there, as there is 30 feet of depth available at high tide. It is said work on the removal of the Iron Mountain C. Co. plant will be started this summer.

### Inyo County.

E. McGrath of Reno, Nev., is building a concentrating plant at Keeler to work 5000 tons of slag (the "Syauc" slag pile), the average assay of which is said to be \$25 per ton and the concentrates average \$120 per ton.

### Kern County.

The 130 stamps of the Yellow Aster mine at Randsburg continue in steady operation.

Havilah reports to the Californian say the owners of the King Solomon mine at Havilah have struck a 2-foot ledge carrying high-grade values.—The Big Four is still working with encouraging prospects.—The Kern River M., Dev. Co. has tunneled 250 feet and will go 200 feet more to tap the ledge. It is waiting for machinery.—Latham's Extension, on the east side of the road to Kernville, shows copper values; the walls on the west side are granite with serpentine on the east.

Bakersfield reports say the Standard

Oil Co. is making arrangements for laying a 12-inch pipe line from the Midway field to the Pacific ocean at Port Harford, a distance of 115 miles, across the Cuyama and Carisa districts, where land has been taken up, but little work done. Surveys for pipe lines over this second district have been projected by an independent company without result, but it is said the Standard has already made contracts for hauling supplies for the line.

### Nevada County.

B. Williams of Boston, Mass., of the company preparing to reopen the Idaho-Maryland mine at Grass Valley, says it is intended to increase the capacity of the mill so that 250 tons of ore can be treated daily. They also intend to put in a cyanide plant to treat the tailings from former operations.

### Placer County.

Men are at work at the Baltimore mine, near Forest Hill.—Superintendent R. Jones is increasing work at the Cash Rock mine, near Forest Hill. This is a river claim and can be worked only in the dry season. They are already down to pay.

A new concentrator and six machine drills have been put in at the Gold Blossom mine, near Auburn, and sixty men will be put to work.

### Plumas County.

The owners of the See & Jolly mine in Granite basin and the Malloy mine on Bucks creek, near Quincy, have put up a 10-stamp mill on the See & Jolly mine, which is running on \$10 ore, says Superintendent See. The company is preparing to build a similar mill on the Malloy mine.

In Genesee valley, near Genesee, the Five Bears M. Co., G. H. Goodhue superintendent, reports opening up a 6-foot vein of ore assaying \$15 per ton. The property has a 10-stamp mill, and to this is being added a Kinkead mill, cyanide plant and concentrators. The company is extending and connecting tunnels and doing other development work. The ore will be conveyed to the mill by gravity. The same company has stopped work on its quartz mine below Shooft temporarily and is devoting attention in that section to the cement gravel proposition at Iron Bar. This was equipped with machinery last year, but high water of last winter damaged the ditches, etc.

E. W. Perkins, foreman of the Jamison mill, says the Jamison mine has fifty men employed, and is mining and milling steadily. S. W. Cheyney of San Francisco, manager of the Jamison and Keystone mines, near Quincy, says he is preparing to build a 10-stamp mill.

### San Bernardino County.

(Special Correspondence).—At Daggett and Borate mining operations are practically suspended for the hot season. About twenty-five men remain at the Pacific Coast Borax Co.'s mine at Borate, but the reduction works at Marion are closed. The Clark road, which strikes across the desert from Daggett, is practically completed, 80 miles to Ivanpah, where it crosses the Barnwell branch of the Santa Fe running north from Goffs. The line is expected to do much for Death Valley and the mining interests of the desert generally.

Daggett, July 10.

(Special Correspondence).—The producing companies at Camp Rochester, in Bagdad district, are the Bagdad-Chase G. M. Co. and the Roosevelt M. & M. Co. The former has been operating three years and has two miles of workings. It is producing 200 tons of ore per day. The low-grade is worked by a 10-stamp mill at the mine and the high-grade is taken to the 50-stamp mill at Barstow and treated by amalgamation and cyanide. At the mine ten gasoline engines, ranging from 5 H. P. to 12 H. P., supply the power, and the 10-stamp mill is operated by a 40 H. P. engine.

The Roosevelt has been developing the past two years. The company is putting up a 10-stamp mill, with arrangement for twenty additional stamps when required. The process contemplates saving of copper values in the ore. Leaving the stamps the pulp will pass to sizers and the slimes separated, after which the copper will be leached by a 5% solution of sulphuric acid and the residue cyanided. The copper will be precipitated on scrap iron. An 81 H. P. gasoline engine will operate the mill, and one of 14 H. P. runs the hoist. The shaft is an incline following the vein, 450 feet deep, with a vertical depth of 304 feet below the collar of the shaft. The ore body is developed with 1531 feet of workings, vein running from 12 feet to 45 feet in width. The vein matter is porphyritic. Average values throughout the mine run \$10 to \$12 gold, with some silver and copper. On the 400-foot level a heavy lead of red and black oxide of copper has been struck, through

which is copper glance. This occurs in the vein, but does not carry much gold values. The vein dips west at an angle of 45° and the copper lead pitches at an angle of 24° to the northwest in the vein. It varies from 2 to 8 feet wide. As yet it has not been developed enough to determine its significance. The company ships to the smelters. Hitherto all water used in the camp was brought from Newberry, on the Santa Fe, via Ludlow, and its scarcity hindered operations. Recently the Roosevelt Company struck water in quantity in a well and will pipe it 9 miles to the camp. It will be pumped to the summit through a 6-inch line, thence by gravity through a 4-inch and finally reduced to 2-inch to camp. The summit is 1300 feet above the well and the fall to camp will be 672 feet. About 300,000 gallons per day will be supplied at first. The Roosevelt's ore body is a contact between a porphyry footwall and a granite hanging wall. There are several other companies developing in the district, among them being the John Suter G. M. & Co., adjoining the Bagdad on the east; the Ludlow Belle, on the north, and a company on the western extension of the Roosevelt. This district is 8 miles from the main Santa Fe line and connected with it by the Ludlow & Southern Railroad Co. With transportation and a good water supply it will be free from the more serious hindrances to desert mining.

Camp Rochester, July 11.

#### San Diego County.

V. V. Angel of Mesa Grande, foreman of the Himalia M. Co., reports the mines are working ten men and are producing gems. To the present all work has been done within 20 feet of the surface, but the company has started to drive a 200-foot tunnel to strike the ledge lower down.

#### Shasta County.

F. H. Dakin, Jr., of Berkeley has a driller at work prospecting the Dakin tract, consisting of 400 acres lying along the river within the corporate limits of Redding. He says the entire tract will be prospected for auriferous gravel preparatory to dredging.

#### Siskiyou County.

The Railroad & M. M. of Colorado has bought the Williams Point, Sunnyside, Old Channel, Anona, Indian Girl and Native Daughter mines and mining ground at the Big Bend of the Klamath river, near Nolton, and the Minetta B and adjacent mines and mining ground 6 miles up stream. With the Minetta B. they acquire the ditches, flumes and water right to Thompson creek. The R. & M. Co. will extend the upper ditch down beyond the Happy Camp divide and work with 3000 inches of water the gravel deposits. Later on the ditch will be extended to Happy Camp, covering another tract of mining ground owned by the company, making in all about 2000 acres. The water of the lower ditch (3000 acres) is taken across the river on a suspension bridge to work the Minetta B. mine. A lighting plant has been put in at the Minetta B. and work will be continued.

G. G. Mullins, for the Ricoro M. Co. of Los Angeles, has bought the Classic Hill mine on Indian creek, 14 miles above Happy Camp, and is preparing to start work.

The work of sinking shaft on the Lucky Jack ledge of the Headwaters group on North Fork of Humbug creek, near Hawkinsville, was stopped last week on account of foul air 70 feet down. The men are at work on the tunnel in the hill lower down, which is supplied by air through a winze made several weeks ago, and expect to tap the Lucky Jack at a better point; to then start a raise in taking out quartz. Manager Johnston has thirty-eight men at work. He is preparing to build a 20-stamp mill, for which the sawmill is turning out lumber.—Humbug creek at and above the fork is active this season, says the Journal, about 200 men being employed, with prospective addition of more as development work progresses in the several mines being opened.—The Etna Advance says machinery is arriving for the Morrison & Carlock mine at Quartz Valley. It has put in an electric plant and is lighting mine and mill with electricity. Two 5-stamp batteries will be added to the milling plant, also an air compressor and machine drills. Superintendent J. M. Morrison has added an assaying laboratory.—Work has been shut down for the season at the Spengler mine at mouth of Humbug, near Hawkinsville. The water has not yet run out, but there is sufficient to work to advantage.

#### Trinity County.

Work is under way on the Lappin mine at Deadwood. The water was pumped out of the winze and two men are stopping there. Men are clearing the stopes, and as soon as there is room more men will be put to work. The richest ore will be

shipped and the lower grade crushed at the Brown Bear mill. H. Blaney is superintendent.

Graves & Co. have begun work on the Maple mine, 8 miles above Dodge's, near Dedrick. They have men at work drifting on and crosscutting the ledge.

#### Tuolumne County.

J. S. Kuns of Los Angeles has bought an interest in the Phillips group of mines on the Tuolumne river, near Groveland. The debts have been paid and the mill will be completed. The group consists of the Los Angeles, Antioch, Half Breed, George and Phillips claims, says Superintendent Phillips.

B. A. Jeffery of San Francisco has a bond on the Free Lance quartz mine, near Tuolumne, for \$7000, and will pay 20% of the gold extracted during the life of the bond.—The Whitto interests in the Stanley quartz mine and millsite, together with improvements, on Kanaka creek, 1 mile east of Jacksonville, have been sold to C. A. Fitzgerald.

The miners, 150 in number, of the Jumper Gold Syndicate's mines at Stent went on strike last week, due to an order posted by the management that "all underground workmen would be required to strip to the naked body before passing through the change room in going on and off shift"—a measure intended to prevent specimen stealing.

Work at the Longfellow mine, near Groveland, is progressing and the mill is in operation. The grading for the addition is complete and wall building begun. The cable from mill to pump is in place. Drifting continues on the 400 and 500-foot levels.

### COLORADO.

#### Boulder County.

The Mogul tunnel, near Eldora, is again in operation and power is being furnished to several parties who are operating through the tunnel.

#### Chaffee County.

Near Buena Vista the Paywell G. M. Co. is reported shipping this week a carload of ore from its Brittle Silver group that averages \$75 per ton silver. A car per week will be sent out. The lower tunnel is nearing the ore shoot of the upper tunnel.

#### Custer County.

Custer reports say at the Ben Eaton mine the engine and machinery have been put in working order and the pump started unwatering the mine. Manager Bassett says the shaft will be unwatered and sunk 100 feet deeper before drifting is started.—The contract let by the Custer M. & R. Co. on the Dolomite mine is progressing. A station will be put in at the 100-foot level and a drift run.

#### Fremont County.

The tailings dumps of the National mill south of Florence have been leased by D. Myers of Cripple Creek. The dumps will be equipped with cement sluice boxes.—The Colorado F. & I. Co. is cleaning up the Rockvale coal mine, near Florence, which has been idle for nine months, preparing to hoist coal.

#### Gilpin County.

Smelting ore is being shipped by the Gold Dirt M. Co. of Rollinsville to Denver over the new Moffat railroad. The company is making preparations for building a 50-ton stamp mill.

Eastern people have leased and bonded the Atna mine on Quartz hill, near Central City, with G. E. Wrockloff of Canon City as manager. The machinery is being overhauled and the shaft and level workings will be put in repair, when development will be resumed. The property is west of the California mine. Its deepest workings are 400 feet.—E. R. Fouts, D. Davies, M. A. Harris, G. Miller and T. Turner have formed a pool for the operation of the Grizzly mine at Russell Gulch, which they have under lease and bond. The main shaft is reported down 200 feet. The shaft will be retimbered and cleaned out to the bottom.

During the month of June the shipments from the Quartz hill properties of the Kansas-Burroughs Co., near Central City, amounted to 145 cars, or 1235 tons. The shipments were made over the lines of the Gilpin tramway, the bulk of the ore going to the stamp mills and concentrator at Black Hawk.

#### Gunnison County.

The Bowerman Citizens' Dev. M. Co. has been incorporated by Bowerman, Pitkin and Gunnison parties to develop a group at head of Box canyon. The directors are F. G. Kress, J. Chapman and W. J. Nourse of Bowerman, P. Dice of Loraine, S. Dickinson and D. C. Mason of Pitkin, S. L. Whipp of Gunnison and G. G. Witzke of Pueblo. The company has a lease and bond on the Baxter, Alexander and Wilbur lodes, west of Bowerman, on the Quartz creek side. The company

will drive a tunnel from 600 to 800 feet, to cut the vein at depth. The vein crops on the surface for several hundred feet and the tunnel will be a drift on the same.—The Gunnison & Cripple Creek G. M. Co. has been incorporated at Bowerman by M. Mullen, J. Mitchell, J. R. Hilton and R. Blanchard. The company owns the Blanchard claims south of the camp.

The Bowerman-Home M. & Dev. Co. has been incorporated by Bowerman and Pitkin men, with D. C. Mason, J. Chapman, F. G. Kress and W. J. Nourse. The company has bought two claims, Baxter and Baxter No. 2, on the Quartz creek side of Copper mountain, 2 miles below Pitkin, and will begin work this week. A 5-foot vein of ore assaying \$8 is exposed on the property.

#### Lake County.

The output of Leadville district for the month of June is reported at 66,000 tons of ore. The zinc production of Leadville mines during June amounted to 8000 tons, the average production of this mineral during the first six months of the present year. The production of manganese ore has been restricted by market conditions this year. At present the only manganese being shipped comes from the Star, from which Manager Dickerman is shipping four carloads a week.

Preparations have started to sink the Coronado shaft at Leadville. The breaking of ore has stopped and the necessary changes are being made to begin sinking. The main Coronado shaft is 4½ feet by 10 feet in the clear. The shaft will not be interfered with down to the present bottom level. From that level as far down as it becomes necessary to sink, the shaft will be enlarged to 4½ feet by 15 feet in the clear, in order to accommodate the sinking pumps which will be put in. The shaft will be sunk to a depth to draw off the water from the Penrose. The idea is to divide handling the water between the two shafts. The Penrose has relieved the Coronado of about 400 gallons. When the Coronado has been sunk deep enough so that 300 gallons of the Penrose water can be drained into it the two shafts will be sunk simultaneously and into the horizon below.

#### La Plata County.

(Special Correspondence).—The May Day mine is working two shifts with air drills in the tunnel and one shift in the mine, where they are taking out high-grade ore. The shaft is 300 feet in depth and the vein continues strong and of good quality. This is the only shaft in the La Plata mountains over 160 feet deep, except that of the Neglected mine at Oro Fino, which has been a steady producer for two and a half years, and is milling sixty tons of ore per day.

The Empire M. Co. is pushing work in the tunnel and making headway toward the vein.—The Chief M. Co. is drifting in a body of high-grade ore and preparing to install a milling plant.—Manager Deming will increase development work on his mine at the head of Boren gulch, where he has a large body of low-grade ore.

A strike has been made by Cripple Creek prospectors on the hill south of Burnt Timber gulch. The vein is 12 inches wide and has been opened for 100 feet on the outcrop, a channel sample taken the entire length running \$134 per ton in gold, silver and lead.—Brown Bros. are increasing development of their group at the head of Bedrock gulch, where they have a vein of galena carrying gold and silver values.

The Bonnie Girl Co. is excavating for its mill and cyanide plant and the machinery will be set up this month.

Durango, July 10.

#### Montezuma County.

(Special Correspondence).—The Old Kentucky M. Co. on the East Mancos river has been opening up a body of ore in the lower tunnel. The tunnel is 100 feet in length. The ore body is 12 feet in width and averages \$34 per ton in gold, silver and lead, with 2% to 5% copper. The company proposes building a mill. It is owned by Cripple Creek men, with D. H. Franks as manager.—Satisfactory showing is being made by the Silver Falls mine across the river from the Old Kentucky, the vein being 4 feet wide and carrying \$9 per ton in free gold. A blanket vein which crosses this group has been opened on an adjoining property and shows values of \$5 per ton. It is 3 feet in thickness.—M. L. Bentley, who has been drifting on a claim at the head of the East Mancos river for a year past, to cut the Timberline vein which crosses the Doyle property, reports he has reached ore. It is 4 feet in width.

Mancos, July 10.

#### San Juan County.

J. B. Patterson, J. Bordeleau and A. Johnson are making ore shipments from the Champion mine, on Sultan mountain,

below Silverton. The ore is of copper, carrying values in gold and silver. The ore being shipped is taken from the drift. No stoping as yet has been done. The vein is 7 feet wide.

#### San Miguel County.

Pending installation of additional machinery in the mill and completion of development in the mines, the Caribou-Montezuma at Ophir is temporarily closed down. Slimes tables to handle the tailings a second time are being set up. New batteries are being put in and the concentrators are being overhauled. The mill has a capacity of thirty tons daily and the concentrate shipments amount to four carloads per week. In addition to this output, three carloads of high-grade ore as it comes from the mine is shipped direct to the smelters weekly. The development in the mines is in driving drifts and levels and making a raise for ventilation. O. Erickson is manager.

Operations have been started on a group of seven claims in Gold King basin, near Telluride, by E. M. Titus of Telluride and R. S. Morrison of Denver. They have a lease and bond on the claims. Manager Titus is cleaning out the old workings preparatory to shipment of ore. The first work has been started on the Bohemia in the upper tunnel.

#### Summit County.

So far this season the Gold Pan M. Co. has worked out an acre of ground in the pit near the south end of Breckenridge, says the Times. With from two to three hydraulic giants playing on the 70-foot high bank of the breast of the pit the gold-bearing gravel has been kept steadily moving through three sluices on the bedrock of the pit, to the intakes of the three hydraulic elevators. While probably two-thirds of the placer gold remains between the interstices of the steel riffles of the three sluices on the bedrock, last week the west sluice of the elevated flume was cleaned up, to see how the ground was running, and a 193-ounce gold bar resulted—this at the end of one month's run. As the ground being washed is rich and the water supply abundant, the cleaning up of the bedrock sluices will be delayed until the water supply is only sufficient to operate two elevators. Then the sluices will be cleaned up alternately. The placer ground of the Gold Pan Co. extends from the right-of-way of the South Park branch of the Colorado & Southern railway, south, and up the Blue River valley for 5½ miles to the mouth of McCullough gulch.

The placers in Hoosier gulch, near Breckenridge, owned by W. Benrose, will be operated by the Hoosier Gulch G. M. Co., incorporated by Massachusetts men. They will also develop lode mines. The company will sink a shaft to depth of 200 feet on a vein that is a part of the 250 acres controlled by the company. The outcrop of the vein shows assay values in gold and silver and is expected to make a producer of smelting ore with depth. T. A. Brown, of Breckenridge, will have charge of sinking the shaft. The directors of the Hoosier Gulch G. M. Co. for the first year are E. Loring, G. Purrington, J. E. Bartlett, J. W. Churchill, O. B. Cole, of Massachusetts, and W. Benrose, of Breckenridge. The property is 12 miles south from Breckenridge, in Hoosier pass, which is crossed by the county road leading to Alma and Fairplay.—The Mecca G. M. Co., organized by W. Lennox and T. W. Giddings of Colorado Springs, N. B. Scott, of West Virginia, and M. G. Evans, of Denver, to operate the Mecca and French Gulch companies' placers, near Breckenridge, made a cleanup last week after a few weeks' run in the hydraulic elevator pit and report satisfactory results, \$5000 worth of placer gold and nuggets being taken out. This is said to be about 70% profit over the cost of extraction. This company is putting in a drain and working sluiceway which, when completed, will be 2600 feet long and will tap the elevator or Kingsbury pit at bedrock and facilitate the economical operation of the property.

#### Teller County.

Manager H. M. Gilbert, operating the Hoosier mine on Tenderfoot hill, Cripple Creek, for the Milwaukee Mutual M. Co., resumed operations last week after a close down of several weeks. Six men were put to driving a drift from the shaft at a depth of 675 feet from the surface. The breast of the drift is in 30 feet and it is thought with another 20 feet they will reach the ore shoot.

At Cripple Creek the Denver & Southwestern R. R. Co. is pushing work of grading to the mines on the west slope of Beacon hill, and indications are that all of the new shippers will be connected up by switches with the main line by August 1.

The Mint property, owned by the Index Co., has resumed operations under management of B. Pullin, who has a lease

on it. Extensive development work is planned. He will sink the shaft 300 feet, giving it a total depth of 1045 feet from surface. Royalties range from 15% to 30%. C. Ridpath is superintendent. The company owns a total of twenty-seven acres and is equipped with a plant of machinery to hoist from depth of 1200 feet, and besides this has an air compressor.

The work of washing and sorting over the old El Paso dumps at Cripple Creek is about completed by D. Bernard, who has been working there for several months past. He has been making 240 tons of ore a month from the dump. The rock has been of low grade.

H. H. Hand of Denver has bought control of the Prince Albert M. Co., operating on Beacon hill, Cripple Creek, for \$75,000. A plant of machinery will be put on the property and deep mining engaged in, says Hand.

The following figures by the Gazette show the tonnage and production of Cripple Creek district for the first six months of the present year:

	Tons.	Total Value.
January.....	51,500	\$ 1,753,000
February.....	54,500	1,030,000
March.....	54,300	1,746,000
April.....	58,800	1,851,400
May.....	60,500	1,805,500
June.....	52,700	1,007,000
Totals.....	332,300	\$10,522,800

## IDAHO.

### Idaho County.

(Special Correspondence).—The ore from No. 4 tunnel of the Jumbo mine is run direct to the mill, 75 feet. Value, \$17.

The Colonel mine will be on full time when piping and fan arrive. The ore body is 16 feet in width, with \$28 in values.

W. S. Brown, manager of the Concord M. Co., will put in a large compressor for the Mother Lode No. 2.

Drifting south on the Atlas is being pushed in ore \$18 in value. The shaft is down 200 feet, with 15 feet of sump. The drift is from the 200 level.

The Oro Fino tunnel is in 850 feet and ore is being blocked out. This work is all on the ledge and will tap the old workings on the Big Buffalo 700 feet in depth. The tunnel will be 4000 feet long.

The Crackerjack mill, ten stamps, is pounding \$17 ore.

The Live Boy mine is still blocking out good ore and E. Kelley, manager, states their mill will be in operation August 1st. Hump, July 6.

L. C. Van Riper of Boise says he is arranging to put in machinery at the Wordenhoff mine in Big Creek district.

J. E. Jewell, superintendent of the Thunder Mountain G. R. Co., operating near Roosevelt, says arrangements are being made for a 5-stamp mill to be put in at the Confidence mine, formerly the Mayflower. More men are being put to work.

### Shoshone County.

Monthly shipments from the mines of the Cœur d'Alenes are approximately 21,000 tons of ores and concentrates consigned to the smelters.

The Bunker Hill & Sullivan mine at Wardner is shipping 5000 tons of concentrates a month. The four properties of the Federal M. & S. Co. send out between 7000 and 8000 tons a month, the largest amount coming from the Last Chance mine at Wardner—approximately 3500 tons. The Morning mine at Mullan, owned by Larson & Greenough, ships 3100 tons of concentrates. The Hercules and Hecla consign about 1000 tons each every month. The Gold Hunter mill at Mullan is turning out concentrates after an idleness of six months, and the shipments from the Snowstorm are increasing. The ores from the Cœur d'Alenes are treated in many parts of the country—California, Washington and Colorado, and some even in Perth Amboy, N. J. At times the concentrates have been sent to El Paso, Tex., Omaha, Neb., and Salt Lake, Utah.

Ten men are at work at the Morning compressor plant, at the mouth of Grouse gulch, 3 miles west of Mullan, grading for a transformer plant. This additional power will provide for forty more drills. The present power supplies one hundred. An addition is also being built to the Morning mill. The new vanner house is being connected with the mill and eight vanners will be added.

It is said construction has begun on the leaching plant to be built at Larsen's spur, east of Mullan, by the Waterbury Metal Extraction Co. The plant's capacity will be 400 tons per day. While the plant is primarily for Snowstorm copper ore, it will handle custom ore.

## MICHIGAN.

### Houghton County.

(Special Correspondence).—Lake Superior copper production is heavier than ever before. During the past three and a half years the Lake mines have greatly

increased their output, as is shown by the following figures of production:

Year	Output, Pounds.
1900	142,151,371
1901	155,691,145
1902	170,355,508
1903	192,326,191
1904	218,000,000

The production given for the current year is necessarily an estimate, but under a continuance of normal conditions will closely approximate the actual figures of output. In 1894 the production of refined copper was 114,308,870 pounds, the largest ever secured to that time, with the single exception of 1892. The output of the district did not reach 100,000,000 pounds in any year previous to 1890. In 1884 the production was 69,353,202 pounds, which was 10,000,000 pounds in excess of any previous year. In 1874 the output was but 34,334,389 pounds—a production that is less than half that of the Calumet & Hecla alone at the present day, and which will be approximated this year by the Copper Range group of mines alone, and considerably exceeded by the Bigelow group of mines. Relatively the Lake mines have lost, for new and important sources of copper supply have been developed during the past two decades in Arizona, Montana, Utah, California and elsewhere. In 1869 the Lake mines made 95% of the copper produced in the United States, but under the influence of Western competition the proportion of Lake copper to the total American supply decreased to 47% in 1884, 32% in 1894, and 26% in 1902. The output of 85,949 long tons of refined copper made by Lake Superior mines last year was greater than the production of all copper mines of the entire United States in a year so comparatively recent as 1887, and nearly as large as the average annual production of the entire world for the decade 1861-1870. The impression, prevalent in some quarters, that the Lake Superior copper district is a played out field, is not supported by the figures of production. The only copper district in the world that produces more metal is the Butte district of Montana, though Arizona, as a whole, with its four great producing districts, promises to rival Michigan in total output within two years. During the first half of the present year the Calumet & Hecla has completed the rebuilding of the first section of its Hecla mill and has begun work on the second section. The work of rebuilding the old mills, or rather, of tearing them down in sections and replacing the parts destroyed with new steel mills, will require three years for completion, at the end of which time the productive capacity of the company's milling plant will be greatly increased. Explorations on the Kearsarge lode upon Calumet & Hecla lands are highly encouraging, and a diamond drill has been at work on the lands lying west of the mine. Houghton, July 9.

The June production of several of the Lake copper mining companies indicates a falling off from the output of the previous months, and also from the returns for the corresponding months last year. Approximate figures reported are:

	June, Tons.	May, Tons.	Jan. 1, Tons.
Isle Royale, Houghton.....	100	100	552
Mass, Mass. City.....	100	140	920
Oscuela, Opechee.....	1,225	1,270	7,095
Tamarack, Calumet.....	540	565	3,585
Calumet & Hecla, Calumet.....	3,225	3,250	19,450
Adventure, Greenland.....	40	60	405
Wolverine, Kearsarge.....	528	502	2,989
Atlantic, Houghton.....	206	308	1,797
Michigan, Rockland.....	161	165	811
Baltic.....	797	744	3,810
Champion.....	715	754	3,778
Trimountain.....	760	741	3,561

## MONTANA.

### Deer Lodge County.

Anaconda reports say a strike has been made in the Long Spring mine, near Moose lake. The mine is owned by M. Johnson, J. Long and J. J. Harper. The ore carries galena, with values in silver, and Johnson says there is a lead 80 feet in width. The mine is 6 miles from Moose lake, near the Senate property.

## NEVADA.

### Elko County.

G. D. Wheeler of Tuscarora, having bought the Grand Prize mine for \$12,000, is preparing to put up a 40-ton concentrating plant, including a Huntington mill and table, with which to handle the ores from his ground and also the dump of the Grand Prize mine. The distance of the property from the railroad, as well as the high freight rates, made concentration a necessity. The values are gold and silver.

R. P. Hunter, president, and J. J. Carmichael, manager, of the Aura King G. M. Co., operating near Mountain City, are preparing to increase equipment for the mine and mill. The mill, with which the mine is equipped, consists of a battery of five stamps of 800 pounds each and a Frue vanner. The machinery is driven by water power.

### Lincoln County.

Manager P. Thacher of the Iyanough M. Co., near Searchlight, is taking in supplies and materials preparatory to increasing development. Drifts and crosscuts will be run. The shaft is down 100 feet.

The supply of water in the Good Hope mine at Searchlight is reported increasing. As the west drift on the 400-foot level advances a greater volume is developed. The presence of so much water has made it necessary to stop drifting until the drift has been timbered up. The pump is run constantly. The face of the drift is in 200 feet and shows values. Eighty feet is the estimated distance yet to be run before cutting the ore shoot. —The Cyrus Noble M. Co. has an option on the Good Hope water supply and proposes to build a mill. —At the Quartette mine at Searchlight, Superintendent F. J. Harrington is preparing to add ten stamps, which will give the Quartette Co. twenty stamps at the mine. As work progresses on the 700-foot level the water supply is increasing. The winze between the two lower levels is completed.

Controlling interest in the Providence mine of Cedar canyon, near Davenport, has been sold to the Houghton-Thurston Co. of Boston, Mass., for \$150,000 cash. The property has been transferred and is being developed under Superintendent M. A. Lathrop. The ore is said to carry high-grade silver values.

The Good Hope mine at Searchlight has been taken over by a company organized by F. F. Oster et al. of San Bernardino, Cal. The mine is between the Quartette on the southeast and the Searchlight group on the northwest and consists of four claims. T. L. Henderson, of Searchlight, is manager. The present equipment and workings of the company consist of a 22 H. P. hoisting engine, capacity for sinking (shaft is sunk 375 feet) to 700 feet. The workings consist of main shaft and three drifts. Work is going on in a drift on the 375-foot level. A water supply of 20,000 gallons a day, sufficient to run twenty stamps, has been developed in the mine. The main shaft is double compartment, on an incline of 65°, and is furnished with a Cornish pump. As soon as sufficient ore has been blocked out a mill will be built.

Superintendent Ross of the Empire mine, near Searchlight, says the tunnel is in 420 feet, and at 20 feet more connections will be made with the main shaft. On the completion of this tunnel the company will be ready to put in milling machinery.

### Nye County.

The railroad into Tonopah will be ready for running operations this week, says Manager A. Tripp. Passenger fare will be 10 cents per mile. Under the new freight rates Manager Tripp says that \$40 ore can be transported to the smelter at a profit. It will cut the cost of teaming fully two-thirds.

The Reveille district, in Nye county, 25 miles south of Ely on the road to Tonopah, is being reopened, says the White Pine News. Lynch & O'Meara, of Tonopah, have a bond and lease on the Last Chance mine in the Reveille district for \$150,000. They have begun work on the mine. They have two 14-horse, three 12-horse and six 6-horse teams hauling the ore from Reveille to Tonopah, where it is piled up waiting the completion of the railroad. Sixty men are at work in the mine taking out ore which is principally silver with a small percentage of lead.

## NEW YORK.

### New York County.

The discovery is reported made at Columbia University, New York City, that the rocks of the heights on which the university campus stands contain a material percentage of copper. The discovery has led to the presentation to the faculty of the school of applied science of a plan to open a mine under the campus, in which students shall receive practical work in tunnel driving, shaft sinking and other departments of practical mining.

## NEW MEXICO.

### Rio Arriba County.

A. E. Young et al., who hold a lease and bond on the Buckhorn mine in Bro-mide district, near Tres Piedras, are drifting on the vein, which is over 3 feet wide. The ore is a sulphide averaging \$30 per ton, and is being sacked pending arrival of mill supplies. As soon as mill supplies arrive, sinking will be resumed.

### San Miguel County.

The copper reduction mill of J. L. Matt has been bought by the Blake M., M. & I. Co., and will be removed to the Tres Hermanos mine of the company. It is expected by additions to the machinery and to the tank capacity to make a 50-ton mill of it. Water will be supplied by gravity. Wood is close at hand. A down grade of

5 miles is between Tres Hermanos and the Santa Fe railway at Bernal.

### Socorro County.

The New Mexico School of Mines at Socorro is reported to have added to its equipment, for practical training of its students in mining operations, the Torrance gold and silver mine in the Socorro mountains, 2 miles from the college campus.

## OREGON.

### Baker County.

A one-half interest in the Cartwright placer mines at Rye valley, near Baker City, has been sold to J. Drew for \$16,000. The other interests are retained by R. A. and D. L. Cartwright. Operations will be increased.

Mining operations are reported improving in Pocahontas district, 8 miles northwest of Baker City. The Albert Creighton Co. of New York has taken over the Carpenter Hill group, consisting of five claims, for \$75,000, and has increased the number of men at work. The 10-stamp mill will be put in operation as soon as sufficient ore is taken out to justify. —The Young America is showing up well under new management.

A body of ore is reported opened up in the Ornamet group of claims near Greenhorn. Assays give returns of \$40. The ore contains silver and gold. The property is under management of F. Warren.

### Jackson County.

H. Schaeffer, superintendent of the Gold Hill Dev. Co. at Gold Hill, says work will be resumed and 200 men employed on the new electric power and smelting plants.

### Josephine County.

The Oscar Creek hydraulic mines have been bought by Foster & Gunnell of Grant's Pass for Eastern men and initial payment made. The Oscar Creek hydraulic mines are on Applegate river, 10 miles from Grant's Pass. They comprise 226 acres of mineral ground, 108 of which are patented. The diggings are of creek bed bars, bench and rim channel. The placer are equipped with two No. 1 giants and several thousand feet of flume and piping and 3 miles of ditch. The new owners will increase the length and width of the ditch, add to the water supply and increase equipment.

## SOUTH DAKOTA.

### Lawrence County.

Deadwood reports say operations are resuming on the property of the Ivanhoe M. Co., and during the season the main shaft will be sunk to 500 feet.

With the restoration of railroad communication between Deadwood and the Bald Mountain mining country, after being cut off over three weeks, there is a general resumption of mines and mills, says the Black Hills Review. The mining companies took advantage of the suspension to improve their properties and to make repairs at the plants.

The Golden Elk M. Co. has been incorporated at Deadwood for development of mining property near Bear gulch, in western Lawrence county, by E. B. Sager, L. Dickinson, B. Mills, G. Sager and G. Dickinson.

The plant of the Hidden Fortune G. M. Co., on Whitewood creek, near Deadwood, is running again after a three weeks' suspension on account of the flood damage to the railroad between the mine and mill. Ore is arriving regularly again. During the idleness work was in progress at the mine and the ore bodies were further opened up and blocked out and improvements added to facilitate mining and loading. The ore is being crushed in a weak solution of cyanide and passed over plates for amalgamation. The plates are heavily silver-plated and are said to resist the action of acid more effectually than copper.

### Pennington County.

The Black Hills Anaconda M. & M. Co. is operating on 250 acres of mineral land 6 miles south from Rochford. The principal development is a two-compartment shaft, which is down 100 feet on a ledge that may be traced across the property. The ore is said to average \$5 per ton in gold. G. A. Karr, manager of the company, says he is preparing to put in a grinding mill of fifty tons daily capacity.

Men are at work on the Ethel M. Co.'s property, 5 miles west of Rochford. A working shaft is being put down.

It is reported that J. Craig has found a body of free milling gold ore on his mine, north of Rochford.

## UTAH.

The production for the first half of the year 1904 in the mines of Utah, as shown in the settlements made in the open market, aggregates \$10,979,000, says the Salt Lake Herald. While the figures are not yet available, it is estimated the product

of the copper smelters operated by individual companies has been worth, owing to the gold and silver values accompanying the copper, at least \$5,625,000. The ores and bullion sent out of the State for sale and not accounted for in the figures secured locally will increase the latter amount to about \$6,000,000, so the total production from all sources should approximate \$17,000,000. These figures indicate that last year's record of between \$26,000,000 and \$27,000,000 will be passed this year. In Utah mines practically all of the dumps are connected by rail, while many of those which are not, carry ores that permit of hauling by team to loading stations and marketing at a profit. In addition to these natural advantages, there is no friction worthy of mention on the labor question.

The ore and bullion settlements in the open market for the half year ending with June 30 attained a total of \$11,267,540, compared with \$11,219,200 for corresponding period last year, says the Salt Lake Tribune. This aggregate does not, however, include the value of bullion that has been drawn from the furnaces of the copper plants in the valley during same period, which latter has a valuation of at least \$4,000,000. Data from these sources are accessible but once a year. In the open market returns are made from day to day as sales of bullion and of ore are certified to the banks. That the increase over the corresponding period in 1903 is not more marked, the reason is, says the Tribune, there has not been an increased furnace capacity, although the management of the American's plant at Murray has made requisition on the company for two more blasts, on which construction will be started this month. To supply these, and more, the diggings are ready. The installation of lead blast furnaces at the United States smelter will create a market for an additional volume of that class of ore. The output for the six months follows:

January.....	\$ 1,790,100
February.....	1,793,500
March.....	2,013,600
April.....	1,899,140
May.....	2,004,700
June.....	1,776,500
Total.....	\$11,267,540

The shrinkage in June—although it shows increase of \$171,990 over June, 1903, was due to refusal of the producer to rush onto a low market with his silver bullion.

#### Utah County.

The Bullion-Beck Tunnel Co. and La Reine M. Co. have filed for record deeds and assignments which transfer the property of each to the Beck Tunnel Con. M. Co., the property involved being the East Bay mine, Montana, Protection and the Big Eastern of the Bullion-Beck Tunnel Co., and Mahogany, Narrow Gauge, Independence and Flagstaff of La Reine Co., in Tintic mining district, near Eureka. The Beck Tunnel Con. Co. has also taken over the Cyrus Oliver lode for \$6000.

During month of June, 577 carloads of ore were shipped from the mines of Tintic district, distributed as follows:

Ajax.....	13
Bullion-Beck.....	24
Carissa.....	22
Cornucopia.....	1
Centennial-Eureka.....	209
Brown, R. A.....	2
Eagle & Blue Bell.....	4
Gemini.....	86
Grand Central.....	91
Laclede.....	2
Lower Mammoth.....	2
Mammoth.....	62
Salvador.....	2

Uncle Sam (concentrates).....	12
Victor.....	7
Yankee Con.....	21

#### Salt Lake County.

Superintendent A. O. Jacobson says the Columbus Con. M. Co. electric power plant near Alta was put in operation last week, and also the compressor plant. The compressor has capacity for 700 cubic feet of air per minute, and is driven by a 100 H. P. motor. The Alta-Quincy mine will receive power from the Columbus compressor. The machine drills, pipe and other equipment for the air line for the South Columbus Co., which is also to buy power from the Columbus Con. Co., are being put in. The grading for the Columbus Con. mill is completed and the lumber and machinery are on the ground, says Superintendent Jacobson.

The Bingham Con. C. Co., which controls the Eagle & Blue Bell, reports the hoist set up over the shaft and that there is now a direct connection between the surface and the 600-foot level. With the starting of the hoisting plant, miners were lowered to the 600-foot level and open up the body of gold, silver and copper ore which has been made easier of access by the improved equipment, says Manager MacVichie.

Chicago, Ill., men have organized the Kessler's Peak M. & M. Co. to absorb the

Wheeler & Wilson M. Co., in Big Cottonwood district, near Alta. W. F. Gray, manager, says it is intended to drive a tunnel lower down and that it will require at least 1000 feet of tunneling to tap the ore bodies showing above and will give a depth on the vein of 3000 feet, whereas, the upper tunnel cuts the ore only 800 feet under the surface. The Kessler property is a mile from the Maxfield mine. There are twelve claims in the group and the ores carry lead and silver values.

Manager Channing of the Highland Boy smelter at Bingham says the reverberatory roasters are in full operation.

#### Utah County.

C. W. O'Donnell, of Vernal, of the American Asphalt Co., says his company is working six men at its property 6 miles from the Colorado line and producing all the gilsonite which teams can be found to haul. Mack, near Fruita, on the Rio Grande Western, is the present shipping point, but the new railroad being built to the gilsonite mines will reduce the haul of the American Co. to 6 miles. O'Donnell says that the road has been graded for 40 miles and that 30 miles of steel have been laid.

The Acme Ozocerite Wax Co. of Salt Lake City has been organized by G. F. Culmer of Chicago, Ill., H. C. Bailey of Akron, O., H. L. and G. C. Culmer and H. E. Culmer of Salt Lake City to mine mineral wax, ozocerite, earth wax and other hydrocarbons in Uinta county.

#### Utah County.

The Tidal Wave M. & M. Co. has been organized at Provo to develop the Buffalo Hump and nine other claims in Utah county. The officers are J. & W. A. Pierce, J. N. Christensen, J. M. Pierce and G. Elliott.

#### Tooele County.

At the Herschel Co.'s properties at Mercur operations will be resumed this month, says Director Keifer of Salt Lake City, the intention being to sink from the surface to a connection with the gold-bearing ores that were opened up through a drift from the Sacramento mine. To make this connection, 60 feet of sinking will be required.

G. Dern, manager of the Con. Mercur, reports work progressing satisfactorily in the company's Golden Gate mill. A. H. Brown, with W. T. Janney, has a lease on the old Mercur mill and will begin treatment of the tailings of the old mill. The tailings contain, on an average, \$2 per ton in gold. The mill has been idle for the past year.

### WASHINGTON.

#### Okanogan County.

A strike of free gold ore is reported near the Poland China mine, 4 miles northwest of Chesaw, owned by W. H. Lilley. The claim is at the headwaters of Mary Ann creek—a placer stream.

#### Stevens County.

The Turk M. Co. has started to put in a 100-ton smelter in the canyon below its mines, says W. D. Martin of Spokane. The company expects it will be running by September 15th. The Turk M. Co. has eight claims in the Cedar Canyon district, 25 miles west of Springdale. Sufficient work has been done on them to show the merits of several of the claims, and some ore has been shipped. Other mines in the district are shipping ore, among them the Providence and the Queen and Seal. Ore is hauled to Springdale, Davenport or Creston for shipment. The smelter will use wood and coke for fuel, and the coke will be hauled by team for 25 miles. The Turk Co. is composed of Davenport men, the officers being A. W. Turner, H. J. Davis and H. A. P. Myers.

### WYOMING.

#### Albany County.

The New Rambler mine, near Holmes, has been merged into a new company, known as the Rambler M. & S. Co. F. M. Wooten is president and W. H. Weber superintendent. The covellite (a copper sulphide), which forms part of the ore of the New Rambler mine, is noted for containing values in platinum and palladium.

#### Carbon County.

Saratoga reports say a gold discovery has been made on Jack creek, near Saratoga, by C. P. Clemmons. Beds of gravel of unknown depth, and extending along the creek valley for several miles, have been located. The gravel is said to run \$2 in gold per ton and can be handled with a scraper.

Grand Encampment reports say 120 tons of blister copper is the weekly output of the North American Co.'s smelter there, valued at \$30,000. Every available team owned by the company and all that can be secured in the district are hauling bullion to the railroad at Walcott for

shipment to the Eastern refineries. The blast furnaces produce 50% matte, while the product of the converters is from 99.3% to 99.6% copper. The blister copper is shipped in bars weighing 250 pounds. The aerial tramway is in daily operation and is working satisfactorily. Throughout the district there is renewed activity this year.

#### Uinta County.

The Kemmerer Coal Co. has started work on construction of a coke camp at Willow Creek, a few miles west of Kemmerer, and is building houses, coke ovens and putting in a plant of machinery. This is said to be the second coke deposit in the State to be developed, the other being at Cambria in eastern Wyoming.

Kemmerer reports say the Globe Oil Co. has struck a spouter on its lands in the Fossil oil fields, and at regular intervals it throws out a large volume of water, sand, oil and gas.

## FOREIGN.

### AFRICA.

#### Transvaal.

The Board of Trade Journal of London gives the following statistics of the mineral production of the Transvaal for the year 1903:

Articles.	Total, 12 months.
Gold.....	\$61,454,439
Silver.....	178,820
Coal.....	4,272,671
Diamonds.....	1,166,754
Chemicals.....	119,570
Stone, lime, brick, etc.....	1,261,865
Total.....	\$68,454,119

The figures of the gold output since the resumption of mining operations subsequent to the war are as follows:

	Value of gold.
May to December, 1901.....	\$ 5,339,617
January to December, 1902.....	35,532,755
January to December, 1903.....	61,454,439
Total.....	\$102,326,811

A comparative statement of the production of gold, coal, diamonds and silver during the first quarters of 1904 and 1903 is also given as follows:

Articles.	Jan. 1 to Apr. 1, 1903.	Jan. 1 to Apr. 1, 1904.
Gold.....	\$12,745,758	\$18,370,960
Coal.....	966,365	1,024,861
Diamonds.....	26,392	868,617
Silver.....	41,078	52,223
Total.....	\$13,779,593	\$20,316,660

### AUSTRALIA.

#### New South Wales.

It is reported diamonds in matrix have been found in Oakley creek, which flows through the diamond-bearing belt of New South Wales.

### BRITISH COLUMBIA.

G. O. Buchanan, superintendent of Dominion lead bounties, says that up to March 31, 1904, the Canadian lead producers, who are confined to British Columbia, had earned \$121,000 in bounties. The production of metallic lead to that date was 8000 tons, as compared to 9000 tons for the whole of the fiscal year 1902-3. The bounty year closed June 30, and by that time Superintendent Buchanan estimated, the production of metallic lead would reach 15,000 tons. The last quarter of the year is thus credited with a greater average production, largely due to starting ore shipments from the St. Eugene mine at Moyie.

#### Boundary District.

The Granby M., S. & P. Co. is equipping the No. 3 and the No. 4 tunnels at the mine at Phoenix, says J. P. Graves, manager. The company has one crusher of 1000 tons capacity and is putting in two more of 1000 tons each, which will be ready for work in the fall. New ore bins are also being built to take care of the ore brought from these two tunnels.

The British Columbia C. Co. has put on a train of pack mules to take out ore for test shipments from the Rhoderick Dhu mine, in Long Lake camp. It will be placed on the cars at Eholt.

#### East Kootenay District.

The Crow's Nest Pass Coal Co. will build a branch railway from Fernie to connect its Coal Creek mines with the Great Northern R. R. extension from Morrissey to Fernie. The surveyors are at work, says Vice-president Lindsay.

Work has been resumed on the Watson group of mines on Victoria gulch, a tributary of Wild Horse creek, near Fort Steele. It is a silver-lead producer. The tunnel is being extended to open the 40-foot vein.

C. Sweeny of Spokane, Wash., says the lead smelter at the Sullivan mine at Marysville will be completed by September 1. The smelter will start with a capacity of 250 tons. It is being built for the Sullivan mine, and whether they take custom ore or not depends on the output from the Sullivan mine being suffi-

cient to keep the smelter running to full capacity.

The Fort Steele Prospector says on Wild Horse creek five companies are engaged in placer mining and 100 men, mostly Chinese, are employed. Four ditches carrying from 800 to 1500 inches of water are in use. Twenty-inch steel pipes convey water to the giants.—On Perry creek three companies are working. Near Old Town the Theis Co. is sinking another shaft to bedrock, work on the old shaft having been profitable. The Perry Creek Hydraulic M. Co. is building a flume 2 miles in length and will work bench diggings by hydraulic, commencing near the falls; while the East Kootenay P. M. Co., farther up the creek, has taken in a railway steam shovel with which to raise the gravel from bedrock, and is arranging machinery for handling the gravel between steam shovel and flume.

#### Nelson District.

For the Mount Alamo M. Co., E. J. Stratton of San Francisco, Cal., has bought the Pingree group of claims on 49 creek, near Nelson. There is said to be six claims and three ledges—two of copper-gold ore 5 feet wide and one of free-gold ore 2 feet wide. The copper-gold averages \$17 and the free-milling ore \$17.50. Men are being put to work on development.

#### Roseland District.

Concentrators at the Velvet-Portland mine, 20 miles southwest of Roseland, started July 15, says W. Thompson, consulting engineer of the company. The plant will handle fifty tons of ore a day. The ore will be concentrated and piled up to be smelted later by a small smelter which the company will put up when the concentrator is seen to work satisfactorily. This smelting plant will handle seventy-five tons a day and will be put in this fall. The ore is high-grade copper and gold, and the company formerly shipped direct to a smelter, but on account of the 12 miles of wagon haul this was found too expensive.—The Roseland-Kootenay mine at Roseland is shipping seventy tons of ore a day to the smelter. It is used for fluxing. The mine is working twenty men.

#### Vancouver Island.

G. H. Robinson of Salt Lake City, Utah, is preparing to build a 500-ton mill for the Britannia copper mine on Howe Sound, of which he is manager.

## CANADA.

The following is a summary of the mineral production of Canada in 1903:

Metallic:	
Copper.....	\$ 5,728,261
Gold, Yukon.....	12,250,000
Gold, all other.....	6,584,490
Iron ore (export).....	922,571
Pig iron from Canadian ore.....	707,838
Lead.....	762,660
Nickel.....	5,003,204
Silver.....	1,700,779
Zinc.....	48,600
Total value.....	\$33,707,403
Non-metallic:	
Arsenic.....	15,420
Asbestos (exports).....	891,038
Coal.....	15,957,946
Coke.....	1,663,725
Graphite.....	23,745
Limestone for flux.....	256,344
Mica.....	159,478
Natural gas.....	168,900
Petroleum.....	922,672
Pyrites.....	126,133
Salt.....	384,088
Miscellaneous.....	679,683
Total value.....	\$21,202,062
Total structural materials and clay products.....	8,017,945
Total non-metallic.....	\$29,219,107
Total metallic.....	33,707,403
Estimated value of mineral products not returned.....	300,000
Grand total.....	\$63,225,510

Increases over the figures for 1902 are shown by copper, gold (other than Yukon), zinc, coal, coke and salt. The principal decreases are in Yukon gold, iron and iron ore, lead and silver. As usual, gold, together with coal and coke, constitute Canada's most valuable mineral assets and account for 57.66% of the value of the whole mineral output of the country.—According to customs returns, exports of nickel in 1903 were as follows: To Great Britain, 1,335,677 pounds; United States, 11,363,470 pounds; and other countries, 80 pounds.

#### Ontario.

Deposits of cobalt were found in Ontario while projecting the new Temiscaming railway, writes U. S. Consul General Holloway at Halifax, Nova Scotia. W. Hutchinson, Canadian Commissioner, sent men to procure samples and several tons of the ore have been sent to the St. Louis Exposition. Cobalt usually occurs associated with nickel, arsenic and sulphur, and is frequently an incidental product in the working of copper, bismuth and nickel ores. Along the Temiscaming route, where the metal was discovered by chance, there were none of the usual indi-

cations of the presence of cobalt. A. E. Barlow of the Geological Survey has made investigation into the qualities of the mineral.

### MEXICO.

#### Chihuahua.

The Cia. Metalurgica de Torreon at Torreon has bonded the Diaz lead-silver properties, near the Cuchillo Parado, in eastern Chihuahua. The mines are near the Stillwell Railroad, as it is being graded eastward toward the Concho river.

Long Bros., for the Hidalgo M. Co. and other mines with which they are connected, are reported shipping 6000 tons of ore monthly out of Parral district. Parral and Santa Barbara continue to ship 20,000 tons of ore monthly to the smelters.

#### Lower California.

(Special Correspondence).—The Mendoza Con. Copper M. Co. is shipping high-grade ore from La Paz direct to San Francisco, Cal. In June were sent 125 tons, besides the free gold extracted on the plates. The July shipments will be 300 tons.

Triunfo, June 30.

#### Sonora.

(Special Correspondence).—There is little activity in mining in western Sonora at this time, though indications show that much will be accomplished the coming year. The Greene placers at Santo Domingo, near Magdalena, will increase operations; the Zubiate G. M. Co., west of Magdalena, will be worked more extensively; the San Xavier mines in eastern Hermosillo district, now idle, will resume, and with the rainy season prospectors will be in the field. Two companies, the Chas. Butters & Co., Ltd., and the Creston & Colorado Co., are operating at La Colorada (Minas Prietas), 13 miles east of Torres, where it connects with the Sonora railway by a branch narrow-gauge line, owned by F. H. Seymour, who also owns the Grand Central mine, being worked by the Butters Co. at La Colorada. The Creston-Colorado Co. has worked continuously for twenty years. The shaft is down 1100 feet and the ore from it is conveyed 1 mile to the mill by an aerial tram. A 50-drill compressor supplies power for the drills and miscellaneous work about the shaft. The company is putting in a cyanide plant designed to supersede the continuous amalgamation process. It will be ready by Sept. 1st and will have capacity of 300 tons per day. The present plant handles 200 tons per day from the mine and the tailings are cyanided. There is a battery of thirty stamps, from which the ore passes to the eight Huntington mills before going through the amalgamation tanks and settlers of the Boss process.

Adjoining the Creston-Colorado is the property of the Grand Central Co., being operated on a share system by Chas. Butters & Co., Ltd. This company employs thirty stamps and ten Huntington mills in the reduction of its ore, and the extraction is by straight cyaniding, values being precipitated from solution by electric current. About 6500 tons per month are treated. The values are silver principally, there being only a small percentage of gold. The Butters Co. originally worked the tailings dump, and when the mine was abandoned by the old company took that also, and while running on a comparatively low-grade ore reports satisfactory results. According to contract with the Minas Prietas Water Co., the company buys water at 75 cents per 1000 gallons, although at present the mine is making about 100,000 gallons per day, which goes to waste. As yet the mine has only between 500 and 600 feet depth in its double-compartment shaft. There is a hoisting plant and the ore is conveyed by aerial tram 1200 feet to the mill. The Grand Central Co. is sinking a new shaft to cut what is believed to be an extension of the Creston ledge of the adjoining company.

Magdalena, July 9.

H. P. Griswold, of Magdalena, with Sherman & Diaz, is reopening the Caballo Rosio mine, 20 miles east of Imuris.

The Lexington and Belmont claims in Moctezuma district have been sold to M. H. Speer of El Paso, Texas, for \$20,000.

#### Durango.

At Chacala, the Amazon G. M. Co. has its 100-ton smelter in full operations. The ores are said to contain, besides silver, values in gold and bismuth, with copper and lead.

Laveaga Bros. and V. Gomez, owners of mines at Animas, are building a 30-ton cyanide plant, as a change from pan amalgamation.

#### Zacatecas.

The Mesquite G. M., Ltd., an English company, has been organized to take over the mines of the Mesquite M., Ltd., near Zacatecas. J. F. McNabb is manager and is preparing for operations.

## Personal.

B. PULLIN is manager of the Mint mine near Cripple Creek, Colo.

H. K. WHEELER of Los Angeles, Cal., is reporting on Mexican properties.

V. C. OSMONT has returned from Chihuahua, Mexico, to San Francisco, Cal.

E. M. DOUGLAS, of the United States Geological Survey, is in San Francisco, Cal.

S. G. KNOTT, formerly of Boulder, Colo., is examining mines at Searchlight, Nev.

T. CLARK, manager of the River Hill mine, at Placerville, Cal., is in San Francisco, Cal.

H. BLANEY is superintendent of the Lappin mine at Deadwood, Trinity county, Cal.

B. PULLIN is manager and C. Ridpath superintendent of the Mint mine at Cripple Creek, Colo.

W. H. BREVORT, of New York City, N. Y., interested in Western mines, is in San Francisco, Cal.

JESSE SCOBEEY has gone from Guadalajara, Mexico, to report at Richmond, Va., on properties examined.

L. H. OUTZEN of Richfield, Utah, has gone to the mines of the Shasta G. & C. Co. in Shasta county, Cal.

J. A. MCINTIRE, superintendent of the South Keystone mine, near Amador City, Cal., is in San Francisco, Cal.

H. SCHAEFFER, superintendent of the Gold Hill Dev. Co., has returned to Gold Hill, Or., from Milwaukee, Wis.

W. A. SHERMAN returned to Salt Lake City, Utah, last week from a trip to Indian Territory, examining mines.

L. H. PAIGE, part owner of the Mountain Lion mine near Shasta, Cal., is at the mine from Fargo, North Dakota.

P. P. BUSH, Western manager of the Vulcan Crucible Steel Co., has returned from Aliquippa, Pa., to Denver, Colo.

F. DAVIS, manager of the Yaqui S. & R. Co. plant and properties at Toledo, Sonora, Mex., is visiting in California.

H. L. SLOSSON of Henshaw, Bulkeley & Co. has returned to San Francisco, Cal., from a trip to the mines of Virginia City, Nev.

M. D. MCCREERY has been appointed superintendent of the electric power plant of the Columbus Con. M. Co., near Alta, Utah.

HAROLD T. POWER, manager of the Mountain Gate mine, Placer county, Cal., has returned to the mines from San Francisco, Cal.

J. A. COMER, general manager of the mines in Trabucco canyon, near Santa Ana, Orange county, Cal., is in San Francisco, Cal.

F. M. GALLOWAY, of the Goldstake M. Co., returned last week to Deadwood, S. D., from Columbus, O., where he spent the winter.

W. A. PRITCHARD, manager for Bewick, Moreing & Co., at Kalgoorlie, Western Australia, has gone to London, Eng., on business.

HERMAN DAVIS, president and manager of the Nevada Reduction Works at Dayton, Nev., has returned from San Francisco, Cal.

GEO. W. MYERS, representing the Chrome Steel Works, has returned to San Francisco, Cal., from an extensive trip in Alaska.

D. W. RECKHART, formerly of Salt Lake City, Utah, has been appointed manager of copper properties near Lordsburg, New Mex.

T. H. SCHIEMANN, for the past two years underground foreman Rawhide mine, Tuolumne county, Cal., has resigned that position.

J. L. GIROUX of Los Angeles, Cal., manager of the Giroux Con. M. Co., is at the Sultana mine of the company at Copete, Sonora, Mex.

R. J. COLEMAN, president of the Lluvia de Oro M. Co., is at the gold properties of the company near El Fuerte, Sinaloa, Mex., from Denver, Colo.

J. McKINTY is superintendent of the Con. California & Virginia, Ophir and Mexican mines at Virginia City, Nev., vice J. R. Ryan, deceased.

M. A. LATHROP is superintendent of the Houghton-Thurston Co. of Boston,

Mass., operating the Providence mine, near Davenport, Lincoln county, Wash.

D. A. LYON, superintendent of the New Jersey and Zero mining companies, returned to Prescott, Ariz., last week from Duluth, Minn., where he had been on company business.

CHAS. P. POLLAK has resigned his position as Eastern representative of Wickes Brothers, Saginaw, Mich., and will enter the employ of Fairbanks, Morse & Co., Chicago, Ill.

C. B. SMITH, JR., resident engineer at Phoenix, B. C., for the Granby C. M. & P. Co. for several years, has been appointed superintendent of mining operations of the company.

E. H. STAGG, who has been manager of the Bagdad-Chase G. M. Co. at Bagdad, San Bernardino county, Cal., for five years, and also manager of the Ludlow & Southern Railway, has resigned both positions.

J. DRUMMOND, who has been in charge of the Good Hope mine at Searchlight, Nev., has gone to London, Eng., en route to Obuassi, West Africa, for the Ashanti Goldfields' Corporation, Ltd., of London.

J. K. ROMIG of Baker City, Or., has accepted the position of president and manager of the newly organized Virtue M. Dev. Co., retaining his position as general superintendent of the Sanger G. M. Co.

F. HIGGISON has been appointed acting superintendent of the Hale & Norcross mine at Virginia City, Nev., pending further action by the directors of that company to fill the vacancy caused by the death of J. R. Ryan.

W. Y. WILLIAMS, having resigned as superintendent of the Granby mines at Phoenix, B. C., has moved to Spokane, Wash., where he will make his headquarters, being retained at the same time in a consulting capacity by the Granby Con. C. M. & P. Co.

CHAS. C. CHRISTENSEN will, on the 27th inst., celebrate his twenty-fifth anniversary as mechanical engineer with Fraser & Chalmers, of Chicago, and their successors, Allis-Chalmers Co. "C. C. C." has a month's vacation and is on a pleasure trip through the West.

## Commercial Paragraphs.

THE Fulton Iron Works of San Francisco, Cal., have received orders for a 200-ton smelter, a 150-ton cyanide plant and a stamp mill for Mexico; also a stamp mill for Idaho and a hoisting and pumping plant for Arizona.

THE Gutta Percha Rubber & Manufacturing Co., 26 Fremont street, San Francisco, Cal., have placed seven of their extra heavy dredger conveying belts in the Oroville, Cal., dredging district within the last three months, none of which weighed less than 2000 pounds.

G. W. MYERS of the Chrome Steel Works, Chrome, N. J., has returned from a trip to Alaska, and reports closing a contract with the Alaska-Treadwell M. Co. for 3000 chrome steel shoes and a large tonnage of steel mill parts, which he claims is a record sale. S. C. Myers, representing G. W. Myers, is in Sierra and Nevada counties, Cal., and reports good business.

THE De Beers M. Co., Ltd., Kimberly, South Africa, have cabled an order for a third Westinghouse-Parsons steam turbine generating outfit of 1500 K.W. capacity for their power plant at Kimberly. The new turbine unit will operate at 150 pounds boiler pressure, 35° superheat and 23 inches vacuum. Taking into account the altitude of Kimberly, this would be equivalent to about 27 inches vacuum at sea level.

THE Rubber Vitalizing Co., 121 Geary street, San Francisco, Cal., has in successful operation a process to treat all rubber goods against decay and hardening from age and climatic conditions, and to vitalize old rubber goods that have lost their elasticity, thus saving users of rubber vexation and money, and giving reliability and staying qualities to all rubber commodities. They state that by the use thereof new rubber goods that have been vitalized may be kept in stock indefinitely without fear of deterioration.

A PROMINENT FEATURE of the machinery exhibits at the World's Fair is the Allis-Chalmers engine coupled to a Bullock electric generator. The engine is capable of developing 8000 H. P. when operating, condensing at 150 pounds pressure of steam, and running at seventy-five revolutions per minute. It furnishes the

electric current for the decorative lighting of the buildings and grounds, for which about 200,000 incandescent lights are required, and the Exhibition authorities often employ it for operating the cascades and general power purposes. The St. Louis Transit Co., which operates the larger part of the street car system in St. Louis, has found itself short of power ever since the World's Fair began to attract large numbers of visitors. The traction plant was working at an almost constant 50% overload, and at rush hours the excess reached extreme proportions. The railway company have now applied to the World's Fair authorities for additional power, with the result that Governor Francis and the Fair administration have, by contract, put at the service of the railway company during the day from 2 P. M. to 7 P. M., when the loads are heaviest, the service of the Allis-Chalmers engine.

## Books Received.

"The Evolution of Climates," Marsden Manson, Berkeley, Cal. This considerable contribution to what may be called the cosmic evolution of the physical world constitutes an advanced study of a branch of science that has long engaged the attention of the author, or, in other words, is an extension of several previous essays of his on correlated subjects that need not be enumerated at this time. The habit of mind that enables an investigator to delve beneath the crust and search for primary causes as well as to consider current phenomena may be called the "engineering habit," and to this fact we can attribute in the present case a careful and sequential treatment of the extensive and obscure causes and conditions that have evolved what we call climate, or to give it a broader term, the physical conditions of human environment—because climate is the ruling physical factor in our existence. Mankind exists in a narrow range of natural temperature (100° or so), but can by agencies at his control produce temperatures varying, plus and minus, fifty times as much, and such enormous changes even have a part in the industrial arts of our age. Such phenomena being therefore of an engineering nature naturally leads up to thought and investigation in the line of the present treatise. The subject lies so wholly outside of what may be called popular science, or even accepted science, that a review or criticism of the learned author's views can have no proper place in a notice such as can be given where the principal interest will center in the fact of the extended evidences of glacial action and other peculiar features afforded by the physical phenomena of the Pacific coast. Among these phenomena, those that can be especially seen and appreciated are the effects of scouring glacial action and fossiliferous remains disclosed to a considerable extent by mining exploration and also by certain active and observable or even measurable changes that indicate beyond doubt remote but unmistakable conditions. We mean the recession of glaciers and resultant alteration of the earth's surface. Such evidence is presented by the author in a graphic way by a section showing changes in the Mendenhall glacier in Alaska.

Two serious impediments for the ordinary reader limit interest in subjects such as that discussed by Mr. Manson. One is the difficulty of adapting our conception of time to the enormous periods disclosed by geological and climatic evidence. The other impediment is in connecting such research with the practical affairs of our age, a view commonly taken by those who see the utilitarian or practical side of life. The first impediment disappears by some logical effort and an examination of the elementary foundation of geology, respecting which there is no longer doubt except in branches like that treated in the present essay, such as lie outside the field of conclusive physical evidence, but it must be remembered that the views and conclusions such as here presented are not the emanations of personal opinion or conjecture, but propositions submitted to a tribunal as wide as civilization and one that comprises the highest learning to which we can attain. As to the second impediment, we seldom consider the relations of climate to industrial, economic and social affairs of life. It governs the distribution of population, the producing power of the earth, to a large extent the migration of people, and on this coast, or so much of it as lies within the "cool belt," is so important a matter as to be esteemed a basis for all that is claimed in material advancement, so that whatever gives promise of the causes that lead up to climatic phenomena should have here a special interest.

## Latest Market Reports.

SAN FRANCISCO, July 15, 1904.

## METALS.

**SILVER.**—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58c, refined (1000 fine); San Francisco, 58c; Mexican dollars, 47½c San Francisco, 45½c New York.

Copper shows no change since last week, either at home or abroad. The market is quiet and production steady and heavy. Labor troubles and litigation are at present having no influence on the output, though at times these are important factors in production, and then consequently effect the market.

**COPPER.**—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$12.87; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £57 5s spot per ton.

**LEAD.**—New York, \$4.25; Salt Lake City, \$3.50; St. Louis, \$4.25 San Francisco, \$4.50, carload lots, 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 9s 6d long ton.

**SPELTER.**—New York, \$4.95; St. Louis, \$5.00; London, £22 ½ ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

**TIN.**—New York, pig, \$25.25 @ 25.50; San Francisco, ton lots, 28c; 500 lbs., 23½c; 200 lbs., 29c; less, 29½c; bar tin, ½ lb., 30@32½c. London, £119 15s spot.

**PLATINUM.**—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

**QUICKSILVER.**—New York, \$44.50 @ 45.50, large lots; London, £8 San Francisco, local, \$43@43.50 per flask of 75 lbs.; Denver, \$46.00. Export, \$43.00@43.50.

**BABBITT METAL.**—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

**SOLDER.**—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

**ZINC.**—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c. **NICKEL.**—New York, 40@47c per lb.; ton lots, 40@47c.

**ALUMINUM.**—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

## STRUCTURAL MATERIALS.

**IRON.**—Pittsburg, Bessemer pig, \$12.60 @ 12.85; gray forge, \$12.00; San Francisco, bar, 3c per lb., 3½c in small quantities.

**STEEL.**—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @ 23.00; San Francisco, bar, 7c to 12c per lb.

No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

**CAPS.**—3x, \$5.50 per 1000; 4x, \$6.50; 5x, 8c; Lion, \$9, in lots not less than 1000.

**FUSE.**—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

**CANDLES.**—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

**CHEMICALS.**—Cyanide of potassium, 98%—99%, jobbing, 23@24c per lb.; carloads, 23@23½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1¼@2c per lb.; nitric acid, carboys, 8c per lb.

**OILS.**—Linseed, boiled, bbl., 54c; cs., 59c; raw, bbl., 54c; cs., 52c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw, bbl., 46c; cs., 48c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Spermin, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 68c; Spermin, crude, 63@68c; Natural White, 70c; Bleached, do., 80c; Whale Oil, cs., 52@57c.

**BONE ASH.**—Extra No. 1, 5@6c per lb. No. 1, 4@5c.

**RED LEAD.**—500 lbs. and over at one purchase, ½ lb., 7c; less than 500 lbs., 7½c. **LITHARGE.**—Pure, in 25-lb. bags, 8@9c per lb.

**BORAX.**—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

**MOLYBDENUM.**—Best, \$2.00 per lb.

**CHROMIUM.**—90% and over, ½ lb., 80c.

**PHOSPHORUS.**—American, ½ lb., 70c.

**SILVER.**—Chloride, ½ oz., 90c@\$1.00; nitrate, 55c.

**MERCURY.**—Bichloride, ½ lb., 77c.

**MAGNESIUM.**—Pure, N. Y., 60c.

**MANGANESE.**—½ lb., \$2.75.

**SODIUM.**—Metal, ½ lb., 50c.

**BISMUTH.**—Subnitrate, ½ lb., \$2.10.

**ALUMINUM.**—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

**URANIUM.**—Oxide, ½ lb., \$3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

**ELECTRIC TROLLEY.**—No. 764,224. J. Q. Brown, Oakland, Cal. July 5, 1904. This invention relates to improvements in overhead current collecting devices for trolley cars, and particularly for heavy multiple unit electric trains for interurban service. Such a trolley must be capable of taking a heavy current and of operating at high speed on curves as well as on a straight track, and be strong enough to withstand a tremendous lateral strain under such circumstances. It must accommodate itself to the low head room in passing under subways and must be capable of passing under crossings with regular trolley wires while the train is at full speed. The invention comprises a double diamond shaped structure made up of four pivotally connected rectangular frames, a trolley roller supported by the frames and curved lateral trolley guards disposed in a substantially vertical plane and having their upper surfaces substantially continuous with the top edge of the roller. This trolley is in use on the trains of the Key Route operated between San Francisco and Oakland and Berkeley.

**SAFETY APPLIANCE FOR SIDEWALK ELEVATORS.**—No. 764,236. M. Griffin, San Francisco, Cal. July 5, 1904. The object of this invention is to prevent accidents by reason of the operator being crushed between the elevator and the hatches which usually close the shaft of an elevator of this character. The invention consists of means operated by the opening and closing movement of the hatches to start and stop the elevator so that while

the hatches are closed the elevator cannot be moved.

**AIR SHIP.**—No. 764,198. J. D. McFarland, Fruitvale, Cal. July 5, 1904. This invention consists of a cigar-shaped body with skeleton frame work, braces and supports therefor, and an exterior covering, propeller means at the ends, and one or more propellers located on stationary shafts vertical with relation to the apparatus, these propellers having adjustable blades, engines revolvable within the propellers and connected directly with the shaft, means for supplying a propelling medium to the engines, and means for adjusting the propeller blades so that they will act to raise the apparatus into the air, or to permit them to act as aeroplanes.

## SITUATIONS WANTED.

**EXPERIENCED ASSAYER DESIRES POSITION.** Thoroughly competent in bullion, control and analytical work. Best of references. Address "Bullion," care of this office.

**EXPERT MINE FOREMAN WANTS POSITION.** Competent to handle extra difficult conditions underground. Address "Limestone," Room 602, 330 Market St., S. F.

**MANAGER OR SUPERINTENDENT FOR A** gold, silver or copper property; 20 years' experience in different parts of the country. Address "Can furnish any bond. Mexico preferred. Address D., this office.

**POSITION DESIRED AS SUPERINTENDENT** to develop or operate mine and small mill; will do own assay work; would accept part salary in stock; experienced all round man; excellent references. Address "Dividend," care of this office.

**WANTED, POSITION AS SUPERINTENDENT** of mine and mill; amalgamation and concentration; competent assayer and analyst; good references. Address "Vanner," care of this office.

**THE CALIFORNIA DEBRIS COMMISSION** having received applications to mine by hydraulic process from E. A. Moody, in Good Luck Mine, near Gold Run, Placer County, Cal., draining into Squires Creek, which reaches Bear River, and from Eagle Bar Placer Mining Co., Limited, in Eagle Bar Placer Mine, near Forest Hill, Placer County, Cal., draining into Middle Fork of American River, gives notice that meeting will be held at Room 96, Flood Building, San Francisco, Cal., Aug. 1, 1904, at 1:30 P. M.

**CYANIDE TANKS ERECTED.**—Having been engaged in erecting steel Cyanide Tanks for the past six years, and having erected tanks at the following well-known plants—Ymir, B. C., San Sebastian of C. A., Octave of Arizona, Seal of Gold of San Bernardino, Cal.—which in each instance have given perfect satisfaction, always using the labor at hand and thereby making a great saving to the company in traveling expenses for skilled labor, I am prepared to make engagements for further work. Can furnish the best of references as to ability and workmanship. Address Box 25, this office.

## New Patents.

**DEWEY, STRONG & Co.'s Scientific Press** PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING JULY 5, 1904.

764,266.—TEMPORARY BINDER—J. W. Ameath, S. F.  
764,102.—LOOSE LEAF BOOK—H. W. Ayers, Los Angeles, Cal.  
764,034.—AGRICULTURAL MACHINE—G. L. Bradley, Mayview, Wash.  
764,418.—TROLLEY—J. S. Briggs, Los Angeles, Cal.  
764,224.—TROLLEY—J. Q. Brown, Oakland, Cal.  
763,956.—INDICATOR—G. A. Browne, Tacoma, Wash.  
764,117.—PIANO SOUNDING BOARD—A. Dodd, Los Angeles, Cal.  
764,283.—IMPLEMENT—C. Ehrenfeld, Pasadena, Cal.  
764,285.—SAFETY ELEVATOR—M. Griffin, S. F.  
764,464.—ROTARY ENGINE—C. Hendricks, Riverside, Cal.  
764,465.—ROTARY ENGINE—C. Hendricks, Riverside, Cal.  
764,181.—HEATER—H. F. Hoesman, San Jose, Cal.  
763,937.—ROTARY ENGINE—J. Jahn Jr., Riverside, Cal.  
764,581.—GENERATOR—J. M. Kroyer, Stockton, Cal.  
763,989.—POWER APPARATUS—H. Laughlin Jr., Los Angeles, Cal.  
764,060.—PENHOLDER—L. Lemos, S. F.  
764,249.—LOCK—A. F. Mayer, S. F.  
764,037.—ROTARY ENGINE—C. A. McCallister, Seattle, Wash.  
764,198.—AIRSHIP—J. D. McFarland Jr., Fruitvale, Cal.  
764,197.—CONCENTRATOR—C. H. Muhleman, Los Angeles, Cal.  
764,000.—DOOR SCREEN—Newell & Schuyler, Los Angeles, Cal.  
764,072.—KINDLING—Perry & Dickson, Tacoma, Wash.  
764,205.—HARVESTER—A. D. Reynolds, S. F.  
764,500.—MATTRESS FILLING MACHINE—F. A. Rice, S. F.  
764,150.—DRIER—J. A. Ridings, Marquand, Or.  
764,305.—SASHHOLDER—J. L. Rivers, S. F.  
764,083.—PRINTING PLATES—W. G. Thorpe, Los Angeles, Cal.  
764,165.—RAILROAD SWITCH—Troutman & Gonzales, Los Angeles, Cal.  
764,403.—WATER MOTOR—M. H. White, Everett, Wash.  
764,092.—LEVEL—J. L. Wilcox, Seattle, Wash.

## HELP WANTED.

**WANTED—MINING SUPERINTENDENT,** M. E. preferred, to take full charge of a California gold mine. Must be capable of installing a 40-stamp mill, and be familiar with the Mother Lode ores. Liberal salary to right man. Address, giving references and full particulars as to ability and experience, Box 2427, Boston, Mass.

## Treatment of Cripple Creek Ores.

In the Cripple Creek, Colo., district there are few mining companies owning their own reduction plant. The ores of the district are mostly gold, and are shipped either to smelters or to one of the several cyanide or chlorination mills in the cities of the district or to those lying but a few miles distant, as at Florence, Colorado City, or Canyon City. A large amount of the rock hoisted from the mines of the Cripple Creek district is washed and screened, the finer material in many cases carrying the higher values, the coarse rock being low grade or worthless. This process

cost of mining and transportation. The capacity of the plant is 325 tons per day. It is at present treating the ores of the United Gold Mines Co., the Gold Coin and other properties under that management, and also the ores sent in by the lessees on those properties. Railroad spur tracks are now run to convenient points at the works, and by the extensive system of switches and sidings ore can be delivered from a large number of mines in the district.

THE description of the rock formations and the physical conditions under which the gold deposits of Kalgoorlie and Coolgardie in Western Aus-

AT Bisbee, Ariz., the ore deposits are very irregular in size and shape, and as they have none of the characteristics of fissure veins, the extralateral right is a matter of serious consideration. In view of the difficulty in arriving at a satisfactory adjustment of this problem, and to avoid possible expensive and interminable litigation, the mine owners of that district some time since by mutual understanding agreed to waive the privilege of following their ore bodies beyond the boundaries of their claims extended downward. In Leadville, Colo., during the long continued and expensive litigation in that district during the early period of its history, the juries

Mill of the Economic Gold Extraction Co., Near Victor, Teller County, Colo.

greatly reduces the tonnage to be treated in the reduction works, as compared with the ore hoisted from the mines. The highest grade ore is usually shipped to the smelters, the lower grade going to the works employing wet processes. Among the latter mills is that of the Economic Gold Extraction Co., which is shown in the accompanying illustration. It is the largest reduction works in the Cripple Creek district. The plant is so arranged as to operate, as far as possible, automatically, and consists of crushers, rolls, roasters, coolers and filters. Crude petroleum is used in the roasting furnaces. The chlorination process is being employed, the cost of treatment being such that ore carrying but \$8 per ton is said to be worked at a profit, including the

tralia occur, and which appears elsewhere herein, should interest those whose conception of a gold-bearing lode is "a mass of white quartz with well defined walls." In the Western Australia region the gold-bearing ore is greenstone, more or less altered to chlorite schist—a rock which on the Bendigo fields is known as mullock (waste), and is thrown away. This indicates how necessary it is for those who search for mineral veins to cast aside all prejudice and to critically examine everything in the way of a rock which they find.

A JURY at Rossland, B. C., has found a verdict for damages in the sum of \$12,500 against the Western Federation of Miners, on the ground that the Federation employed illegal methods in the conduct of a recent strike at the Center Star mine at Rossland. This is said to be the first verdict of the kind ever secured in the Dominion, and is looked upon as probably assuming international importance.

before which the cases were tried invariably found that there were no "lodes" in the district, and, consequently, no extralateral rights, as an apex is a pre-requisite to the exercise of this privilege. This became the unwritten law of Leadville district. As far as known, these two districts, Bisbee and Leadville, are the only ones in the United States in which the mines have no extralateral rights.

THE falling of the market price of a mining stock in a prominent stock exchange under the influence of dividends regularly and continuously declared is a peculiar feature of one Western stock. That this is due to the cool calculation that each dividend paid from the proceeds of mining means that one less remains to be paid, can scarcely be believed. Those who do their mining in the stock exchanges are rarely credited with this amount of practical sense in valuing mining stock. Evidently the stock is considered as having only speculative value.

IN discussing the large capital expenditure now necessary in the equipment of the deep-deep level mines of the Rand in South Africa, where an investment of from two to three millions of dollars is necessary, and extending over a period of five to seven years, an English engineer made the statement a short time since, that this could scarcely be considered an important factor in the economics of any of the very deep mines. That large capital expenditure and interest charges were matters of really small consideration owing to the fact that in few instances those who first subscribe for the stock of these mines, making the great expense in development and equipment possible, "rarely stay in to the finish," their places being taken by those who pick up the stock in the open market after the enterprise has been in existence for several years, and when the original investors are usually anxious to get out at almost any reasonable sacrifice.

IN view of the prevailing low price of crude oil at the wells in the Kern county field in California, independent producers are arranging to unite in an effort to secure a better price. It is said the Standard Oil Co. has been paying 15 cents per barrel and the combination known as the "Associated" has paid 17½ cents when compelled to, in order to fill contracts they are unable to meet from the output of their own wells. The price of crude oil on the Pacific coast has had a wide range, although the fall of price in the region of production has not seen a correspondingly low price to consumers in the cities and at the mines. Whether the proposed pool of the independent producers will result in raising the price to the consumer should it go into effect remains to be seen.

## Practice as Necessary as Theory.

The State School of Mines of New Mexico has made somewhat of an innovation in securing a mine, the Torrance, in the Socorro mountains, in Socorro county, New Mexico, for the purpose of giving the students of that institution an opportunity for practical experience in mining. The mining schools usually advise their students to go into the mines during the summer season, and this has been the custom with the greater number of universities and mining colleges, but the New Mexico School of Mines has adopted a plan which will insure each of the students of that institution having an opportunity to gain the desired experience in actual mining, whether the result proves a financial success or not. While the profit and loss aspect of the proposition is a consideration of importance, it is overshadowed by the result to the student in the gaining of a practical as well as a theoretical knowledge of his chosen profession. Most other mining schools are obliged to take or send their students to mines at a greater or less distance to acquire the practical experience which cannot be gained at home. The only advantage which this course possesses is in the variety of mines the student has an opportunity to see and to work in, but a similar opportunity is open to the student from the New Mexican school, while the fact that the school owns a mine makes it possible for the students to work under instruction, which is not usually a condition of their employment in mines where they go singly or in pairs to take their chances in securing employment, and in doing whatever may be required to be done in the best manner suggested by their good sense, and without any particular instruction or advice. The superintendents and foremen of the mines where students are given employment rarely take a greater interest in their welfare than in that of any other men about the works, and in fact, in some places students are placed at a disadvantage, owing to petty jealousies and other unreasonable causes. For this reason some students conceal the fact that they are from a mining college, preferring to take their chances with the majority, and in this way they get along quite as well, if not better, than they would otherwise. A man who starts to work at any trade can make better progress under competent direction with an advisor who takes a kindly interest in his advancement than if he were left wholly to himself. Of course, this cannot continue always, for the young miner must be taught self-reliance, and must be required to take the initiative in many things before he has been many months in the mine. However, in a case where the mining school controls the property and the commercial phase is subordinate to result to the students, opportunities are afforded which do not obtain under the usual conditions about mines. This is particularly the case in regard to mine surveying, timbering, track laying, and the numerous small things in mining which, though insignificant as compared with the whole, are important and should be well done. The New Mexico Mining School has set an example which may be followed by other similar institutions with advantage.

IN the surface equipment of mines it is not an uncommon thing to find the hoisting machinery and head frame over the shaft all under a single roof, and occasionally the mill also is located in the same building. Without doubt this is economical and convenient, but there are other important considerations than those of economy, and mine surface equipment arranged as described may eventually prove to be a disadvantage. This is particularly pronounced in case of a fire, when if it is not promptly extinguished it is almost inevitable that the entire surface plant will be consumed. This was evidenced a few days since at Virginia City, Nevada, when the Union shaft building took fire and was completely destroyed with its machinery. Within this building, which was constructed in the form of a right-angled cross, and of large dimensions, was the hoisting machinery, the pumps, carpenter shop, timber frame room, change room, compressor, and in fact the entire elaborate surface mine equipment. The structure stood directly over a vertical shaft 2000 feet or more deep. Had these buildings been built of steel, with iron roof and sides, the fire would not have been so destructive. At many mines the cost of steel struc-

tures is considered too great, and the mine buildings and head frames are built of wood throughout, and in such cases the most efficient means to avert complete disaster in case of fire is the separation of the several buildings, containing hoist, compressors, etc., and particularly is it desirable to keep the head frame apart from all other structures, as there lies the danger of communicating the fire to the mine timbers, which may result in damage more expensive and troublesome than the reconstruction of surface plant. Every mine should be well supplied with apparatus to extinguish fires, as often it is difficult to raise men from a mine when the surface works are burning.

## The Cost of Power.

The cost of power is one of the principal items of expense in mining regions. A mine having a hoist on a shaft 1000 feet deep, with air compressor for say six drills, and a mill equipment of forty stamps and accessories, usually requires not less than 300 H. P., and often more, though in dry mines considerably less is permissible. The cost of this power ranges from the relatively low price of \$1 per horse power per month to over \$8, and in isolated regions to even more than \$10. In the first instance, to secure the low cost of \$1 per horse power the company must own a water right, and then the cost is merely that of maintenance; but if power must be purchased from a distributing company, whether water or electric, the price is likely to be regulated by the cost of generating power by other means—for instance, by steam, with either wood or coal for fuel. In such cases the cost of power from the distributing company will be slightly less than the cost of power by steam. In some regions competition is an important factor in favor of the miner, but in these days of centralization of interests competitive companies quickly arrange any condition detrimental to their interests. There is still abundant power available in the mountain region of the West—in Colorado, Montana, Idaho, Washington, Oregon, Nevada and California—all that is necessary being its appropriation. The mountain streams may be used again and again. The impact wheel under high head, and the turbine under low head, may be found in many regions, operating successfully and inexpensively. Crude petroleum has become an important factor in the power problem in some districts, but as the petroleum fields are usually at a greater or less distance from the mines, the cost of transporting oil is considerable. Still, with oil at \$1.50 per barrel laid down at the mine, and with a proper oil-burning equipment, the cost should not exceed \$5 per month per horse power, and in some plants is even less than this amount.

ONCE more miners have shown the staunch material of which men who follow that fascinating pursuit are made. At the Union mine in Virginia City, Nev., the hoisting plant of which burned last week, several miners entered a drain tunnel on the 20th inst., which had been bulkheaded at the time of the fire, and removed the bulkhead. Some of the workmen ventured beyond the bulkhead to examine the workings with a view of ascertaining the amount of damage done to the shaft and were overcome by carbon dioxide, the result of the recent fire. The miners remaining near the portal of the tunnel, hearing a faint call, rushed into the deadly gas to rescue their comrades, one of whom, at least, was completely overcome and was dead when they reached him. The other survived, but is still in a precarious condition. The rescuers are also very sick men as the result of their experience. They knew what to expect before entering the mine, though this knowledge did not deter them a moment, but such instances of self-sacrificing heroism are not uncommon in mining experience.

A NOVEL FEATURE was introduced into mining a few days since when a professional diver was employed by the management of the Draper mine at Soulsbyville, Cal., to go down into the mine and, under 100 feet of water accumulated in the shaft, make repairs on the pump, which had been submerged and could not be started. The diver successfully accomplished his mission and when he reached the surface the pump was in operation.

## CONCENTRATES.

THE intensity of an electric current is measured by the "volt," which is the unit of electro-motive force. It is a word derived from the name of a noted electrician—Volta.

GRIZZLIES, constructed so that the spaces between the bars are somewhat wider at the lower end than at the top, will clear themselves much more readily than those spaced a uniform distance from top to bottom.

ORE deposits in massive rocks, such as granite, diorite, andesite, felsite, quartz porphyry, or in heavy-bedded sedimentary rocks, are not extensive unless these rocks have been fractured and crushed, and the mineralization is usually co-extensive with the zones of crushing.

REELS have several advantages over drums, in that the flat rope can be run direct to the sheave and is relieved of the travel incident to drums; the reel hoist occupies less floor space, and starts the load from depth with the minimum of power required.

THE occurrence of garnets near the contact of limestone is not an uncommon feature in connection with copper deposits, but the occurrence of garnets, tremolite or the other minerals which are the result of contact metamorphism, are not a reliable index of the amount of ore which may be discovered, for these minerals occur abundantly where there is no ore of any kind.

JUDGING by the past action of the courts, it is not likely that an attempt to forfeit a claim for failure to record notice of assessment work would be sustained, but to guard against such contingency the claim owner should comply with the local or State laws requiring such record, otherwise it may result in giving him much subsequent trouble, particularly if the mine prove to be a rich one.

THE rocks in which copper deposits occur are of many kinds. The deposits of Butte, Mont., are in granite; those of Bisbee, Ariz., are in limestone; those of Cananea, Mexico, are in limestone and eruptive rock; those of Iron Mountain, Shasta county, Cal., in quartz-porphyry; those of central California are in amphibolite schist. Many copper deposits are found in mica schist, and some in sandstone and others in quartzite.

IN shaft sinking it is always advisable to make a "cut"—that is, drill a double line of holes which are pointed toward each other. This blasted first removes a "Y" shaped rock section and greatly facilitates the blasting of the remainder of the rock in the shaft. This applies with equal force to drifting. The stratification and general "lay" of the rock in place must determine the proper location for the cut holes, their direction and depth.

THE State laws of California do not require the owner of a mining claim under bond to an individual or a company to post a notice disclaiming all responsibility for debts contracted by the operators, but this method is usually resorted to by the owners of property which is bonded to others, to prevent the attachment of the property in case debts are incurred by the operators of the claim.

IN only a few instances has it been found possible to treat successfully auriferous pyrite from concentrating machines by the cyanide, though numerous cases are of record where the slimed pyrite, such as that obtained from canvas tables, has been treated with a high percentage extraction. In the treatment of raw sulphides the chloro-cyanide or bromo-cyanide solutions appear to give more satisfactory results than those obtained by straight cyanide.

COPPER ORES not infrequently occur in quartzite, and the usual indication is an iron outcrop when no copper ore is seen in the croppings. The fact that copper ore is found in sinking is a favorable indication, but it would be unwise to declare it a positive indication. It would be well to test the dike in one place—the most favorable that can be found. A very little copper will stain a large surface of rock, and these copper blossoms are sometimes misleading.

WHEN running a tunnel through bedrock to cut an ancient river channel, or to drain a modern stream, it is most important that the tunnel be located sufficiently low to be at least as low as the bedrock, and it is preferable to be below it, to equalize any inequalities in the bedrock grade. A great many tunnels run to open and drain ancient gravel channels in California have been found, too late, to have been run too high for the purpose for which they were intended.

PLACER LOCATIONS must conform to the lines of the United States surveys where the land has been surveyed. For this purpose a tract of land may be subdivided into squares containing ten acres each, two of which constitute a single claim or location. A ten-acre tract measures 660 feet on either side, making a twenty-acre placer claim 660 feet wide and 1320 feet in length. In some districts the local laws reduce the size of a claim

to less than this amount, but no local laws can make a claim larger than twenty acres.

THE discoloration of amalgamated plates in mills is sometimes due to the minerals in solution in the battery water. Mine water is sometimes used in batteries, and there are numerous soluble mineral salts in the water which affect plates. Arsenic is one of the most objectionable. An ore which did not readily amalgamate in a mill where the mine water was used, being taken to another mill where pure water was available, was found to yield its gold readily to the ordinary method of plate amalgamation.

IN the case of A, who owns all of one claim and having a half interest in A. B. 2 and A. B. 3, A has the extralateral right on the 500 feet of branching vein, extending from the end line between A. 1 and A. B. 2, or to the point where this branch passes out of the side line of A. 1. This right would be defined on the south by a plane drawn downward and in the direction of the dip (in this case west) along the end line between A. 1 and A. B. 2., and on the north by a plane parallel to the first and passing through the side line of A. 1 at the point where the vein crosses the side line.

SILVER can best be recovered from gray copper and similar ores by smelting. The argentiferous gray copper is fused with three times its weight of lead, and pouring this alloy into moulds, forms flat cakes. These are subsequently treated in a reverberatory, the heat being so regulated that the lead, which melts first, flows away as a molten liquid carrying with it the silver which was originally associated with the copper ore, leaving the latter as a porous mass having the form of the original cake, but devoid of the silver—the lead and silver being separated by cupellation.

WHERE chromic iron occurs disseminated in grains in serpentine, and for this reason is too low grade to work, the ore may be crushed by rolls and the chrome concentrated in the usual way, on any one of the numerous concentrating devices now on the market. If water is abundant it may be rudely concentrated in sluices, the chrome being heavy will settle in the riffles and the gangue will be carried away by the current of water. By this latter method there is always considerable loss, as the water current which will wash out the coarse gangue will also carry away finely divided chromic iron.

FOR the purpose of carrying electric wires the most economical tower construction is one in which the spread of the legs at the ground is about one-quarter to one-third the height of the tower. If a less spread is used, the weight of the legs becomes excessive and with a greater spread the cross-bracing must be much increased in size. For a single circuit the common windmill tower construction in which the legs are locked together at the top has the advantage of reducing the strains to a simple compression of the legs on one side and tension on the other, the only function of the cross-bracing being to prevent the legs buckling when in compression.

THE function of the "bridge" in mine timbering is to admit of driving lagging in loose ground without too much waste of time, and the cutting away of an unnecessary amount of ground. By the use of the bridge ground may be drifted, crosscut and sunk through, which cannot be very well handled in any other manner at anything like the same cost. The placing of bridges in shaft sets is not warranted if the ground will stand well without driving lagging. In loose, soft ground which stands fairly well, lagging may often be driven without the employment of the bridge, by inserting the forward ends of the lagging between the ends of the last set of lagging and the timbers of the drift or shaft set.

DIP and strike in veins are terms employed to denote the direction of the vein downward, or its departure from a horizontal position, and strike is the direction along its course. These two directions are theoretically at right angles to each other, though both strike and dip of a vein may change frequently. The outcrop of a vein may not represent its true strike; but when a claim is located, it must be laid out along its outcrop, and not in the direction of its "true" strike. Judge Beatty has thus defined strike and dip: "The strike or course of a vein is determined by a horizontal line drawn between its extremities at that depth at which it attains its greatest longitudinal extent. The dip of a vein is its course downward at right angles to its strike."

NO PERSON can legally hold mining locations year after year without doing the annual assessment work required by law, and the repeated relocation of claims on each succeeding January 1st is only a subterfuge and will not be upheld by the courts. The timely resumption of work may prevent the relocation of the claim by another, but having been commenced, the claim holder must complete the assessment work without delay to protect his claim against relocation. He cannot go upon the claim and work a day or two, then wait a week or a month to resume operations, and in this leisurely manner perform the work. The Federal statute requires that \$100 worth of work be performed within the year following the first of January next succeeding the date of location, and \$100 worth each year thereafter, until patent is obtained. If a located a claim January 1, 1901, the law (in the absence of State or local laws re-

quiring certain work and other acts to be performed as part of the act of location) permits him to allow the claim to remain idle throughout the year 1901, and he may allow the work to remain unperformed until the night of December 31, 1902, practically two years. If he has not commenced work at that time the claim is subject to relocation. If he does the work at that time it will hold the claim until December 31, 1903, and so on from year to year.

NO PARTICULAR mineral formation is without its ore deposits and mineral veins. From the Archæan to the recent, every geological formation is mineral bearing. The Homestake mines of South Dakota are in Archæan schists, the Lower Silurian (Cambrian) in the Black Hills carries valuable gold and silver ores; in Utah the Devonian carries rich silver-lead deposits; in numerous places Carboniferous limestones are ore bearing; the Permian formation in many places carries ores of silver and copper, notably in Russia; the Triassic is also gold bearing in Colorado; the mother lode of California is associated with the Jurassic; the Cretaceous is not without its ore bodies, and the Tertiary rocks also carry ores of gold, silver and lead. The andesites, trachytes and rhyolites of Tertiary age are noted as bearers of rich mineral veins. In the late Tertiary are the ancient golden rivers and in the recent formations are found the gold placers. No formation should be condemned as unproductive without investigation.

IT has been held in a uniform line of decisions by the United States Land Department that mineral lands do not pass to the State under school grants. Some of the grants expressly stated that mineral lands were excepted. After the surveys of the public domain have been made and approved, the title to the sixteenth and thirty-sixth sections in each township "vests absolutely in the State, by virtue of the survey. The Government does not certify or patent sixteenth or thirty-sixth sections to the States." The status of the lands must be fixed by a survey for identification (as to location, etc.) before title passes to the State. If this takes place prior to the admission of a State into the Union, the grant of the school sections does not take effect till date of admission. If, at date of approval of survey, the lands are not known to be mineral, the State obtains title thereto, and it has been ruled in a number of cases that "discovery of minerals on such lands subsequent to such approval does not defeat the title of the State," nor will the subsequent exhaustion of the mineral values revert title in the State. Lands valuable for petroleum are held to be "mineral," and may be taken up under the placer mining regulations.

IN extracting silver from its ores by amalgamation in either the pan, barrel, or patio process, the loss of mercury is partly due to mechanical and partly to chemical causes; in the former case it escapes as minute globules of metal, in the latter it is stated by most authorities to be in the form of mercurous chloride or calomel (HgCl), but more or less mercuric sulphide is often formed and possibly also some sulphate or oxide. In the pan process, in presence of metallic iron or cuprous chloride, the formation of mercurous chloride is probably reduced to a minimum. According to Dr. Percy (Metallurgy of Gold and Silver, vol. I p. 635), it was assumed at Zacatecas that in the patio process the mercury chemically lost (consumido) was equal in weight to the silver recovered, the remainder being taken as mechanically lost (perdido). The total loss appears from his figures to have been from 1.5 up to over 2 parts by weight of mercury for one part of silver. The chemical reactions involved have been studied by numerous investigators, who differ widely in their conclusions. The results of most of the older workers are to be found in Dr. Percy's Metallurgy of Gold and Silver and in Eissler's Metallurgy of Silver; among the more recent publications on the subject are papers by Ortega & Bustamante in Trans. Am. I. M. E. and by Drucker in the California Journal of Technology, vol. 3, No. 3, p. 150, which was republished in the MINING AND SCIENTIFIC PRESS June 11, 18 and 25, 1904. It is well known that metallic mercury slowly oxidizes when exposed to air, becoming coated with a film of oxide, and this action no doubt goes on with the floured metallic quicksilver in tailings piles, resulting in the formation of oxide and probably of chloride. Mercuric sulphide and metallic mercury are for practical purposes insoluble in cyanide solutions, though the metal does very slowly dissolve in presence of air. Mercuric oxide and chloride dissolve completely in cyanide solutions:

$$\text{HgO} + 4\text{KCy} + \text{H}_2\text{O} = \text{K}_2\text{HgCy}_4 + 2\text{KOH},$$
but when mercurous oxide or chloride is treated with potassium cyanide one-half of the mercury remains insoluble in the metallic state:

$$2\text{HgCl} + 4\text{KCy} = \text{Hg} + \text{K}_2\text{HgCy}_2,$$
potassium mercuric cyanide passing into solution in each case. Therefore in a tailings pile containing mercury as mercurous chloride one could not expect to extract as much as 50% of the mercury by cyaniding, while the sulphide and floured quicksilver would give a less yield. Sweetland (MINING AND SCIENTIFIC PRESS May 21, 1904) states that Comstock tailings only yielded one-third of the contained mercury in six days. If the floured quicksilver and mercurous chloride are separated from tailings by panning the latter may be recognized by turning black when treated with ammonia.

## Mining Conditions on the Comstock Lode, Nevada.

[WRITTEN BY A STAFF CORRESPONDENT.]

The present condition of the mining industry on the Comstock lode at Virginia City and vicinity, in Nevada, shows some signs of substantial improvement. Three or four years ago the lode was dead when viewed from a practical standpoint, almost every mine along its entire length of over 20,000 feet being idle. Since that time, however, a noticeable change has taken place, and there are to-day a number of active mines, with a promising outlook for an increase in the number of operating mines, and consequently the employment of more men. Some of the great old mine buildings which were falling rapidly into decay and perpetual uselessness have been cleaned up, repaired and painted and the machinery overhauled and active work resumed in the shafts. One of the great misfortunes of the lode is the almost criminal carelessness shown in allowing great shafts (down 3000 feet and over several of which cost millions of dollars each to sink) to cave and become complete wrecks, thus destroying every reasonable hope that work will ever be resumed in them, and some of these shafts had most encouraging prospects at the lowest levels. As an instance may be mentioned the new Yellow Jacket shaft, over 3000 feet deep and in good ore, but which was abandoned when a flood of hot water rushing into the levels from the Exchequer north heading flooded the Jacket shaft so rapidly that it was with difficulty the men below escaped with their lives. After that the shaft was abandoned and in time the heavy machinery was removed and sent to Butte City, Mont. The massive masonry foundations still stand, though some of the retaining walls nearest the shaft are toppling over and will soon fall into the conical depression that marks the site of the collar of this once magnificent shaft. This is the result of carelessness, for had a perforated pipe been laid around the collar of the shaft and a small amount of water been allowed to fall upon the timbers they could have been kept wet from top to bottom, and the probability is the shaft would still be open and in good condition to-day. Whether the shaft will ever be reopened it is impossible to say, as it looks now, probably not. Yet two years ago the Ward shaft of the Bullion mine at Gold Hill was caved, the hoist building falling down and the machinery looked as though it was fit for nothing better than the junk pile. To-day the vicinity of the Ward shaft looks as neat and prosperous as in the Bonanza days. The building has been braced up, cleaned and the entire surface works overhauled. The engines were found in good condition despite their years of idleness, and the shaft has been recovered and is now in first-class condition to the 1700 level. A large compressor plant is being put in for operating drills and to raise water from the bottom of the mine to the Sutro tunnel level by the method known as the air lift. What has occurred at the Ward shaft may be the good fortune of any one of the old abandoned shafts on the lode.

Beginning at the north end of the lode a crosscut is being driven in the Utah mine on the 600 level. J. H. Kinkead is superintendent. The Sierra Nevada and Mexican mines are connected with the Union shaft, through which they are to be operated. East of the Union lies the Scorpion, in which prospecting was being vigorously prosecuted on the 1600 level, being also worked through the Union shaft. The Union had been overhauled and placed in good condition and extensive development planned, but the burning of the works on the 14th inst. has put a stop for the time being to all this work. At the Union shaft was at one time some of the heaviest pumping machinery in the world. The great Cornish pump with a stroke nearly 9 feet long and a pump rod 18 inches square and 3000 feet long was one of the heaviest on the Comstock. Previous to the fire referred to, this pumping machinery was being dismantled and broken up to be recast into machinery of modern design. The Sierra Nevada, Union and Mexican are in charge of Superintendent A. J. McDonnell, the operations in the Scorpion are under direction of J. H. Kinkead. The Ophir mine, one of the noted properties of early days, and the one upon which the original discovery which caused the "rush to Washoe" was made, is being worked on the 1800, 1900 and 2000 levels and stoping is in progress on a vein of good ore from which about \$250,000 has recently been paid in dividends. In the Con. Virginia and California the water is down below the 2350 level and is easily held there by the hydraulic lift which raises it to the 2150, from which the large electrically driven Riedler pumps lift it to the level of the Sutro tunnel at 1750 feet. Considerable prospecting work is in progress. It is the intention to unwater the shaft to the bottom, about 2500 feet below the surface. James McKinty is superintendent. The enormous dumps about the various mines of Virginia City and Gold Hill are an attractive and impressive feature of the landscape. These dumps are mostly of light color, a tawny yellow being the prevailing tint. Some of them are gray and a few streaked with light green, where the

"propylite," as the meta-andesite is called in that camp, has been thrown out. Some of these dumps contain over a million tons of rock, and in a few of them are many thousands of tons of low-grade ore. Others represent the waste taken from the deep shafts sunk through the barren hanging-wall country. Of such is the Combination or Requa shaft, sunk jointly by the Chollar-Potosi, Hale & Norcross and Savage Cos. This is one of the few shafts still open to the Sutro tunnel level. Among the dumps containing values are those of the Con. Virginia & California. Upon these J. H. Kinkead has a lease, and he is milling about seventy-five tons daily in Kinkead mills, concentrating the sulphides, which are shipped to Selby. Custom ores are also treated at the Kinkead mill. The mill has six heads and six 6-foot vanners. Ores from the surface workings are amalgamated on plates and concentrated subsequently.

Recently the Best & Belcher Co. built a 75-ton plant equipped with Kinkead mills, five of which are set to 20 mesh, the pulp passing from these to two similar mills with 40-mesh screen. The mill has been leased to the C. Butters Co.

At the Gould & Curry nothing is at present being done. The intention is to reopen the Savage, Gould & Curry, Chollar-Potosi, Bullion, Alpha and Exchequer through the Ward shaft of the Bullion mine, to which reference has previously been made. This group of mines is under the general direction of Leon M. Hall.

The Imperial, Challenge, Confidence and Yellow Jacket are operated in a small way through the old Yellow Jacket shaft. Some prospecting is also being done in Belcher and Crown Point through the Belcher shaft. W. E. Sharon is superintendent. He also has charge of the Overman and Caledonia. These two mines are worked through the Overman shaft and ore is being broken on the 1200 level. American Flat, once a prosperous little city of several thousand inhabitants, has been absolutely dead for years. The heavy machinery and buildings have all been removed, the shafts allowed to cave and the outlook for a prosperous future is not bright.

On the Silver City branch of the lode there is considerable activity, though mostly in a small way. The most important mines on this branch are the Justice, Silver Hill, Dayton and Kossuth. The Justice and Silver Hill are working and several small properties are being exploited for rich surface ores in the vicinity of Silver City, mostly under the leasing system. The methods are primitive both at the mines and works, where the ore is treated. These methods are the lingering customs of bonanza days, when expense was not given the consideration it now receives. It is strange that if a leaser can make money by mining in a "hand-to-mouth" fashion handling the ore with shovels half a dozen times, and sometimes even a greater number, that he does not more closely observe the trend of the times toward lessening labor and cheapening production in every possible way, but this is not the way of the average old-time Comstocker.

In Six-Mile canyon the large plant built by the Charles Butters Co. of London to treat the tailings pile near the mill is idle. It has been found, so it is stated by representatives of the company, difficult to get a satisfactory extraction of silver, and as the values in the tailings are largely silver, the proposition has not proven a success as yet. The most recent installation at this mill is a large electric plant, to be used in connection with electrolytic deposition of the values from the solutions, but unless the values can be extracted from the ores this process cannot be employed more successfully than the ordinary zinc precipitation. The plant is extensive and contains seemingly every essential device for the successful operation of the process, but on investigation one is led to the conclusion that the mistake of insufficient preliminary testing has been made.

Several small cyanide plants were seen in Six-Mile canyon and in Gold canyon and the remains of one on the Carson river. Generally speaking, these plants have not been successful, probably partly due to the fact that the tailings which most of them treat have been worked and reworked until the values contained are too low to afford a profit under the existing metallurgical difficulties. Near Dayton a plant is in operation in which the chloro-cyanide process is said to operate satisfactorily. This plant is run for most part on ores and not on tailings.

### The Freakish Assay Balance.

TO THE EDITOR:—I have just read with interest the letter from John Randall in the MINING AND SCIENTIFIC PRESS of the 2nd inst., giving an account of the erratic behavior of an assay balance and the results of his experiments that tended to indicate the influence of magnetic currents.

I first observed this "freakish trait" in a balance in southern Arizona twenty years ago, and have met with it a number of times since, but after the second encounter it had no terrors. There is no necessity for leaving the balance alone and waiting until the next day for it to come out all right. The cause of the trouble is static electricity in the case, and this may be readily or quickly discharged by passing a wet or damp cloth over the outside of each piece of

glass in the case, including the base, if of glass. The cloth should be held in the hand with the wet part in contact with the fingers at the same time as with the glass, the discharge taking place through the body. The same result is attained by passing the wetted finger tips over the glass, but obviously the use of a clean cloth or sponge is preferable.

It is probable that a brisk rubbing of the glass in the case with a dry cloth will produce the condition referred to; but, as many an assayer can testify, it will occur at times without any such encouragement or assistance. When this condition occurs the balance may be otherwise in perfect order, but will positively refuse to work; generally the pointer will swing a short distance to one side or the other and then stop and refuse to swing back, and if the rider be moved several divisions on the beam the pointer will still swing to the same place and remain there. There are other manifestations, but I think this is the most general.

As the experiment described by Mr. Randall was made after the balance became "calm," it is evident that the slight polarity noted in the pointer was not the cause of the previous freakishness. I have never known the wet cloth remedy fail to put a balance right at once when it exhibited the traits referred to by Mr. Randall. G. H. B.

### Zinc and Lead Deposits of North Arkansas.

A lead and zinc producing region of increasing economic importance is described in Professional Paper No. 24, recently published by the United States Geological Survey for gratuitous distribution. The author of the paper, which is entitled "Zinc and Lead Deposits of Northern Arkansas," is G. I. Adams, who was assisted by A. H. Perdue of the University of Arkansas, and E. F. Burchard and E. O. Ulrich, who spent two weeks in the field collecting fossils and studying the rocks, adds a chapter on "the determination and correlation of formations."

This report covers the whole of the Yellville quadrangle, of which a geologic folio is in preparation, together with portions of three adjacent quadrangles. It embraces Marion county and parts of Searcy, Boone and Newton counties. The stage of development of the field is such that the report is in a sense a preliminary one, as few of the ore bodies have been worked sufficiently to determine their extent. There are many openings and prospects, but few producing mines. Besides describing these mines and prospects, Dr. Adams discusses in detail the geological occurrences and origin of the various deposits, so that the paper will be of interest to both miner and geologist. Twenty-seven illustrations add to the value of the report.

The principal ores of this district are zinc sulphide (sphalerite), and lead sulphide (galena). The zinc sulphide, which is commonly called blende or "jack," is composed, theoretically, of 67% of zinc and 33% of sulphur. By analyses, specimens of this ore from northern Arkansas averages close to 66% of metal, but the ore as marketed is not always this pure, for when it is cleaned it is impossible to completely separate from it all other mineral matter. Lead sulphide occurs in well-defined crystals showing cubic form or as crystal aggregates. Pure galena contains 86.6% of lead and 13.4% of sulphur. When smelted it yields about 80% of lead, since a portion is volatilized and lost. The northern Arkansas product contains practically no silver, which is sometimes a constituent of galena.

The completion of railroads projected will afford facilities for shipping this ore, so that mines which could not be operated will probably begin work. Although few of the mines are situated near the railroads, the distances which the product must be hauled will be so lessened that the ores can be marketed profitably. With the development of the mines railroad spurs and branch lines will probably be built, and the field can assume its true commercial importance.

### Magnetic Alloys of Manganese.

Recently Dr. F. Heusler of Dillenburg, Germany, while experimenting with an alloy of manganese and tin, noticed that it was attracted by a magnetized tube, says the London Electrical Review. Upon melting the alloy with an equal weight of copper, he found the resulting combination also distinctly magnetic. He later succeeded in making magnetic alloys by adding tin to commercial copper manganese containing only 1.2% iron, the alloy being non-magnetic before the addition of tin. Experiments with other metals showed that arsenic, antimony and bismuth each had effects similar to tin, but aluminum gave the best results of all. Dr. Heusler, conjointly with Herren Richarz, Starck and Haupt, has made a thorough investigation of the whole subject. It was found that the most magnetic alloys are those in which the manganese and aluminum are present in direct proportion to their atomic weights. The temperatures at which these alloys lose their magnetic properties are comparatively low. One containing 16% of magnesium and 8% of aluminum becomes non-

magnetic at 160° C., and remains so if plunged in cold water. It becomes magnetic again if kept at a temperature of 110° C. for a day or two. By adding small quantities of lead, the transformation points may be brought down to still lower temperatures. It is interesting to recall in this connection the work of Barrett upon magnetic iron-aluminum alloys. It was suggested that these alloys may find applications in various directions, such as for fire alarms or some form of thermoelectric generator. The new alloys are strong, easy to work and not easily oxidized. In the latter respect they have an advantage over iron.

## Mining and Ore Treatment in Western Australia.\*

NUMBER II.

Written by DONALD CLARK.

**GOLD DEPOSITION—THE GREAT BOULDER.**—It is the common custom to make comparisons with other States in order to show the latest gold producer off to the greatest advantage, but such comparisons are not fair. Take, for instance, the Victorian case. Victoria in the early days was rushed by a gold-seeking population who had very little experience in searching for alluvial, and none when it came to extracting small particles of gold from hard rock. Reef after reef was left in the early days because the material was looked upon as too difficult to work; the evolution of quartz mining was slow, the work proceeded cautiously, and even now, owing to this original policy, any change of machinery or method is viewed with the greatest suspicion. Contrast this with the West. Thousands of trained miners flocked to the newly discovered fields; money poured in for development purposes; machinery of the most extravagant type was rapidly run up, and mines were opened up at a rate almost unparalleled. Had Victoria been a new field with modern facilities, modern knowledge and with modern men, then the world would have been astounded with the wealth produced year by year. Western Australia will be a great gold producer for years to come, but it may take another jubilee for her to catch up to the long lead Victoria has given with regard to gold production.

One cannot help contrasting the comparative small amount of alluvial—or so-called alluvial gold—won in W. A. in comparison with that obtained from reefs, with that of Victoria. Nor can one get over the remarkable fact that while the great bulk of the

material surrounding these outcrops should, in a field such as Kalgoorlie, have amounted to millions of ounces, and not the few thousands which have been won. The matter is well worthy of investigation, and it may throw some light on the poverty of some outcrops and their richness down below and vice versa.

One of the most noticeable features at Kalgoorlie

day and night, Sunday and Monday; it must be confessed that with work proceeding at such a rate, the greatest efforts have to be made to keep development work well ahead, and it is probable that the limit of production has been reached in most of the mines, and perhaps over-reached in a few of them.

It has often been stated that Victorian mining men were at a loss when called upon to deal with the

Public Condensers, Kalgoorlie, Western Australia.

is the enormous plants dumped down on such small areas; coincident with this is the hurry and bustle that goes on. "We are anxious to work the place out and get away from it," jocularly remarked one prominent mining man. "The gold is better in the bank than in the ground," was another excuse given for running out 30,000 ounces per month, and causing many sanguine shareholders to fall in. Victoria

lodes of Kalgoorlie. The matrix which contained the gold was not quartz, neither were the lodes, so-called, contained in a channel with defined walls. A hard blue rock, specked with pyrites here and there, which on Bendigo would be called mullock, carried the gold, and this material was called a lode wherever it was payable. Many of the mines contain little or no free gold; in others veinlets of telluride of

Method of Handling Tailings at Coolgardie, Western Australia.

gold obtained from the reefs is as fine as flour that very little of this gold has been won from the alluvial. It seems to be feasible that surface solutions may have had solvent action on this gold and carried it to spots where it has been reprecipitated. A certain amount of denudation has gone on all over the fields, and even if this only amounted to a couple of hundred feet during the time the present reefs were exposed, then the amount of gold shed into the brecciated ma-

in the early days sent shafts down a few hundred feet and appointed a Royal Commission to decide whether gold would probably go down to 1000 feet. At Kalgoorlie they sink to 1000 feet almost in one act and start off straight away for the second thousand. There can be no husbanding of resources with leases containing only twenty-four acres, where the small "hoppy-go-hop" batteries have been displaced by the hundred head of heavy stamps, with their long and rolling hum. Work progresses at a rapid rate,

gold, or blotches of the same mineral, barely distinguishable from pyrite, permeate the rock.

The rock which contains the gold is locally known as a diorite or greenstone, but it has been proved by examination to be a diabase. The lodes themselves are portions which have been fractured and fissured, and through such channels the auriferous solutions have flowed, leaving some of their valuable metals crystallized through the disturbed areas. On some parts of the field vast chambers have been hewn out

\*Abstract Australian Mining Standard

in removing payable ore; in others, such as the Boulder, the values are sharply defined to within a few inches one way or another of the width of material taken out. Appearance counts for little or nothing where no gold nor telluride veins are visible. It is only by a continuous system of sampling that the mining manager is guided as to values; not the slipshod assaying and sampling done on some of our Victorian mines, which have brought the practice into discredit.

Hundreds of assays, taken at regular intervals, broken down from wall to wall, are separately pulverized and sieved, and the sieved sample handed to the assayer. "How often do you take your samples?" "Every 6 inches in this mine," was the reply obtained from a manager who was not even then satisfied that he could speak with absolute certainty as to values. Certainly he erred on the right side, and his mine was as well mapped out as to values as the stock in a merchant's shop. This system, so necessary here, has been of such assistance to managers that it has been adopted almost universally; and it has been stated by most reliable men that even with patchy reefs, having coarse gold, their battery values followed their assay values very closely.

At times there are great discrepancies on this field between estimated and actual values, but if the origin of these were sought it would be found either in the incompetence of the men connected with the work or else be the result of market manipulations. It may be a difficult matter to value a mine to within a few per cent, but there is no excuse for values of a mine well opened up being declared to be hundreds of per cent over actual values.

Another indispensable method of development lies in the use of the diamond drill. This work is so important, and can be carried on so cheaply, that the best managed companies have made full use of the system, and have bored their properties from boundary to boundary, thereby gaining valuable information, and in many cases making important discoveries.

The Great Boulder property consists of four leases, the first two having an area of twenty-four acres each, the third twenty-one, and the fourth sixteen acres. The main workings are carried on in the first two leases, whose length in a northwesterly direction is nearly 3000 feet, and whose width is one-fourth of this, or 750 feet. The lode runs tantalizingly close to the western boundary, and dips towards the Ivanhoe property on the northern end. These last two properties, each having a lease of twenty-four acres, together with the Boulder, produce nearly half a million ounces of gold per annum. In the Boulder property a belt of rock classed as felsitic schists and slates, varying in width from 200 to 500 feet, runs along the whole length of the leases. On the western side is the Boulder, Horseshoe and Ivanhoe; on the eastern the Lake View, Perseverance, and other properties. The lodes on the Boulder mine are known as the east lode, the west lode, and a lode which forms a loop with the west lode, known as the west branch lode. The last outcropped close up to the western boundary, and dipped into the Golden Horseshoe property, thereby helping to make that mine one of the richest in the world.

The west lode, after a westerly dip, which brought it up to within 50 feet of the Horseshoe boundary, commenced to dip the other way, so that at the 1400-foot level it is farther away from the boundary than it has been for some time. Down to the 900-foot level the general trend of the dip is westerly.

In going down a mine such as the Boulder a casual observer cannot form any opinion as to values, other than that apparent from the quantity of stone removed, the absence of a mullock tip and the presence of barren material from other sources filling the stopes depleted of their ore. The ore removed must have been of wonderful value, for up to the end of 1900, 198,248 tons were treated for 449,944.7 ounces and \$175,000 paid in dividends. For the year 1900, 54,887 tons were treated for a yield of 115,908 ounces, and at the end of 1900 it was estimated that down to the 1000-foot level there were 143,800 tons, containing 211,324 ounces of gold, an estimate which has since proved to be considerably under the mark.

At the 1200-foot level the lode is 8 feet in width, and had been driven on at the date of my visit for over 500 feet, the values averaging at least two ounces per ton for this distance—none of that stone had been broken out. Although this level does not make the mine any more than one swallow makes summer, yet it has raised the hopes of the local people, who anticipated better yields from the lower than from the upper levels in other mines as well. This may prove so, but, taken as a whole, it would prove contrary to all other Australian experience.

The Great Boulder mine is one of the best developed on the field. The work done for a single year is suggestive:

## Notes on Mine Sampling.

Written for the MINING AND SCIENTIFIC PRESS.

No commission that falls to the lot of the mining engineer brings greater responsibility than that of a call to examine and determine the value of a mine. He may be requested to furnish plans for a mill, smelter or concentrator, or to devise an economical method of mining a low-grade body of ore, or to suggest other practical ideas and plans, all of which he may do with confidence, but when requested to give a professional opinion on the value of a mine he is placed in a position of trust upon which much more may depend than is at first sight apparent. He cannot afford to report adversely and have the mine prove a bonanza for the next fellow who comes along, and most assuredly he cannot afford to give a favorable report when the property does not justify such an endorsement. Necessarily he must make a careful, painstaking and thorough investigation of the surrounding country, giving attention to the transportation problem, the fuel and power problem generally, making comparisons between steam, water and electric or other power, if each is available, or, if not existent, state under what conditions and at what cost power may be obtained. If it is a smelting proposition the question of fuel, fluxes and water is important. Shall the smelter be located at the mines or at a distance? This he must determine. The title to the property is all important. He must be sure that if a valuable mine is developed his clients, should they purchase the property, or their assigns, may work it uninterrupted by adverse claimants. Where improvements are possible in the future, as to transportation, power or other conditions, these should be stated.

As to the mine itself, he must inspect the workings and decide about what quantity of ore will probably be available, and determine whether the shaft or tunnel is sufficiently large to handle the desired tonnage of ore, besides waste, handling men, timbers, supplies and water. It may be advisable to sink a new and larger shaft, or to drive a tunnel, and the site of either of these must be selected with reference to the distribution of known ore underground, and also with a view to surface transportation to mill or other works. In sampling, he will carefully sectionize the entire workings, measuring and sampling from wall to wall, if a vein of moderate size, or dividing it into blocks if a large vein, zone or ore body. The samples taken must represent, as nearly as possible, the ore as it occurs in the vein. Rich streaks may be measured and sampled separately if desired, and in many places it is better to do this, for a streak of rich ore an inch or two in thickness will create a false idea of the value of a vein 5 or 6 feet wide, if mixed with the low-grade rock, and particularly of the expense of mining, for the low-grade portion of the vein may be too poor to pay the cost of mining, which, together with other costs, must be borne by the small rich streak. There are various ways of arriving at the value of mines, and the taking of the samples is usually the easiest part of the operation. Any one who knows anything of practical mining, with a little instruction—if a novice at the business—can take mine samples, but it is very essential to know that the samples represent what nature, and not man, has placed in the ore. The experienced mine examiner quickly learns that he cannot afford to take any risks of being salted, and it is remarkable the various safeguards he must throw about himself in order to prevent this. When there is any considerable sum of money at stake on a mining deal, the engineer who samples the mine has many extraordinary precautions to take. These may be set down in his diary or field notebook in something like the following, and may be entitled, "Rules for Mine Sampling:"

1. Provide a box of nitro-powder directly from the manufacturer.
2. Take as assistants only sober men, whom you know to be above suspicion and who cannot be bribed.
3. Arrived at the mine or town in or near which the mine is situated, keep your business to yourself.
4. Have a sufficient number of new canvas sacks to accommodate all the samples you will take.
5. Have a good-sized, heavy canvas sack to hold small samples in sacks.
6. Have a heavy leather mail sack, into which the large canvas sack may be slipped when full.
7. Provide yourself with abundant tough check tags for marking number of sample.
8. Take no samples from ore found broken in the mine.
9. Pick—and, if necessary, "shoot"—away every face where it is proposed to take a sample, exposing a fresh surface which it is safe to assume has never been "fixed."
10. Politely, but firmly, request all persons to leave the mine except your assistants. This may hurt fine sensibilities of some persons, but it is safer.
11. Break all samples down at some convenient place underground. Quarter down and sack samples on the spot.
12. Do not work up your samples in a timbered stope or under a raise. Select a place in a drift where the solid rock is not over 7 or 8 feet from the floor of the level. This prevents industrious and opti-

mistic persons from helping out on the general average.

13. Occasionally put a piece of solid ore or a handful of fine stuff from the quartering cloth in your pocket to guard against future possible great discrepancies.

14. Never allow the samples to leave the level until you go, and do not go out and leave them behind, to be brought up by some of the obliging men about the place.

15. When you have reached the surface with them don't allow them out of your sight for a moment. It looks a good deal like a "tenderfoot," but tenderfeet are "easy."

16. Still keep your sample sacks in sight until you reach the assay office, and, if possible, let no one know to whom you intend to trust the assays.

17. Better still, make the assays yourself, if possible.

18. Test your fluxes and crucibles.

19. Whoever may make the assays, keep duplicate samples, for check.

20. In many cases it is a good plan to wash off several pieces of rock and assay the clean hard rock. This may not give correct values, but it affords a check against salting.

21. It is a good idea to have an associate who takes a line of samples wholly independent of yours, but at the same places. This will afford one of the most reliable checks upon the work, as it is improbable that anyone attempting to salt the samples of either or both could hope to have them tally.

There are other things in the art of mine sampling besides wielding a pick and cutting channels with hammer and maul, the measurement of vein widths and the mathematical selection of sample stations.

W. H. S.

## Lead and Zinc Deposits of Illinois.

Lead and zinc are found and have been mined in Illinois in two widely separated districts. One of these is in the extreme southern portion of the State and includes portions of Hardin, Pope and Saline counties. The other is in the extreme northeast corner of the State and includes a portion of Jo Daviess county. The deposits of these two areas are briefly described by H. F. Bain in a recent bulletin (No. 225) published by the United States Geological Survey under the title of "Contributions to Economic Geology, 1903."

The southern Illinois district has not yielded zinc in commercial quantity. The lead found there, which has been mined more or less steadily since 1842, is produced at present in connection with the mining of fluorspar. The maximum production of lead was in 1866-67, when there was a yield of 176,387 pounds, from the Fairview mine. Within the present year prospecting near Jonesboro, in Union county, west of the fluorspar district, has developed the presence of galena, whether in paying quantities or not it is too early to say.

The northwestern Illinois area forms a portion of the upper Mississippi Valley district, which, up to the middle of the nineteenth century, was the principal source of American lead. With the opening of the silver-lead mines of the Western States attention was diverted from the district. About the same time the mines reached a depth at which pumping became a serious burden, and the lead ores gave place to zinc ore. The producers of zinc blende in this district are at a disadvantage in competition with those of the Joplin (Missouri) district, for the Wisconsin-Illinois ores carry a higher percentage of iron. Until recently no convenient method of separating the iron from the zinc has been known, and the northern ores have accordingly lacked a market.

The principal product now obtained from this district is zinc sulphide. The Mineral Point Zinc Co., the chief buyer of the ores of the district, has equipped its plant for the manufacture of sulphuric acid, and is now able to economically handle the sulphide ores. The development of the process of roasting and magnetic separation has made it possible to build plants in small units adapted to the wants of individual mines. When cleaned by this process the ore has a wide market. Experiments with static electricity, operating on unroasted ores, have also been made with encouraging results, and it seems probable that the district as a whole will gradually become a large producer of zinc ores.

There is at present no important producing mine in northern Illinois. A considerable amount of development is under way and an increased output may be expected. There are thirteen properties upon which work is now going forward with a view to zinc production. On a few of these ore is being hoisted, but none are yet down to the horizons at which large bodies probably lie. The mines now operated are clustered mainly around Galena and Elizabeth. An area covering probably 150 square miles, occupying the northwestern portion of Jo Daviess county, may be considered within the proved ore-bearing district. With a less degree of probability, the whole of the county may be included. Mr. Bain believes that the upper Mississippi district may produce large quantities of zinc ores, and that the portion of the district lying in Illinois gives promise of developing with the rest.

## Gold Milling.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by  
ALGERNON DEL MAR.

As the object of stamp milling is the extraction of the precious metals from its ores, so the object of amalgamation is to obtain these metals as quickly as possible and to hold them at the pleasure of the operator. Mercury is used because its affinity for the precious metals is so great and the ease with which it is volatilized and condensed, leaving the three metals in a marketable state.

Gold exists in some ores in such a free state that the mere contact with mercury is sufficient to form an amalgam and thereby hold the gold, while the gold in other ores needs prolonged and repeated contact with mercury to accomplish the same purpose. Mills that treat the former class of ores need only be pulverizers, the gold being amalgamated on plates outside of the battery, while mills which treat the latter class must not only crush the ore, but amalgamate it as soon as possible, so as to allow no chance of the gold escaping, and to accomplish this end amalgamated copper plates are used both inside and outside the mortar.

Amalgamation in a stamp mill is governed by the amount of mercury used, the amount and temperature of the water, the fineness of crushing, the height of discharge, the physical and chemical nature of the ore, and the character of the amalgamating surfaces.

The amount of mercury used varies as the amount of metals amalgamated, and is regulated as explained later on. The loss of mercury due to chemical and physical causes varies from  $2\frac{1}{2}$  to  $14\frac{1}{2}$  dwts. per ton of ore crushed, and will average about 6 dwts. This may be reduced somewhat by the employment of concentrating devices and mercury traps.

Enough water should be used to carry the pulp off the plates, but no more, and it should be as clean as possible. The battery water tank should be kept under a constant head, and to insure greater uniformity of temperature should be protected from the weather. These two requirements will save the millman the trouble of constantly regulating his water supply, and will keep the amalgam at a more even consistency. From  $50^{\circ}$  to  $60^{\circ}$  F. is a good temperature. Slimy water should never be used, for it will carry off fine gold that would otherwise have settled on the plates.

The degree of fineness to which an ore is crushed affects amalgamation principally in a physical way. As far as we know (except in rare instances) gold exists in its ores as a mechanical mixture, and to be freed must be ground to that degree of fineness that will allow the gold to separate from the worthless material, usually quartz. If this degree of fineness is not attained small pieces of quartz or iron, with adhering pieces of gold, may often be seen on the plates, and as the amalgamating surface is only a portion of the whole, these pieces of gold quartz gradually get washed down the plate until they are lost in the tailings. The remedy is a finer screen.

The character of the amalgamating surfaces has undergone some modification in late years and now usually consists of two inside plates, a lip plate, sometimes a splash plate, and the tables proper. The inside "back plate" extends the full length of the mortar, is about 6 inches wide, is bolted to the mortar and is protected from the falling ore by a projecting lip or a false lining in the mortar opening. The "front plate," or chuck-block plate, is screwed to a curved block of wood extending the whole length of screen opening, which in turn is bolted to a block which extends across the screen opening, and is wedged against the mortar along with the screen frame, the screen frame resting on the chuck block. These two plates are made of soft copper and are simply rubbed bright with quicksilver. Under favorable conditions they catch about half the gold set free by the stamps.

Immediately outside the mortar, on the cast-iron lip, is usually a lip plate, made of copper, the full width of the lip, which may be supplemented by or used in conjunction with the splash plate, which is placed in front of the screen, inclining toward it, and which can be removed at will. These two plates nearest the battery can be used as indicators for the inside plates and need not be touched except to scrape on cleanup days, or when they become overloaded. The outside plates are the full width of the mortar, are of copper,  $\frac{1}{2}$ -inch thick, electroplated with from one to two ounces of silver per square foot, about 12 feet long, and given a fall of  $1\frac{1}{2}$  inch per foot. It is well to have them in three sections, with a drop of  $\frac{1}{2}$ -inch between each. A greater drop will cause scouring. This will give a chance for the pulp to turn over and may prevent the escape of float gold. The upper section is sometimes made movable, sliding over the next lower plate, so that it can be removed from in front of the mortar while making repairs or cleanups. At the end of the lower plate should be a mercury trap to catch any amalgam or quicksilver washed off the plates. The tailings then go to the concentrators, and maybe to the cyanide plants,

(See Page 61.)

which subjects come under the head of "Concentration and Cyaniding."

Mercury is fed into the mortar, the amount depending upon the state of the amalgam on the outside plates, and consequently upon the richness of the ore. Two objects must be attained, first, the inside plates must be kept hard enough to hold its amalgam; and second, the outside plates as sensitive as possible for amalgamating the gold passing over them. The appearance of small masses of amalgam on the plates indicates the inside plates are being scoured or are too soft. If globules of mercury or "tears" appear on the plates then the outside plates are too soft. If the amalgam feels hard then more mercury must be added. The inside plates must be hard enough to retain all the amalgam, and the outside plates soft, putty like and bright.

Rubbing and complete amalgamating of a plate is of more benefit than chemicals. No acids should be used at all and cyanide of potassium or other chemicals only when necessary. The careless scratching of plates is often the beginning of a spot that will sooner or later get fouled by verdigris, due to the exposure of the copper to oxidation. On copper plates, well electroplated and well taken care of, verdigris will seldom appear; but cheap electroplating will soon wear off in spots. The usual remedy is to treat the spots with caustic soda or cyanide of potassium; but a better method is to cover with silver or gold amalgam, and when cleaning up not to remove this coating entirely. This will lock up a small quantity of amalgam, but will keep the plates in better condition. I have found that to change the positions of the plates is a benefit. It will be observed that this fouling does not occur so much near the mortar, because more amalgam covers the plates there; so if the plates below are shifted up, they will soon get well coated, while the former upper plate will be in good condition. The plates, in any event, should not be rubbed dry, but a sufficient amount always left to form a good amalgamating surface—a precaution which many mill men are obliged to omit, by reason of the demands of the management.

Black spots on plates may be due to grease or to

chemical reactions between the constituents of the ore and the plate, also in conjunction with the iron or steel from the shoes and dies. A good remedy is to rub with a mixture of nitrate of silver, cyanide of potassium and a caustic. If it is grease, the cyanide of potassium or caustic soda will remove it and the nitrate of silver will leave a covering of silver amalgam. Simply rubbing the plates well with a whisk broom will often remove the spots without the use of chemicals. If the spots are due to antimony, use a salt solution. Sodium sulphide also removes antimony.

At every shift the plates should be rubbed up with a whisk broom and as often as necessary to keep them bright. It is better to amalgamate the crushed ore and lose a little time than to run it to waste. The procedure of cleaning up varies in detail in different mills and has been so often told that only a mere outline is deemed necessary. The amalgam taken off the various plates should be weighed separately. If the daily clean-ups from the outside plates are proportioned with the total clean-up at the end of the month, it furnishes a ready means for the superintendent to approximately estimate how much the mill is recovering each day, so he may know from day to day whether to supply richer ore or to curtail his force to meet expenses at the end of the month. I have an instance in mind where every ounce off the plates per twenty-four hours' run means \$12.50 for the total clean-up; so that one could tell each day just what the mill was doing.

(TO BE CONTINUED.)

U. S. CONSUL-GENERAL RICHARD GUENTHER at Frankfort, Germany, reports that aluminum is now being substituted for wood in the machinery of spinning mills. Aluminum bobbins are replacing the old wooden bobbins. For this purpose the metal is better, as it is not only lighter, but is not affected by variations in temperature nor humidity. As the bobbins are lighter than the wooden ones—five aluminum bobbins weighing no more than two wooden ones—the machines carrying them are able to operate at an increased speed.

## THE PROSPECTOR.

The prospector should remember that there are laws regulating the taking up of mine locations, and these laws for the most part are simple and easily understood. One of the first things with which the prospector should equip himself is a knowledge of the laws governing the location of claims—not only the Federal Statutes, but also the State and local laws of the district in which he is prospecting. While the laws permit him to take up as many claims as he sees fit to locate, the plan followed by some of appropriating a score or more of locations is not a good one, for in most cases the prospector has all he can attend to do the assessment on two or three claims, particularly if the claims are low grade and require a large amount of development to make them valuable. Rarely does the prospector who appropriates all the ground he can locate in a new district sell these claims or any of them to advantage. Generally out of the entire lot there are not more than two or three good ones, and often none of them prove to be valuable. His best plan will be to develop one of the lot—the most promising—and usually this may be determined by the surface appearance of the ground. Most good mines carry an index of the fact in the outcrop. Another point worth remembering is not to scatter the development work too much. Select a promising place at the start and confine work to that place. This need not be at the point of discovery, but anywhere on the claim where the mineral indications are most encouraging. A most important matter is to stake the claim properly and completely, and, if possible, have witnesses to the corners, for, in the event of the property becoming valuable, it is very necessary that the claim be completely staked and that every requirement of the law be observed. This should be done just as soon as it can be decided in which direction the lode strikes, then lay the claim out along the line of outcrop, locating in such a manner that the apex shall lie as nearly as possible along the center of the claim. These things are important in order to secure perfect title to the property and to enjoy the privilege of the extralateral right.

The rock samples from Crown King, Arizona, are: Nos. 1 and 2 greenstone, probably diabase. The dark bisilicate is wholly altered to chlorite, which renders their identification difficult. No. 2 contains considerable finely disseminated pyrite. No. 3 is a siliceous rock, presumably eruptive, though possibly metamorphic sedimentary. The peculiar yellowish green mineral which colors it is epidote, which is derived from the decomposition of chlorite. None of these rocks are ores or have any value. Rarely epidote rocks contain gold when in the vicinity of rich veins, or occur in mineralized zones containing gold.

The small rock sample from Barstow, Cal., is perlite, a variety of volcanic glass. Considerable of this material is found in dikes in the Calico hills northeast of Barstow, particularly near the head of Wall Street canyon, where it occurs in the form of dikes cutting the rhyolite breccia. It is of no value. Numerous crystals of black mica (biotite) are seen in the specimen.

The mineral specimens from Fresno, Cal., numbered 1, 2 and 3, are mica schist, a country rock and not properly vein rock or "matter." These rocks contain a large amount of silica (quartz), and No. 2 exhibits a few scattered crystals of pyrite and may be gold bearing. In Madera and Fresno counties the micaceous schists and slates, from the vicinity of Grub Gulch southward, form the country rock through a large portion of the gold district in that section, and the schists are often found gold bearing in the vicinity of the veins.

## The Sulphur Industry.

The report of the twelfth census of the sulphur and pyrite industry has been completed by the census bureau. The statistics for both sulphur and pyrite have been united in this report in order not to disclose the individual operations of one company engaged in producing sulphur. The following table presents a summary of the combined statistics for these minerals in 1889 and 1902. The expansion of domestic production to meet the increased demand for sulphur and sulphuric acid is clearly indicated:

	1902.	1889.
Number of mines.....	23	2
Number of operators.....	18	*
Salaried officials, clerks, etc.....	54	*
Salaries.....	\$49,890	\$5,512
Wage earners.....	970	249
Wages.....	\$398,870	\$64,789
Contract work.....	\$3,587	\$23,103
Miscellaneous expenses.....	\$39,118	\$30,262
Cost of supplies and materials.....	\$217,262	\$43,700
Product:		
Quantity, long tons.....	207,874	105,100
Value.....	\$947,089	\$209,969
* Not reported.		

The table shows an increase in production of over 100% since 1880, and in value of nearly 190%. When the total amount of sulphur consumed (as sulphur, not including pyrite) is taken into consideration, the amount of the domestic production in 1902 was not relatively large, but the steady increase indicates the

substantial nature of the industry. In 1880 the industry was small, only one pyrite mine, with a product valued at \$5000 being reported, but in 1889 the value of the production of sulphur and pyrite was \$209,969. This increased to \$947,089 in 1902. The growth from 1880 to 1889 was greater proportionally, but that from 1889 to 1902 was larger in absolute amount.

## The Rio Vista Copper Mines.

The old Cosumnes copper mine, now owned by the Rio Vista Copper Co. of San Francisco, Cal., is in El Dorado county, Cal., near the village of Fairplay and not far from the Cosumnes river. The company owns forty acres of patented mineral land. The ore is associated with a tongue of limestone, which is included in the granite which forms the greater part of the country rock of the vicinity. The vein is about 30 feet in width at one place, the ore being chalcocite, bornite, and as the secondary products of the alteration of the sulphides, malachite, azurite, etc. The best ore will average, it is said, 15% to 20% copper and about \$10 in gold and silver per ton. The mine is opened by three tunnels, each about 150 feet in length, also a shaft 150 feet deep. The equipment consists of an air compressor and machine drills. The motive power is supplied by water. The Cosumnes river has been dammed and the water flumed for  $\frac{1}{2}$  mile to the mine. The accompanying engraving of the flume illustrates some of the disad-

Flume of Rio Vista Copper Co., El Dorado County, Cal., Showing Contact of Limestone and Granite.

vantages of construction of water power installations in mountain regions. The picture was taken near the contact of the granite and limestone, the differing character of the rocks being plainly evident. The limestone occurs for most part as a series of abrupt cliffs in terraces, the granite disintegrating more readily, forming comparatively smooth slopes, covered with brush and pines. It is the intention of the company to sink a shaft at the end of the lower tunnel and to install a hoist to be driven by compressed air. A. C. Morrison of Fairplay is superintendent.

## Unscientific Geology.

There may be said to be three kinds of geology—scientific, unscientific and judicial. Concerning the last mentioned, G. F. Becker of the United States Geological Survey, in discussing the court decisions in certain mining litigation, remarked, "the difference between scientific and judicial geology has long since been recognized." It may be said that the difference between scientific and unscientific geology is also easily recognized. The following issued by a firm of New York mine promoters is a sample of the unscientific kind. The paragraph is but one of a number that are equally absurd and misleading:

**FISSURE.**—A crevice in the earth's crust, formed originally by the upheaval of a molten mass containing the minerals, which was thrown from the center to the surface. This molten mass, working up and down in the fissure, generally worked the granite walls smooth, and by contraction in cooling a small space was left between the mineralized portion and the wall on each side; this space filled in with sand and other foreign substance, which is called "slickensides," and whenever this is found it is an indication that the vein is a "true fissure" and will widen with depth and also grow richer, on the principle of gravity—the metals being of greater gravity than the balance of the vein matter. Many veins are only a crevice from the surface reaching downward but a short distance, the space having been filled largely by infiltration, consequently liable to end at any point—or, to use a mining term, to "pinch out." A contact fissure is one formed between two different walls; for instance, one wall might be diorite and the other granite.

A definition of a fissure vein, and an explanation of the genesis of ore deposits, more absurd than the above, would be difficult to conceive.

## The Ore Deposits of Bisbee, Arizona.\*

NUMBER II.

Written by F. L. RANSOME.

**COPPER.**—In the native state this metal was not an uncommon constituent of the lower portions of the great oxidized ore bodies worked a few years ago in the Copper Queen mine. According to James Douglas, it was abundant just above the third level at the bottom of the great ore body southwest of the Czar shaft, occurring in masses, some of which weighed several hundred pounds. Native copper is now, however, rather rare in this mine. In the course of the present investigation the metal was observed as small particles in stope 33, just above the third level and about 750 feet northeast of the Holbrook shaft. The ore body at this point is a rich mass of chalcocite and pyrite enveloped in a soft white clay that is evidently derived from altered limestone, and is in part taken down as ore. The native copper occurs as small hackley particles in this clay, associated with occasional specks of cuprite and little streaks of chalcocite. Native copper occurs also in partly oxidized ore, containing residual bunches of chalcocite, in a rich stope between the fifth and sixth levels, about 400 feet east of the Spray shaft. In the Lowell mine it was observed on the 1000-foot level in oxidized ore

near pyrite, and on the 1100-foot level, just north of the shaft, embedded in a ferruginous clay near a body of chalcocite ore which immediately overlies a mass of pyrite.

At the present time native copper is found most abundantly in the Calumet & Arizona mine, particularly on the 950-foot and 1050-foot levels. It is usually closely associated with cuprite, and occurs as a rule in proximity to sulphide ores. On the 950-foot level, about 400 feet southeast of the shaft, the bulk of the ore of a large, rich stope consists of crystalline cuprite bound together into a tough mass by an irregular web of native copper. With the cuprite and copper are associated some limonite and other earthy oxides and a little fibrous malachite, chiefly in vugs.

On the 1050-foot level native copper is abundant as tough, spongy aggregates of small crystals, sometimes encrusting chalcocite and sometimes enveloped in ferruginous clay or earthy oxide ores. It also occurs as thin layers along fissures in clayey, oxidized ground as small, loose crystals, up to 2 or 3 millimeters in diameter, showing the usual modified cubes and octahedra embedded in a soft, earthy mixture of cuprite, limonite and kaolin.

**GOLD.**—This metal occurs free in the Easter Sunday mine, rather irregularly distributed through some beds of light-colored quartzitic sandstone. The bulk of the ore occurs in a bed about 4 feet thick dipping about 55° to the north-northeast, but the mineralization is not entirely confined to this bed. The sandstone has been irregularly fractured, probably during the post-Cretaceous folding, and the resulting small fissures have been filled with veinlets of quartz and calcite. No gold was seen at the time of visit, but it is said to be occasionally visible, usually in little calcite vugs stained with oxide of iron. It appears to have been introduced into the beds subsequent to the fracturing.

Small quantities of placer gold have been obtained from the upper part of Gold gulch. This gold has been derived from the Glance conglomerate, and concentrated in the sand and gravel of the present arroyo. It is not present in sufficient quantity to be of economic importance.

**PYRITE.**—Although not, strictly speaking, an ore,

\* Abstract Professional Paper No. 21, U. S. G. S.

pyrite is here included with the ore minerals on account of its intimate chemical, physical and genetic relationship with them. It is the most abundant and ubiquitous sulphide in the district, and the one of which all the ore bodies, however varied may be their present constitution, originally in greater part consisted.

In the form of small crystalline grains, disseminated through masses of altered rock, pyrite is abundant in the intrusive porphyry mass of Sacramento hill and in the adjacent schists which partly inclose that mass on the east. Associated with the great bodies of copper ore disposed about the porphyry mass in the limestones south of Bisbee pyrite occurs in large quantity. In the upper levels of the mines, where oxidation has been active, it is sometimes found in isolated masses inclosed in envelopes of chalcocite and oxidized ore. In the lower levels it forms extensive bodies, which pass somewhat gradually into altered limestone, in which the pyrite occurs disseminated in small grains, usually of rather irregular outline, and in little bunches and stringers. Of these pyritic bodies only those portions that contain chalcopyrite or chalcocite have proved workable.

With the object of gaining insight into the problem of the genesis of the ore bodies, the pyrite disseminated through the limestone has been studied with some care. Microscopical examination of thin sections shows that its occurrence is nearly always associated with the development of silicates in the limestone, particularly tremolite, diopside, garnet and vesuvianite. In some cases the calcite has been entirely replaced by silicates and pyrite, with usually more or less quartz. In other cases the silicates are lacking, and the limestone has been altered to a mass of quartz and pyrite. The pyrite is contemporaneous with and intergrown with these minerals, and to this fact is perhaps largely due the general absence, in all but the smallest individuals, of that sharpness of crystallographic outline common in pyrite that has been introduced into rocks by processes subsequent to the development of their general texture and mineralogical composition; as, for instance, the cubical crystals of pyrite disseminated through the slaty rocks in the vicinity of many of the mother lode veins in California. The essential contemporaneity of the pyrite and the amphibole, pyroxene and other metamorphic minerals is a very important fact, and will be again referred to in discussing the genesis of the ores.

**CHALCOPYRITE.**—So far as observed in the Bisbee quadrangle, this mineral occurs only in massive form, never in distinct crystals. It is apparently confined to the limestones. Unlike the pyrite, it is rarely met with in a disseminated condition, but when present at all is likely to be accompanied by pyrite and to constitute fairly solid masses of ore. An excellent example of such an occurrence is found in the body of chalcopyrite ore on the seventh level of the Spray mine. Mr. Douglas, in his interesting account of the Copper Queen mine, refers to this mineral as disseminated with pyrite in fine grains through the rock. But of mineralized limestone collected in 1902, only two specimens—one from the third level, about 700 feet southeast of the Holbrook shaft, and one from the face of a new northeast crosscut on the sixth level, which at the time of visit was about 150 feet northeast of the Gardner shaft—show this mineral in disseminated form associated with pyrite, chlorite, and a little sphalerite. It undoubtedly occurs elsewhere in a similar state, but it is certainly not abundant throughout the mass of the pyritized limestone. As an ore-forming mineral, too, it is much less common in the present workings than chalcocite and the various oxidized ores. In addition to the occurrences just mentioned, chalcopyrite was noted on the sixth level between the Spray and Gardner shafts. Here a small body of sulphide ore has been taken out alongside the main drift. A little left adhering to the walls showed minute bunches and veinlets of chalcopyrite in a mass consisting chiefly of pyrite and chlorite. It is also reported in the old Dividend stope on the fourth level of the Holbrook mine.

A little chalcopyrite occurs with chalcocite and pyrite on the 1100-foot level of the Lowell mine and is reported to have been found in bunches within a mass of pyritic ore cut by the shaft at this level. In the Calumet & Arizona mine a little chalcopyrite with pyrite was noted on the 1050-foot level, and the mineral is said to have been met with in the shaft about 50 feet below this level.

**SPHALERITE.**—Sphalerite, or zincblende, is of rare occurrence in the Bisbee quadrangle. In the course of the present investigation it was noted at two places only. One of these is near the Cogswell stope on the third level of the Holbrook mine, where it occurs in little specks with pyrite and chalcopyrite in silicified limestone. The other is in the sixth level of the Gardner mine, where, in a new crosscut northeast of the shaft, small particles of sphalerite are associated with pyrite in altered limestone. Sphalerite also occurs in small quantities with pyrite and galena at the Modern mine, just north of the quadrangle.

**CHALCOCITE.**—This mineral, familiarly known as copper glance, or "glance," is the most important sulphide occurring in the Bisbee quadrangle, since nearly all of the bodies of workable sulphide ore owe their value to its presence. So far as observed, it

occurs only in massive form, distinct crystals being nowhere seen. It is sometimes firm and compact in texture, but is often rather soft and occasionally has almost a sooty character.

In the Copper Queen group of mines chalcocite is found at various depths, but never far from oxidized ore. Its most characteristic place of occurrence is in the irregular zones of rich sulphide ore that usually intervene between masses of lean pyrite and oxidized ores containing cuprite, native copper and carbonates.

In the Copper Queen mine chalcocite was observed on the second level in the Cogswell stope, about 700 feet southeast of the Holbrook shaft. The ore of this stope is a mixture of loosely cohering granular pyrite and chalcocite, the latter occurring in part as dark envelopes about the grains of pyrite. The ore body is surrounded by a soft, white clay which is speckled with pyrite and traversed by little veinlets of chalcocite.

On the third level chalcocite was seen in stope 38,

them, such as lubricators, oil and grease cups, cocks, etc., of all sizes. Neat designs of racks containing various sizes of whistles, injectors, pop valves and a variety of other specialties, lend to make up an exhibit worthy of notice. A new design of water gauge, and oil pump for cylinder lubrication, are features in themselves. Dispersed about the exhibit are pipe fittings of every description, together with whistles, safety and check valves and numerous other appliances.

The large variety of steam goods exhibited by the Lunkenheimer Co., and manufactured by them, necessitates more than a casual glance to thoroughly appreciate the exhibit in all its details.

### A Black Hills Mine and Mill.

The Hidden Fortune M. Co.'s property is 3 miles southwest of Deadwood, S. D., and lies on the west side of the northerly end of the Homestake proper-

Hidden Fortune Mill, Near Deadwood, South Dakota.

about 800 feet northeast of the Holbrook shaft. Here again the ore is a crumbling mixture of pyrite and chalcocite. The country rock, originally limestone, has been altered to a white, clay-like material streaked with chalcocite and speckled with native copper.

(TO BE CONTINUED.)

### The Lunkenheimer Exhibit at St. Louis.

In Machinery Hall building, location, 5 G, block 26, is the unique exhibit of the Lunkenheimer Co. of Cincinnati, Ohio. It is easily identified by a large model of their familiar "valve in hand," which occupies a

prominent corner of their exhibit, as shown in the accompanying illustration. Pyramids of globe, angle, cross, lever and gate valves, of various designs and sizes, both brass and iron, are artistically arranged about the exhibit, and are agreeably offset by a black plush curtain at the side and rear. The glass cases arranged in front of the exhibit contain a smaller class of the goods manufactured by

The Lunkenheimer Exhibit at St. Louis.

Cambrian quartzite occurs wolframite (iron-manganese tungstate), valuable in the manufacture of some varieties of steel. In the search for wolframite O. P. Grantz was disappointed several years ago, but discovered instead a rich pocket of gold, from which he took about \$60,000 in sixty days. This was on the Hidden Fortune claim, and since then considerable development has been done and a mill built 7 miles

prominent corner of their exhibit, as shown in the accompanying illustration. Pyramids of globe, angle, cross, lever and gate valves, of various designs and sizes, both brass and iron, are artistically arranged about the exhibit, and are agreeably offset by a black plush curtain at the side and rear. The glass cases arranged in front of the exhibit contain a smaller class of the goods manufactured by

down the canyon and about 3 miles below Deadwood (see accompanying engraving). The ore is treated by cyanide process, the solution being run through the batteries. The mill has a capacity of 250 tons per day. There are several cyanide mills in operation in the Black Hills, but all do not crush the ore in the solution.

## Mining and Metallurgical Patents.

PATENTS ISSUED JULY 12, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

CONCENTRATOR.—No. 764,197; C. H. Mubleman, Los Angeles, Cal.

In concentrator, concentrator pan mounted upon shaft; ruffles in bottom of pan arranged in radial rows; and means to give pan rotary gyratory motion comprising bearing for shaft intermediate its ends, in which bearing shaft is revoluble; revoluble wheel having socket into which lower end of shaft projects, socket being at one side of center of wheel.

ORE CONCENTRATOR.—No. 765,042; F. N. Rogers, Denver, Colo.

In ore concentrator, combination with independent classifying concentrating surfaces arranged for progressive concentration, of means for imparting impulses to respective concentrating surfaces independently of each other to impart classifying movement to pulp particles, means for taking off desired portions of discharge of more or less classified pulp at every point of discharge thereof in continuous sheet from one concentrating surface and adapted to deliver all of portions of pulp, without intermingling of existing classification thereof, to succeeding concentrating surface so that points of delivery onto succeeding concentrating surface are relatively farther from termination of concentration action on that surface than points of discharge from preceding concentrating surface are from termination of concentration action on that surface, thereby effecting progressive concentration over successive concentrating surfaces.

DEVICE FOR SEPARATING SLIMES IN ORE REDUCTION.—No. 764,973; O. P. Ankeny, Deadwood, S. D.

Filtering cell comprising peripheral frame; filtering web folded about one side bar of frame covering two opposite sides thereof and lapped over edges of opposite side bar for inclosing cell; plate outside opposite side bar; bolts which bind it to side bar with edges of canvas grasped between plate and bar for securing them to latter, frame having other bars interposed between opposite sides of filtering web having edges grooved and covered by web; U-shaped clamps striding grooved bars engaging grooves and sinking web thereinto, opposite ends of clamps extending through plate and provided with slots above latter and tapering keys adapted to be driven in slots to force clamps into grooves.

ORE CONCENTRATOR.—No. 764,979; S. Beer, Butte, Mont.

In ore mill, pan, driving shaft extending vertically through pan, hub surrounding shaft, cap on hub, screw operating in cap and engaging top of shaft for moving hub vertically, cylindrical part attached to hub and having side openings, cheek pieces extended outward from sides of openings, bearing boxes mounted to rock in cheek pieces, and rollers having shaft bearings in bearing boxes.

CHAMFERING MACHINE FOR MAKING MINE TIES.—No. 764,820; T. B. Price, Cresco, Pa.

In chamfering machine, pair of cutter heads arranged to cut parallel grooves, and additional pair of cutter heads arranged in oblique positions with first pair of cutter heads, second pair of cutter heads being arranged on sliding shafts, springs arranged on shafts to hold them to outer part of courses, and additional cutter heads arranged to be drawn inwardly in operation of machine.

MINER'S LAMP.—No. 764,700; G. Anton, Monongahela, Pa.

Lamp for burning tallow, wax or like, comprising outer shell of metal having relatively low coefficient of heat conductivity, and inner shell of metal having relatively high coefficient of heat conductivity, each of shells comprising body, bottom and wick tube or spout, bottom of outer shell having flange and raised portion, forming annular groove or recess receiving lower edges of body portions of shells, and bottom of inner shell having depressed portion seated on raised portion of bottom of outer shell, and flange projecting into groove or recess and crowding lower edges of body portions of shells outwardly toward and against flange of bottom of outer shell.

MAGNETIC ORE SEPARATOR.—No. 765,013; F. J. King, Croydon, England.

Magnetic separator comprising set of magnet bars for sorting material, and another set of curved mag-

net bars at right angles to first set and overlapping lower end of first set for purpose of separating sorted material.

TUNNEL OR LIKE CONSTRUCTION.—No. 764,797; E. Diebitsch, New York, N. Y.

In building of artificially supported submarine tunnel or like, process which consists in sinking caisson, building artificial support from within caisson, and building tunnel on support.

MEANS FOR TREATING PIECES OF MICA TO PREPARE THEM FOR ADHESIVE UNION WITH EACH OTHER OR WITH OTHER ARTICLES.—No. 764,811; C. W. Jefferson, Schenectady, N. Y.

Machine for treating scales or pieces of mica or similar material to prepare them for adhesive union with each other or with other articles, consisting of support for pieces, heating device and means for producing relative movement between support and heating device to enable support and pieces resting on same to be within sphere of heating device but without coming in contact with same, whereby adhesive on surface of pieces may be caused to adhere to surface.

CYLINDER FOR BALL MILLS.—No. 764,715; G. Descamps, Mons, Belgium.

Cylinder for ball mills provided with rows of lining stones having bulged heads and intermediate opposing rows of lining stones arranged in pairs and having straight beveled faces, to form V-shaped valleys.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS

## ALASKA.

The Brown-Alaska Co.'s copper smelter, at Coppermount, on Prince of Wales island, opposite Ketchikan, will blow in about August 1, says S. I. Silverman, part owner. The smelter and mine are being connected by a Bleichert tramway, with capacity of carrying fifty tons an hour. The smelter will have a capacity of 400 tons a day. The company is composed of B. D. Brown of New York, E. H. Morrison of Fairfield, Wash., and S. I. Silverman. The Cleveland, Ohio, people, who own a property on the island, have resumed work and have developed to a depth of 150 feet. They claim to have a ledge 50 feet wide, averaging 6% copper. At Copper mountain, on the opposite side of the island, work is being done by Mellon & Reynolds. A Pittsburgh, Pa., company is finishing a 250-ton smelter, which will be completed this fall, says Silverman.

H. A. Starkey, of Juneau, of the Bauman Gold Dredging Co., has men at the mouth of Gold creek, sampling the bar with a view to putting in a gold dredger. A dredge intended for Windham is enroute, and will be set up at Gold creek, says the Dispatch.

## ARIZONA.

### Cochise County.

D. Collard, superintendent of the Gold Nugget M. Co., which owns property near Bowie, in the Dragon mountains, says he is arranging for a mill to handle the ore from the Gold Nugget on the ground, and to do away with the expense of shipping to El Paso smelters. The Gold Nugget owns seventeen claims in Immigrant canyon and four in Apache pass. The company has 250 tons of ore on the dump, which carries gold. Over 800 feet of development work has been done. The mill will have five stamps, each weighing 1050 pounds, and will be placed below the mine, where there is plenty of water for all purposes. A concentrator will be used. It will cost \$3 to mine the ore and get it to the mill, and \$1.50 more to run it through the mill, says Superintendent Collard. Besides gold the ore carries lead and silver values.

### Maricopa County.

Platt et al., of Prescott, have bonded the Ryland copper property, near Wickensburg, for \$40,000, for eighteen months.

### Mohave County.

W. A. Mensch, at Stockton Hill, manager of the mines of the Enterprise M. Co., says it is intended to put in a steam hoisting plant and pumps. Twenty-five men will be worked.

Hoffman Bros. have completed the wagon road from the Roger Boy mine to the Samoan mine, near Chloride, and are putting in a hoisting plant.

### Final County.

(Special Correspondence).—Development work will be resumed on the Lucky Boy claim in the Saddle Mountain district this week. A strike of gold-bearing quartz was made on this claim. Douglas parties are interested in the claim.

D. W. Guardham is at work on a promising claim in the Saddle Mountain district.—J. Evans is developing a lead property up Gila river, about 10 miles above Dudleyville.

Dudleyville, July 18.

### Yavapai County.

G. D. Mortimer, superintendent of the Rincon mines,  $\frac{1}{2}$  miles from Martinez, says the mines are improving. There are 3 feet of ore in the Dixie ledge which is said to run \$16 per ton. A small pumping plant is being put in. Twenty men are at work. Power drills have been put in. The Welcome is ready to stop. The 1-stamp test mill is running.

Men are at work taking out the steam stamps and putting in five 850-pound gravity stamps in the mill for the Monica G. M. Co., near Kirkland. A 15-ton cyanide plant is also to be put in. The process of treating the ore will be straight amalgamation and cyanide. A gasoline pumping plant to pump water 2000 feet from a well for the works is being put in. Ore is blocked out. T. M. Earnhart is manager of the Monica Co.

## CALIFORNIA.

As soon as the Louisiana Purchase Exposition officials, at St. Louis, Mo., furnish the necessary water and power the stamp mill erected by California in the mining gulch will begin operations. The mill has three stamps. The fair officials have also agreed to supply the gold quartz. This will come from various States. It

will be operated afternoons. California will also show a hydraulic giant in operation. One of these has been set up in the State's outdoor mining space near the mill. It has a 3-inch nozzle. There is no gravel bank for it to tear down, but a stream will be thrown 200 feet from it against a bulkhead. One of the features of this exhibit will be a demonstration of how easily one man can handle the powerful giant, turning it in any direction with ease, controlling it with the use of the hand. A rotary mill and three concentrators are also to form part of the California outdoor mining exhibit. The entire exhibit covers half an acre.

### Alameda County.

The American Magnesite Co., of Oakland, is preparing to develop and work magnesite claims in Alameda and Santa Clara counties. The property of the American Magnesite Co. includes twenty-six claims. The claims in Cedar mountain district in Alameda county are: Stillwell magnesite lode, Virginia magnesite lode, Reed claims, Dassonville, Dead Horse and Virginia claims. Those in the Red Mountain district, Santa Clara county, are: Merchant, Old Man, White Cap et al. The Board of Supervisors of Alameda county is said to have appropriated a sum of money this year to build a road to the magnesite mines.

### Amador County.

The Fremont-Gover (Fremont Con.) mine, near Amador City, which has remained closed for the past three months, due to a strike of union miners, is being reopened with non-union men. The imported miners numbered forty-eight. They were brought into the county within a few miles of Ione on a special car and thence in teams to the mine. At the Fremont-Gover mine, a barb wire fence was put around the entire property after the strike began. Electric lights are used at night and watchmen are employed. No union men are allowed on the premises, while the imported miners are boarding at the mine.

### Butte County.

The Wyandotte M. & M. Co., incorporated this spring, has on the mine a 5-stamp mill, and as development progresses more stamps will be added. There is an abundance of water and timber and it has good transportation facilities, being only 8 miles from Oroville on the railroad, from which a road runs to the mine. In addition to water, electricity can be secured for power, as the Bay Counties Power Co. line is a mile from the mine. The pay streak is being opened up. The board of directors of the Wyandotte M. & M. Co. are: A. Anderson, H. W. Zilmer, J. T. Stanton, J. Loeffler and C. Miller. August 1 the stamps will start crushing quartz and more miners will be put on.

### Calaveras County.

Last week the vein of the Voinich mine at Bear mountain, west of Angels, was cut into by the shaft which is being sunk. The shaft is all in vein matter and the ore carries sulphurets and free gold, said to assay \$20 in free gold, exclusive of the sulphurets. The shaft is down 461 feet, it being intended to sink to 500 feet before crosscutting. At the 500-foot point a station will be cut and stopes opened and the extraction of ore for milling will be started. In the meantime a 30-stamp mill will be built, preparations for which are under way.

### El Dorado County.

Work has been resumed at the South Slope gravel mine, near Placerville, owned by A. S. Bosquit & Sons. The shaft is down 100 feet and will be put down 30 feet farther before crosscutting the channel is started. The mine is equipped with a steam hoist and pump.

The Ida Mitchell mine at Placerville continues work steadily. The 300-foot level has been reached, with a record of 75 feet for the past month. The average made is  $2\frac{1}{2}$  feet per day with a set of timbers put in every other day. The ledge shows a width of 32 feet, says Manager Jackson. A. M. McDonald is superintendent.

### Nevada County.

B. Wilkins, managing director of the Idaho-Indiana mine, at Grass Valley, has men at work repairing the pipe line and machinery, and says he expects to have the workings unwatered in four months. An electric pump will be put in.

The Ben Franklin mine, beyond the Bullion mine, near Grass Valley, is reported increasing developments. White Bros., who own the property, have done considerable work on the ground during the past few months and have taken out high-grade milling ore. They are arranging to put in a pumping and hoisting plant, preparatory to sinking 200 feet.

H. Huckins, owner, says the Quartz Quarry mine at North San Juan has been bonded to D. Nagle of Oakland, represent-

ing a Colorado company, for \$150,000. Operations will start this month and Huckins will have charge of the work. He will reconstruct the bridge across the North Yuba river at the mine, that was carried away by the high water last winter. Then he will resume sinking the shaft and will crosscut to the ledge.

Sinking has been resumed at the Bullion mine, near Grass Valley. The shaft is being sunk 200 feet and Superintendent Mainhart will open up two more levels below the 1300.

### Plumas County.

La Porte advises say that fire destroyed the buildings and machinery of the Bellevue tunnel near La Porte on the 17th inst. and imprisoned four miners who were at work in the tunnel. As no cave occurred, the men were readily brought to safety when the flames subsided. The compressor plant, blacksmith shop and other buildings were destroyed and the loss is estimated at \$10,000. The tunnel has been in course of construction to relieve the mining shafts of water that impeded development. The Thistle shaft filled faster than the pumps could remove the water, and the tunnel—3 miles in length—was run to take off the water. When the shaft was reached the floor of the tunnel was found to be several feet too high and men were lowering it when the fire broke out. The mine is in charge of C. B. Wingate.

### Santa Clara County.

A number of cinnabar and manganese mining claims in the Red Mountain mining district, east of Mount Hamilton, east of San Jose, have been conveyed by the Martel M. Co. to the American Manganese M. Co. of Oakland.

### Shasta County.

The Mariana Marsicana M. Co. proposes to improve its plant at Sunny Hill, near Redding. A quartz mill and cyanide plant are to be built.

J. E. Frick of Berkeley is reported, with San Francisco men, to have appropriated 40,000 inches of water to be taken from Rising river and Crystal lake, both tributaries of Hat creek, at a point 60 miles east of Redding, and used for producing electrical power. Work on the plant will start this summer.

The camps around Bully Hill (De Lamar) are reported active. At the smelter of the Bully Hill C. Co. there are two furnaces going at this time, when there never has been but one before. The second furnace was completed some months ago. After it was blown in the old one was cleaned and repaired. The railroad is being built to the Anchor mine from the smelter at De Lamar. The plans for the road provide for its extension to Copper City, a distance of  $1\frac{1}{2}$  mile from the Anchor mine. It is also said the railroad will finally be extended down the Pit river to connect with the Southern Pacific Railroad at Kennett.

### Tuolumne County.

(Special Correspondence).—At the Draper mine, near Soulsbyville, the 7-inch plunger pump recently got out of order and the water rose above it. Air was then turned into a small sinking pump. This failed to work, and a man sent to repair it dropped the cover into the shaft and the water rose and covered this pump also. A diver was secured from San Francisco who went down the shaft into a depth of 105 feet of water, removed the door, took a chip from the valve and replaced the door. He found the pump working when he came to the surface.

Soulsbyville, July 19.

Folcher & Divoll at the Hiapoo mine, near Columbia, are setting up an air compressor and hoist.

Ten men are kept at work at the Republic mine, near Columbia, and Superintendent Wilhelm has the 4-stamp mill pounding steadily, running through thirty tons of ore per day. He reports he can mill \$1.50 ore at a profit. It is intended to increase the milling facilities.

The Birney Wainwright claim on Bald Mountain, near Columbia, is idle, but operations will be resumed by August 1, says the Banner. Of the raise, started last season, 60 feet remains to be driven.

## COLORADO.

### Chaffee County.

The Turret district is shipping regularly to the Salida smelter, with prospects of an increase in output this summer, says the Post. Climatic conditions permit work the year round. Superintendent E. E. Briggs of the Mascot properties put additional men on the Copper King, the Vesper and other mines. The Copper King is said to contain a large body of low-grade copper ore. Engineer R. W. Huck will begin work on a concentrating mill for the Copper King. He has drawn up plans and specifications.

### Clear Creek County.

(Special Correspondence).—The Colo-

rado Central group on Leavenworth mountain, under supervision of M. Tong, is turning out its usual amount each month. This property has been one of the heaviest producers in the district in the past, and from the ore that is now in sight it is good for a number of years.

Some distance up the gulch from the Colorado Central, and 5 miles from Georgetown, is the Sidney tunnel, which is owned and operated by the East Argentine T. M. M. P. & T. Co. in the Argentine mining district. This company owns 400 acres and several thousand feet of development work has been done. They are laying a 2945-foot pipe line for developing power for their plant. Machinery will be installed for operating the mine, but they have not yet decided on the make of drills to be used.

Two miles from the Sidney is the Kitty Ousley and Tobin tunnels on the eastern slope of McClelland mountain. These properties are being operated by the Waldorf M. & M. Co. The Tobin tunnel is in 1200 feet on the lode. Work is being done under contract by L. Chiara. Electric drills will be added to the plant. This tunnel is 12,500 feet above sea level.—I. H. Stoll has the contract for sinking a shaft on the Kitty Ousley. In the bottom of the shaft he has struck a flow of water and a Cameron pump has been put in to handle the water.—The Waldorf company is putting in electrical power on its property for use in its mines.

The Stevens mine and mill are 8 miles from Silver Plume on western slope of McClelland mountain. This mine has 3 miles in tunnels and has produced \$3,000,000. They are putting 100 tons of ore through the mill per day. This property is owned and operated by the Waldorf company.

The Wilcox tunnel, which is being driven through McClelland mountain to connect with the Stevens mine, is in 3000 feet and being driven under contract by P. Hector at the rate of 6 feet per day. Power drills are used. When completed the tunnel will be 9200 feet in length. Thirty-seven veins have been cut in driving the tunnel the 3000 feet. Twelve of the veins have been developed to show up the ore. This plant is equipped with an eight-drill compressor. All of the property of the Waldorf company in the district is under the supervision of C. L. Tingle.

About  $\frac{1}{2}$  mile from the Wilcox mine is the Vidler tunnel, which is expected to cut through McClelland mountain into Summit county, and to be used for railroad and transportation purposes. It cuts the mountain under Argentine Pass, formerly used as a stage road between Georgetown and Leadville. This pass is 13,500 feet above sea level and said to be the highest wagon road in the world. It is the intention of Manager R. C. Vidler of the tunnel to extend the Colorado & Southern Railroad from Georgetown, a distance of 10 miles, on through the mountain to Keystone, making connection at that point with the railroad to Leadville.

Georgetown, July 17.

Work is being resumed on the property of the New York & Colorado G. M. Co., on Breckenridge mountain, 2 miles above Empire. The company has a tunnel site, in addition to several lodes, all of which will be cut by the tunnel. During the past winter work was suspended. The tunnel has been driven 100 feet and small streaks of mineral have been cut. However, no drifting has been done. The veins show values in gold and copper. C. H. Morris will be in charge of operations.

Work on the Vice-President property on Sherman and Brown mountains, near Georgetown, is being resumed. This mine is operated by a tunnel, the mouth of which is under the Seven-Thirty and running in a parallel direction. It has been closed down for several years on account of litigation.—The New Era M. Co., which has a number of claims in Grizzly gulch, is doing considerable development work. A tunnel has been driven 2000 feet and a number of lodes have been cut, carrying values in gold, silver and copper.

C. I. Burt, interested in the Vulcan group of mines at Silver Plume, states he expects to resume operations this week. The Vulcan is contiguous to the Pay Rock, Snowdrift and other producers.

### Dolores County.

The San Juan Ore Co., lessees of the Pro Patria M. & M. Co.'s mine and mill, near Rico, has millmen at work remodeling the mill and putting in Frue vanners. Work at the mine is progressing satisfactorily and the force of miners is being increased.

Men are excavating and grading for a pipe line from the water supply tank above the Group tunnel, near Rico, to a point 700 feet down the mountain, where a power station is to be built. The vertical fall of the water will be 300 feet. The

pipe used will be 12, 13 and 14 inches in diameter. A 6-foot tangential water wheel will be put in and the power transmitted to the mill by cable. The change from steam to water power will mean a saving of \$25 per day to the lessees of the mill, says C. D. Hooper, who has charge of the plant.

E. A. Thayer of Denver, of the Rio Dolores M. Co., is reopening the Sydney group of mines (formerly the Government group), on the western slope of C. H. C. hill and adjoining the Rio Dolores Co.'s properties on the south, near Rico. J. W. Winkfield is superintendent.

The Intrinsic G. M. & M. Co. owns six claims on Sambo hill, or northeastern slope of Expectation mountain, viz.: The Sambo, Intrinsic, Lake View, Gulch, Mt. Wilson and Trust, covering fifty acres of mineral ground near Rico. Two of the claims are patented. The officers of the company are D. Swickhimer, R. Mylerain, A. V. Gorla, J. H. Goodknight and T. R. Thompson, the last named being superintendent. It is intention of the Intrinsic G. M. & M. Co. to extend the main tunnel on the Sambo claim into the mountain to intersect a known fissure and then raise an approximate distance of 75 feet to the contact ore body in an upper level. This tunnel has reached a horizontal depth of 600 feet and it is estimated the vein will be struck within 400 feet.

#### El Paso County.

The Portland mill, at Colorado City, which treats the ore shipped from the Portland mine, at Victor, is resuming operations after having been closed down for several weeks. Delay was made in starting up the mill, as the management desired to get a reserve tonnage on hand to lessen chance of having to close up the mill again. The Portland mill handles 8000 tons per month, although about 1000 tons more can be treated if necessary. Some of the ore, it is said, goes to the smelter for treatment. The Portland mill is owned and operated by the Portland company, and treats only Portland ore. The Portland mine is employing 480 men, and is producing 325 tons per day, or a total of 9750 tons per month, said to average \$30 per ton.

#### Fremont County.

The co-operative plan of mining coal adopted by the Cuckoo Coal M. Co., near Florence, is reported proving a success, says the Times. This company bought the Cowan mine and sold interests in it to miners for \$100 per share. These certificates run for twenty-five years when they are taken up for cancellation. The mine is worked on a union basis, eight hours a day, 20% increase and no company store scrip. The miners are profit sharers.

#### Gilpin County.

A six-months' option has been given to G. W. Adams on the Hall lode, near Russell Gulch, for \$12,000. The lessee contracts to sink the shaft, at present 130 feet deep, another 100 feet, and to drift 50 feet each way in the 120-foot levels. The milling ores range from two to four ounces gold per cord, while the smelting ores run \$50 per ton.

At Idaho Springs the Jackson concentrating works has been leased for one year to G. K. Kimball, and will be used for the treatment of ores from the Old Town mine in Russell Gulch.

The Jumbo Mountain M. Co. has been organized to enter Rollinsville section by Idaho Springs parties. They have taken up a group of claims and two mill sites on the west slope of Jumbo mountain in Independent district and have started a tunnel to cut the group at depth. F. M. Noonan is in charge. Decatur, Ill., parties are interested in the Pioneer group in Moon gulch, which is being developed through a tunnel, now in 375 feet. It is intended to erect a milling plant before fall. Centerville, Ia., parties are interested in the Mountain Monarch Co., operating in Gambell gulch, and developments progressing under management of F. Augustus. The main tunnel is in 450 feet; work has been temporarily suspended there, but will again be resumed. Drifting is in progress on a blind lead and they are crosscutting from the Chieftain vein for the 12-foot vein. There are 5 feet of the Chieftain ore in sight. The main tunnel of the Swiss Co. in Moon gulch is in 525 feet, and another contract for 50 feet is to be let.

#### Gunnison County.

The Camilla M. Co., with D. H. Moffat et al., of Denver, interested, is carrying on developments 2 miles east of Sherrod, across the divide. A. A. McKnight is superintendent. The company has put in a mining plant and started a 3000-foot tunnel into Pomeroy mountain. It is in 330 feet, and at 1500 feet the manager expects to cut the main vein at a depth of 1000 feet. The company owns twenty-four lode claims.

The compressor from the West Moun-

tain power house and the boiler from the Silver Basin shaft are being transferred to Ohio creek to be placed for running the tunnel through the Gold Links and Demurrers groups, near Pitkin. This tunnel will be 5½ by 7½ feet in the clear, and will be run at least 2000 feet, cutting several known veins before reaching the Sacramento-Corydon vein at a vertical depth of 1000 feet. J. F. Pearson is in charge of the work.

#### Lake County.

One result of the exploitation of the northern and western slopes of Big Evans gulch at Leadville by the Fryer Hill M. Co. through the Harvard and Pride of the West shafts, has been a renewal of interest in the properties lying to the west of those shafts, says the Carbonate Chronicle. Near the Pride of the West and to the northwest is the Cady shaft of the Progressive M. Co. Exploration has been continued there with a few men under Manager Butler. A short distance northwest from this property is the Oolyte M. & I. Co. group of claims, including the Tabor, Zoo, Oolyte and Bush claims. The Oolyte Co., composed of Leadville men, secured control of the four claims named and is preparing to carry on development. H. R. Pendery is vice-president of the company and G. E. Eason, secretary. The group is northeast of the Poverty flat section, due north from the Little Chief and near the Progressive hill mines. It is believed that it will not be necessary to sink the shaft more than 250 feet to strike the ore horizon. The old shaft on which the company has done some work in the past few years is in good condition.

#### San Juan County.

The two drifts extending from the bottom of the Esmeralda shaft, near Silverton, measure 200 feet each and are in ore of from 5 to 6 feet in width. No ore is being broken, the work being done for development only. The shaft, which is 225 feet deep, will be put down 100 feet deeper. Superintendent Glanville has twenty-four men at work.

#### San Miguel County.

The Mayflower G. M. Co. has completed overhauling of the Philadelphia 10-stamp mill at the head of Bridal Veil falls, near Telluride, on which it has a lease for treatment of Mayflower product. Pack trains are carrying mineral from this company's property, in Bridal Veil basin, to the plant, says Manager E. L. Davis of Telluride.

The Smuggler-Union M. Co. at Telluride, B. Wells manager, whose properties were closed last month, due to the labor situation, has a few men working in its mines in Marshall basin, and a portion of one of its mills at Pandora—2 miles above Telluride—continues to operate on Smuggler-Union ore. It is understood the men in the mines are breaking down and taking out ore which had been stripped and left standing in the vein on the ninth level and removing broken mineral from the chutes and manholes in other parts of the property. Reports say that portion of the Smuggler-Union mines which has been operated by the company will be leased. It is also said that, in the event of the mines not being leased, the company will resume operations inside of two months on a more extensive scale than heretofore. A few men will be kept on development meanwhile, says Manager Wells.

J. & G. Wagner, who have a lease on the Smuggler, Sheridan and Union dumps, and the 76 claim in Marshall basin, properties of the Smuggler-Union Co., near Telluride, are preparing to send down over the company's tramways enough mineral to regularly supply thirty stamps of one of its mills at Pandora. They expect to keep seventy-five men at work.

#### Summit County.

(Special Correspondence).—From the Wilcox and Vidler tunnels in East Argentine to the top of the range is 2 miles. From the top of Argentine Pass can be seen Gray's and Irving's peaks, and 4 miles down the valley is the mining camp of Argentine, formerly called Decatur, and then changed to Rathbone. (See illustration page 56). The Continental Divide is crossed at the top of the pass. In the "amphitheater," or "horse shoe," some prospecting is being done. W. Farager of Georgetown has a lease on some property in the "shoe" and is shipping high-grade ore. The second grade ore is said to run \$1.25 per pound. —J. Robinson, owner of the Bonnie Bell, has a tunnel on his property 400 feet in length and taking out ore.

W. B. Le Wald, manager of the Ohio M. Co., is operating the Ohio and Pennsylvania mines and mill. (See illustration page 56). This company owns 215 acres. He is running a drift from the Ohio to cut the ore bodies of the Pennsylvania at a depth of 250 feet. The Penn-

sylvania is an old producer. At present he is running the dumps through the mill and is turning out eight tons of concentrates per day. He is putting in a steam plant to enable them to operate through the winter. A two-bucket tramway is being erected from the Ohio to the mill. Ore bin capacity will be increased. On the Ohio they have a crosscut in 800 feet, which cuts the Pennsylvania at 360 feet, and by running 750 feet farther they will cut twelve more veins from 700 to 1500 feet in depth. The company is owner of water rights on Snake river, North Fork and Bear creek, capable of generating several hundred horse power. They will install an electric power plant.

Argentine, July 17.

(Special Correspondence).—Four miles around the hill from Argentine is the camp of Montezuma. (See illustration page 56). This camp is capable of producing a large amount of zinc if the mines were worked. A. L. Jourdan has shipped several tons of zinc concentrates, which run from 47% to 50% zinc and 15 to 20 ounces in silver. This was taken from the dump of the Belle mine.

W. F. Parker, manager of the Glacier Mountain M. & M. Co., is putting up a small test mill for handling ores from its mines. He states he will put in 1500 feet of 15-inch pipe line and a water wheel.

One-half mile down the creek from town is C. H. Campbell operating the Fisherman G. M. Co. He has one tunnel on the property on Bear mountain 635 feet in length and is taking out a good grade of mill dirt. He has a 5-foot streak that he says will concentrate three tons into one. The ore carries zinc, iron, lead and some gold.

Montezuma, July 17.

(Special Correspondence).—The Summit M. & S. Co. are opening up good ground in the upper workings and have about 600 feet of development work. The mill will be overhauled and put in shape to treat the zinc ores. This property has been the main producer of the district. On account of the smelters not requiring sulphide ores, they are unable to ship as much as the mine is able to produce. E. E. Byron is manager.

The Delaware M. & M. Co. on Elk mountain, and adjoining the Summit county, is shipping 30 tons per day.

Kokomo, July 17.

(Special Correspondence).—W. E. Thorne, manager of the Oro Grande Placer M. Co., is getting the plant ready for operation. To reduce the lift he has added another flume. The lift was formerly 102 feet from the bottom of the pit. It is now 76 feet. By reducing the lift the capacity of the plant has been increased about 30%. The company expects to put in a power plant at junction of Rock and Boulder creeks and the Blue river, where they have a good water supply.

Dillon, July 18.

The King Solomon T. & Dev. Co., at Frisco, will improve its water power and open up its placers in addition to increasing work on its main tunnel. In this tunnel they expect to cut a body of high-grade ore in the next 250 feet.

#### Teller County.

The St. Patrick M. Co. of Scotland has bought the St. Patrick mining claim in Victor.

G. Jordan, who last summer treated the tailings of the Summit dump by cyanide process through the Summit mill, which he converted into a cyanide plant, has resumed operations on the balance of the tailings. His plant is small, ten tons being treated daily.

J. Wright, formerly leasing on the Thompson claim of the Elkon Co., who has a lease on the Zenobia and Ajax claims on Beacon hill, Cripple Creek, has started operations.

Assistant Secretary C. Fitch of the Mine Owners' Association, says the association had last week issued 3700 recommendation cards to miners and engineers since April 1st last. Since June 8th there has been issued 1100. It is a compulsory measure adopted by the association, and unless a man has such a card showing that he is all right, both as to character and ability, work is forbidden on any of the association mines, and now all mines are governed by the association. He stated there were about 350 applications on file which had not been acted upon. If all of these were reported upon favorably there would be not less than 4000 men carrying cards in the district. The camp never had more than 4000 men, so it would seem as if the usual number of men were at work.

Harrison & Seaver, on the W. P. H. mine, on Ironclad hill, Cripple Creek, sent out 1000 tons of ore during the month of June, which gave an average value of \$55 in gold per ton, or a gross production of \$55,000. The vein varies in width from 4 feet to 15 feet. This ore is being

mined between the second and third levels, and Harrison & Seaver are employing twenty men.

The Blue Flag G. M. Co., operating on Raven hill, Cripple Creek, is preparing to put in more machinery, including a compressor, boiler and hoist. A shaft has reached a depth of 150 feet and it is intended to cut stations every 100 feet as depth is attained, from which points levels will be run.

F. Finnegan of Colorado Springs, owner of the Savage claim, north of the Mabel M., on the east slope of Beacon hill, Cripple Creek, says he will resume operations on the property. The shaft on the Savage claim has been sunk to 340 feet and some lateral work done.—Beacon hill is a lively section of the camp, and at the present time it is estimated the west slope, along which are to be found the El Paso, C. K. & N., Old Gold, Henry Adney and Lonaconing, is sending out a trainload of ore per day. There are said to be several owners who are contemplating either giving leases or starting up on personal or company account.

Though June was a short month, owing to closing down for a week on account of the Independence depot disaster, the production for the month indicates that more men are at work than formerly, and that the payroll was as near to the normal as the production. A disbursement of \$460,000 was made in the district, says the Cripple Creek Times.

The El Paso Con., on west slope of Beacon hill, Cripple Creek, shipped out 900 tons of ore during June which gave average values of \$110 in gold to the ton, says the Times. The ore is being mined exclusively from the third level, although there is ore on every level. Manager Bainbridge is working 125 men. Men are being put to work crosscutting from the seventh and eighth levels. They will crosscut for the ore bodies found in the upper levels. After this work is completed the sinking of the shaft will be resumed.

## IDAHO.

#### Blaine County.

W. Shakespeare at Carrie Town, on the Little Smoky river, near Hailey, is reopening the Carrie Leonard and the Fisher groups of mines, on which he has lease and bond.

C. M. Schwab of Pittsburg, Pa., has closed his option on a majority interest of the Minnie Moore mine, says the Hailey Times. I. E. Rockwell, who unwaters and reopened the mine after it had been closed for years, retains an interest and will continue in charge.

The Miles group of claims, near Muldoon, near Hailey, is reported improving. It is the eastern extension of the Muldoon claim, being between it and the Argosy group. It shows a 6-foot vein of lead carbonate and galena between well-defined walls, and a shaft 33 feet shows ore. The group consists of four claims and is owned by J. J. Plumer, T. Miles and J. J. Baker.

#### Boise County.

The claims on a fork of Alder creek, bonded by the Overlook M. Co., will be worked. They will place the mill, now at Neal, on the property. The mill has a capacity of fifty tons daily. The company will dig a ditch from West creek to the properties.

The men who are ground sluicing in the old Banner mill, near Idaho City, for quicksilver and amalgam report getting 125 pounds a day, a portion of which is silver amalgam. About a month will be required to complete the work.

#### Idaho County.

L. C. Van Riper, manager of the Wendenhoff mine at Big Creek, 35 miles from Warren, has work under way on the mill and cyanide plant. A 20-stamp mill will be put on the Empress mine.

W. H. & W. C. Colwell and J. Downall of Tampa, Florida, are reopening their mining properties on War Eagle mountain, near Warren. A hand power drill is being used. The properties consist of six claims on north slope of War Eagle mountain at head of Grouse creek 7 miles from Warren. A tunnel has been driven on the John D. claim. Work will be done later with an electric drill.

#### Owyhee County.

The Homestake mine, near Silver City, has been leased to S. Longfellow, and men under M. White have begun development work in sinking and putting up buildings.

#### Shoshone County.

During June the Bunker Hill & Sullivan mine at Wardner shipped 6000 tons of concentrates and ore, said to be the largest monthly shipment ever made from a single mine in the Cœur d'Alenes.

Under E. P. Spaulding, sixteen men are working on the Monarch group of claims, near Mullan, which had lain idle for several months. Preparations are being made to ship ore from the 300-foot level.

There are 40 feet of ore. Since work has resumed it is thought a shaft will be sunk on the ledge. Many of the claims that now compose the Monarch group were formerly known as the Barton group. In the Monarch group are fourteen claims, which are 4 miles east of Murray.

The Ruth M. Co. on Nine Mile, 2 miles from Wallace, will begin a lower tunnel August 1. It will put in a compressor. Among the principal stockholders are O. Wallace, J. McLaren and D. Genoway.

#### Washington County.

A strike is reported on at the Ladd Metals Co. smelter and mines at Mineral. The muckers and topmen went on a strike against a reduction of wages, and the miners walked out in sympathy with the movement. Manager McDowell says the wage scale proposed for the muckers and topmen is the same as was in force last summer. The winter wages of this class of workmen was voluntarily raised by the company, and that now the old scale will be adopted. It is reported that the company has suspended operations indefinitely with the hope of eliminating ill feeling said to exist among the workmen, and with a further view of ridding the camp of an undesirable class of people.

### MONTANA.

The annual report of B. H. Tatem, assayer in charge of the United States Assay Office in Helena, for year 1903, has been issued, showing total production of the State \$50,276,355, an increase of \$3,315,188. Gold and silver being computed at coining rate for each and the copper and lead at the year's average price, the production was as follows: Gold, fine ounces, 222,066,236; value, \$4,590,516.31. Silver, fine ounces, 13,224,004.22; value (coining rate), \$17,097,702.43. Copper, fine pounds, 213,076,628; value, at \$13.325 per cwt., \$28,200,691.72. Lead, fine pounds, 9,144,313; value, at \$4.237 per cwt., \$387,444.54. Total, \$50,276,355. The increased market prices paid for copper and lead stimulated the production of these metals. Silver shows a decrease of 400,000 ounces from the 1902 output. The average price paid for electrolytic copper (the Montana product being of that kind) was \$13.235, against \$11.626 for the preceding year, while the price for lead was \$4.237 against \$4.069 per cwt. in 1902. Copper is the principal feature of the mining industry in Montana. More than 80% of the total values won in the State during the year 1903 came from the mines of Silver Bow county, around Butte, in the shape of copper, gold, silver and some lead.

The production of gold and silver by counties was:

Counties.	Gold, Fine Ounces.	Silver, Fine Ounces.
Beaverhead	3,969,473	154,918.39
Broadwater	3,958,546	61,940.24
Cascade	712,929	261,339.56
Choteau	3,412,940	5,992.90
Deer Lodge	3,418,615	12,463.21
Fergus	54,734,690	12,010.39
Flathead	2,225,004	110,132.61
Granite	9,170,293	1,429,456.30
Jefferson	12,312,621	237,362.81
Lewis & Clarke	22,399,156	143,050.37
Madison	30,257,680	128,301.78
Meagher	400,520	88,008.38
Missoula	4,285,954	1,035.78
Park	9,992,864	3,350.53
Powell	3,272,344	20,396.43
Ravalli	706,490	2,193.50
Silver Bow	48,800,775	9,811,544.69
Returns from custom smelters, mints and assay offices, impossible to classify by counties.	8,844,781	746,596.37
Totals	222,066,236	13,224,004.22

The sources of gold and silver were divided thus:

	Gold, Value.	Silver, Value.
Placer dust	\$ 481,446.65	\$ 3,321.71
Mill bullion	1,033,862.75	1,912,448.72
Cyanide bullion	1,315,767.94	154,918.39
From copper ore	1,250,881.12	11,225,913.60
From lead ore	123,056.95	582,209.47
From smelting ore	375,500.91	3,319,207.43
Totals	\$4,590,516.32	\$17,097,702.43

By counties, the production in fine pounds of copper and lead was:

County.	Copper.	Lead.
Beaverhead	118,755	506,540
Cascade		950,348
Broadwater		4,000,040
Flathead	15,500	48,709
Granite	245,000	329,971
Jefferson	57,500	72,969
Lewis and Clarke		79,613
Madison	6,200	630,000
Meagher		28,068
Ravalli	210,933,785	209,500
Silver Bow		
Custom smelters in addition to the above not possible to classify by counties.	1,732,888	1,387,329
Totals, pounds	213,106,628	9,144,313

The diminished yields shown for copper and smelting ores was governed largely by a lower percentage of the metal contained in the ores mined and by local conditions within the State, which necessitated closing down on several occasions of the prominent producers. During 1903, the prosperity of Butte, the largest mining camp in the State, was interrupted on two occasions. The first was the closing

down of some of the principal producers early in July to permit of the finishing and connecting of the new flue and stack of the Washoe smelter at Anaconda. The second was caused by mining litigation which caused a cessation of work at the mines and smelters of the Amalgamated Co. from Oct. 22 to Nov. 11, and was remedied by measures passed by the Legislature.

#### Deer Lodge County.

J. Ducie of Anaconda has bought the Nelson interests in the Montana mine at Georgetown for \$2000. The shaft of the Montana mine is down 65 feet. A vein has been exposed. The hoist has already been put up and the shipping of ore will be begun this week.

M. Johnson of Anaconda, part owner of the Long Spring mine in Moose Lake district, reports that a strike of lead and silver ore has been made. Development work will be increased. The other owners are J. J. Harper and J. Long of Anaconda. Assays show a value of \$100 per ton in lead, silver, gold and copper.

Mining is reported improving around Anaconda. Work is ready to begin at Danielsville on the group of mines bonded for \$60,000 by Eastern men, and under direction of Manager F. Murphy. The Danielsville M. & M. Co. is also doing work. At Georgetown, Cable and the Southern Cross district work will again be going full blast. The Blue Eyed Nellie district will be worked as usual and ore shipped from the mines.

#### Fergus County.

G. A. Wells, part owner of the sapphire mines at Yogo, near Utica, says the mines south of Great Falls supply 90% of the watch jewels of the world. There are seventy-five men working in the mines and the output is increasing. The stones are blue and are shipped to London in the rough state for cutting and sale. During the past year the company's sales were \$300,000 worth of sapphires. These Montana sapphires are used largely in the manufacture of watches for the reason that the smaller pieces are about right for such purposes with but little cutting and practically no waste, says Wells.

#### Granite County.

J. W. Haggerty of the Montana G. M. Co. of Butte says it is proposed to resume operations at the Sunday mine at Royal, near Phillipsburg. A stamp mill will be built.—The Gold Reef properties on South Boulder creek, which were closed down last fall owing to lack of water for milling purposes, will resume operations this month. Manager L. U. Loomis states that the mill and equipment of the Mary Jane Co. at Boise, Idaho, has been bought by him and will be moved to the Gold Reef. The plant will be operated by steam power and will be set up about 2 mile from the mines.

#### Madison County.

The Green Campbell Con. M. Co. has been incorporated to work the Green Campbell and several other adjoining claims in the Silver Star district. The Green Campbell was formerly worked to a depth of 200 feet. No attempt has been made to open the property in later years, work at present being confined to the Edgerton and Eagle claims, on which the company has a bond and lease. A shipment of fifty tons is being made from these claims to the Watseka mill at Rochester for test purposes. An incline shaft on the Edgerton has been extended from a depth of 90 feet to 260 feet. It will be continued 100 feet deeper. Twelve men are working under Superintendent B. C. Leyson. On the Green Campbell is a tunnel 1000 feet long, opening the vein at a depth of 100 feet. E. B. Howell of Butte is president.

On Mineral hill the Bozeman group, owned by J. McKitterick of Pony, has been bonded by J. Miles et al. of Pony and J. J. Cusick of Butte. Operations will be increased.

The Duncan Bros. 10-stamp mill on Norwegian gulch has been leased to Micklejohn & Wishom, and started up last week on ore taken from properties in Norwegian district, near Pony. It is intended to make a cyanide test of the Norwegian ore, and if these tests prove satisfactory, a plant will be built.

#### Powell County.

C. S. Loring has shipped the machinery of his concentrating plant from near the Silver King mine of Park City, Utah, to Emery, 9 miles from Deer Lodge. He expects to have his mill in operation on his Emery holdings by next month.

#### Silver Bow County.

Butte reports to the Daily Mining Record give the following figures showing the net earnings of the Butte mines for the year ending June 1, 1904, as compared with the previous year. The figures are complete for the district, with the exception of the Hypocra M. Co., one of the

Heinze corporations. When that company makes its report the total net earnings are expected to equal those of last year. The showing is considered good in view of the fact that the Anaconda mines were closed down for a long time last year and later all the mines of the Amalgamated sub-companies also suspended operations for three weeks or more.

	1903.	1904.
Boston & Montana	\$4,053,465	\$4,574,408.12
Anaconda	1,601,200	1,259,875.91
Butte & Boston	202,410	10,853.48
Parrott	586,365	233,064.68
Colorado	43,090	74,833.35
Colusa-Parrott	245,785	244,794.00
M. C. P.	601,250	459,113.30
Johnstown Co.	106,765	80,113.26
Speculator		223,737.63
Goldsmith Mine.		111,500.73
Allice		4,045.07
Lexington		637.00
Miscellaneous	1,450	1,643.97
Totals	\$7,441,800	\$7,345,010.34

\* Listed this year as the Original M. Co.

Butte reports say the Parrott M. Co. has brought suit against F. A. Heinze et al. in the District Court to recover the sum of \$2,200,000 and costs. The suit was brought to force Heinze and his fellow defendants to pay for ore which they are charged with taking from the Little Mina mining claim of the Parrott company. It is charged that the defendants entered the Little Mina ground by means of the workings of the Nipper claim.

### NEVADA.

#### Esmeralda County.

The Goldfield Mohawk M. Co. has been incorporated under South Dakota laws to develop three claims at Goldfield known as Mohawk Nos. 1 and 2 and Slim Jim Fraction, which adjoins the Combination, Jumbo and Red Top mines. The officers are: H. Ramsey, G. Wingfield, H. H. Brown, G. S. Nixon, J. H. Forman, A. C. Eisen, A. D. Myers. Four leases have been granted on the group.

#### Eureka County.

W. C. Rose, of Hamilton, says he has suspended work on the Hamburg mine on Prospect mountain, near Eureka. He had four men sinking a shaft and was down 70 feet.

#### Lincoln County.

Caliente reports say J. Weiser of New York has an option on J. Hullicks Sun Set group of claims, 3 miles north of Bitter Springs and 14 miles south of the San Pedro right of way, between Moapa and Las Vegas ranch. Assay reports show \$16 free gold from ore taken from the group. A 3-foot ledge is showing at a depth of 60 feet on the May Day claim, and a 23-inch ledge on the New Year's claim in the same group, but on another contact carrying gold and silver values. Weiser also has an option on the Never Sweat salt mines, 16 miles east from the Sun Set group, which will be developed. All that is restraining development is the lack of railroad facilities, which will be overcome when the San Pedro shall have reached a point half way between Moapa and Las Vegas ranch.

#### Nye County.

The Liberty mine, near Tonopah, under management of W. C. Wynkoop, is being developed. The shaft has been continued to a depth of 258 feet and drifts have been run for 200 feet west on the 145, 200 and 258-foot levels, the vein varying from 6 to 8 feet in width and averaging \$30 per ton in silver (in form of chloride) and \$1 per ton in gold. This vein is in line dipping at an angle of 43° toward a porphyry and lime contact. A main hoisting shaft will be started and a steam hoist set up. Plans for a mill are being formulated. Water is at hand, but crude oil will be used for fuel. High-grade ore has been sacked from development work.

Superintendent F. B. Work reports progress in development of the Hannanah mine, 18 miles east of Tonopah. During June he extended the drift 52 feet, the last 4 feet showing 10 inches of ore carrying a sprinkling of ruby silver.

#### Storey County.

Fire starting in the rope house of the Union mine at north end of Virginia City last week caused a loss of \$125,000, destroying the entire hoisting plant. Through the Union shaft, the Scorpion and Sierra Nevada mines are worked. Miners were at work in the mines at the time. Their only escape was through the Union shaft. The engineer remained at his post until the last cage was hoisted and no one was injured. Superintendent A. J. McDonell says the plant will be rebuilt.

### OREGON.

#### Grant County.

(Special Correspondence).—The Copperopolis C. Co., at the annual stockholders' meeting at Portland last week, elected the following directors: W. W.

Gibbs, M. A. Butler, A. C. Lindsay, H. W. Prettyman, of Portland, and M. Marks of Omaha, Neb. W. W. Gibbs is president. The company's property is in Quartzburg. Operations are progressing. Quartzburg, July 19.

Addition of stamps to the Dixie Meadows mill, near Prairie City, will be made. The ore mined there with higher values is very hard, being a bluish quartz. It is said that stamps will be put below the two sets of rolls now in use, using the gyratory breaker, roll-jaw breaker and ruffing and finishing sets of rolls for the first crushing and the stamp batteries for the last. As originally designed, the Dixie Meadows plant was a concentrator, and calculated to save on plates but little of the free values. Ore is delivered to a No. 2 gyratory breaker, where the size was to be reduced to about 1½ or 1-inch pieces, and thence to a roll-jaw breaker, where ½-inch product was expected. The first set of rolls, which have been run at about 350 revolutions, next received the ore, and the finishing set, running at 650 to 750 revolutions, brought the product down to 10 to 20 mesh. The pulp passed over plates immediately below the batteries and thence to concentrators. A Huntington mill was put below the rolls as a finishing grinder, and by means of it the management was able to increase the output materially, and would continue work steadily but for the excessive abrasion of the faces of the rolls.

G. J. Barrett and G. L. Lindsay have a bond on the Wolverine group on Boulder creek, 4 miles from Granite. The Wolverine group contains three claims and a millsite, also a water right in connection. W. H. Robinson is owner. There are two veins reported on the property, one 2½ feet wide and the other 8 feet wide. These veins are 100 feet apart and have been proved up on the surface by open cuts for 700 feet, showing values in free gold. They are preparing to sink a shaft on the principal vein, and after the veins are more thoroughly prospected a tunnel will be started to open up the ledges in depth.

Granite reports say the Comstock mine, ½ mile from the Red Boy, has been sold to men who will increase development work. W. J. Keough is in charge of the mine. The vein will be drifted on both ways from the crosscut and a raise run to the surface.

The Middle Fork Electric Power Co. has been organized at Prairie City for installing an electric power plant on the middle fork of the John Day river, to generate 700 H. P. to be used for lighting and operating the Dixie Meadows mine and other purposes. The officers are: R. C. Reese, F. Newman and V. C. Belknap.

#### Baker County.

A. M. Paul, superintendent of the Imperial mine, near Sumpter, says a mill will be put on the Imperial this summer.

#### Jackson County.

Men are at work getting out timber for a complete rebuilding of the Shorty Hope mine shaft, near Ashland, from the surface down to the Golden Spike level. This will be a two-compartment shaft. A station will be made at the intersection of the Shorty Hope crosscut and necessary machinery placed at this point for sinking several hundred feet on the ledge, which is nearly vertical. It is intended that the shaft repairs will be completed and sunk to the Golden Spike level before the tunnel reaches the intersection.

#### Josephine County.

W. C. Slade, who has a placer mine on Johnson gulch, a tributary of Sucker creek, near California Bar, near Grants Pass, reports he has also located a 4-foot ledge of gold-bearing quartz on his placer claims. He has found indications of quicksilver ore deposits. A find has been made on Sucker creek, near California Bar, by J. Burnett. He has two ledges running parallel.

Grant's Pass reports say a 5-stamp mill and equipment, formerly used at the Granite Hill mines, are being moved across the gulch to the Red Jacket claim of the Granite Hill Co. The mill is replaced at the Granite Hill by a 10-stamp battery, with four Frue vanners. The new mill has begun operations. The Red Jacket claim has several ledges of from 2 to 6 feet width, carrying values. It is intention of the American G. F. Co. to operate the Red Jacket separately, but later in conjunction with the Granite Hill. As development proceeds, the two will be united, says Superintendent Wickersham.

#### Wallowa County.

A. J. Murphy et al. have organized the New York C. M. & M. Co., to operate a group of copper claims on Snake river, 1 mile from the Eureka group, near the mouth of the Imnaha river, near Imnaha. The men are largely of Lewiston, Idaho. It is intended to open the property rapidly.

A. P. Lester of Joseph of the Tender-

foot M. Co., and manager of the interests of the Badger M. Co., reports work progressing. President E. R. Tripp of the Tenderfoot is arranging for a 20-stamp mill complete, including a cyanide plant, for that mine, and the machinery is to be delivered and set up this year. Lester says the Tenderfoot and Badger are on the north slope of the Wallowa (or Eagle) range and 20 miles from Joseph. The district is on the headwaters of the Imnaha river, at the mouth of which is the Imnaha copper district. Though on the Imnaha, the properties find their outlet through Joseph, and thence to the O. R. & N., and Lester says it is proposed to ship out a small quantity of ore this year to the smelter. To do this there will be a 90-mile wagon haul, then a rail haul on the narrow gauge road from Elgin to La Grande, thence over the O. R. & N. to Baker City, and then the Sumpter valley to Sumpter. It will have to be \$50 rock to pay this haul, but both the Tenderfoot and Badger can output some this year. The ore carries gold values. Preliminary to building the mill and starting heavy work, the companies have spent approximately \$20,000 on wagon roads connecting the new district with the wagon roads of Wallowa county.

## SOUTH DAKOTA.

### Custer County.

The Extreme M. & M. Co. is operating its mine and mill, 3 miles from Custer, with satisfactory results, says the Review. The mill has ten stamps, amalgamating plates and concentrators. The concentrates are being held for shipment to a smelter.

The Ruberta M. Co., whose superintendent is W. W. Olds of Custer, expects to have its 10-stamp mill running next month. A cyanide plant will be used for treatment of tailings following amalgamation.

### Lawrence County.

A bar of gold bullion, value \$11,000, was shipped last week by Superintendent O. B. Ansdren from the Clover Leaf mill at Roubaix, as a result of seven days run of the 60-stamp mill.

The Custer Peak M. Co., near Custer's Peak, near Terry, has its hoisting machinery set up and expects to resume sinking next month. The plant consists of a 75 H. P. boiler and single drum hoist. The shaft is 75 feet deep and will be continued several hundred feet, making cross-cuts at intervals.

The Dakota M. & M. Co. proposes using electric drills at its mine near Portland. Negotiations have been under way for securing electrical transmission line. The Belt E. L. & P. Co. has such a line to the Lundberg, Dorr & Wilson plant near Terry, and it is stated the company will continue this line to the Dakota property. The object of the company in adopting electric drills is chiefly to avoid the necessity of building a power plant on its property. Such a plant would require a larger amount of water than the company has available at present. The Dakota company's cyanide plant at Deadwood is in complete running order and all of its stamps are dropping.

The Globe G. M. Co., operating near Lead City, proposes to build a mill at its group of mines. Contract has been let for 40,000 feet of drilling on the property of the Deadwood Standard G. M. Co., near Cyanide, in the Ragged Top section west of Lead. The work will be done with a churn drill.

Superintendent O. N. Brown says the Spearfish mill, at Spearfish, is treating from 6000 to 6500 tons of ore each month. A day's run at the plant is about 250 tons. Some time is lost each month through necessary shut-downs while the rolls are being shelled or other repairs made. Clean-up is made twice a month.

### Pennington County.

The Rochford district, both east and west, is receiving attention this season, according to Deadwood reports. In the Hornblende camp, 4 miles west, the Black Eagle M. Co. is completing a 10-stamp mill. The company has a vertical vein of free milling ore 30 feet in width that assays \$6 in gold. The property adjoins that of the Golden West M. Co., which is also a producer. The Black Eagle M. Co. is capitalized by Indiana men. It is expected the Golden West Co. will build a 50-stamp mill on its property this season. The company has a large vein of free milling ore.—A strike of free gold ore has been made by J. Craig et al. east of the Cochran mine. A strip 40 feet in width and several hundred feet in length is said to pan at the surface \$3 a ton. A tunnel was run in, which cut the vein.

J. Cochran, who owns the mine 3 miles west of Rochford, is preparing to start his Huntington mill. A year ago his property was bonded to Eastern men, who made first payment, and while sinking the shaft deeper the vein dipped out of sight and the property was abandoned.

The owner has since crosscut from the bottom of the shaft and found the vein. The vein is said to be 75 feet in width, carrying free milling gold values.

## UTAH.

The following statistics of the metal production for the calendar year 1903 are shown by the annual report of B. H. Tatem, assayer in charge of the United States assay office at Helena, Mont. The value of the gold, silver, copper and lead was the largest in the history of the State—detailed as follows:

	Quantity.	Value.
Gold, fine ounces.....	237,233.844	\$ 4,905,092.38
Silver, fine ounces.....	19,571,766.99	25,304,910.83
(coining rate).....		
Copper, fine pounds, at \$13.235 per cwt.....	33,552,692	4,440,698.79
Lead, fine pounds, at \$4.237 per cwt.....	109,765,257	4,650,753.94
Total.....		\$39,301,455.94

The total output being an increase of \$11,419,302 over the value of 1902 output.—By counties, gold and silver was divided as follows:

	Gold.	Silver.
	Fine Ounces.	Fine Ounces.
Beaver.....	1,336.000	296,027.00
Box Elder.....	6,100.000	7,280.00
Iron.....	3,102.320	24,410.30
Juab.....	44,837.867	4,565,950.19
Plute.....	22,262.600	67,109.14
Salt Lake.....	57,327.157	3,215,252.84
Summit.....	24,325.290	8,810,850.12
Tooele.....	68,029.195	732,279.97
Utah.....	250.000	200.00
Washington.....	520.000	15,752.64
Impossible to classify.....	8,593.472	1,834,834.79
Totals.....	237,233.844	19,571,766.99

As to sources the output was:

	Gold.	Silver.
	Fine Ounces.	Fine Ounces.
In quartz and dry ores.....	11,037.230	976,692.04
In cyanide mill bullion.....	99,036.355	80,709.92
In lead ores.....	35,048.941	11,258,323.91
In copper ores.....	80,190.617	6,271,815.55
In milling ores.....	11,080.701	984,231.34
Totals.....	237,233.844	19,571,766.99

The larger gold output is traceable to the expansion of mining operations in Bingham district, Salt Lake county, where a rapidly growing copper production includes a proportionate increase in gold and silver extracted from ores in which they are associated with copper. The Tintic (Juab county) and Park City (Summit county) districts, by increased values of these metals contained in the lead ores from their mines, have also contributed to the advance in production of these metals and the steady output recovered by the cyanide process continues.

The copper and lead output of the State was by counties:

	Copper.	Lead.
	Fine Pounds.	Fine Pounds.
Beaver.....	732,085	6,005,694
Juab.....	8,214,216	16,492,984
Salt Lake.....	16,689,132	3,680,976
Summit.....	3,797,101	79,453,945
Tooele.....	1,658,208	3,391,234
Utah.....	1,811,626	100,000
Washington.....	650,324	1,100,424
Custom smelters in addition to the above not possible to distribute by counties.....		
Totals.....	33,552,692	109,765,257

### Beaver County.

The Horn Silver mine of Frisco is maintaining a steady output of ore carrying values in copper, silver and lead. The copper ore shipped is said to average 25% copper. Considerable development has been done in the mine recently and satisfactory disclosures made.

### Grand County.

The pump with which the gold-bearing bars of the Big Six M. Co. at Dewey, on the Grand river, have been equipped, is raising 2000 gallons of water per minute from that stream, and with this washing the gold out of 500 cubic yards of gravel daily, says Manager Cato. While the equipment thus far is but a unit in that which is projected, the future of the Grand river placers will be influenced largely by results with which the initial plant shall be operated. While it has required some time to set it up, the plant thus far consisting of a 30 H. P. engine and pump, has been inexpensive, the entire cost being \$4100. For 80 miles along its course the stream is said to have been profitably panned.

### Salt Lake County.

It is reported the copper plant on the Jordan river, near Salt Lake City, is reported sold to the Utah Fuel Co., for \$100,000. With the plant, which has been idle for twelve years, is included ninety-four acres of surrounding land. It is said the structure will be used as steel works.

R. Rodgers, general superintendent of the Bingham Con.'s system of Bingham mines, says the main tunnel in the Dalton and Lark group is going ahead on the strike of the Miners Dream ledge, the tunnel having penetrated the zone for 6500 feet with 1700 gallons of water per minute issuing from its mouth. The Dalton and Lark shaft is also dropping down

again with the next level to be established at 1200 feet. From the Dalton and Lark and Commercial groups Superintendent Rodgers is forwarding 250 tons daily, with this to be increased.

T. R. Jones of the ore purchasing department of the United States S. Co. at Salt Lake City says his company will enter the market for lead ores August 1. Jones has been making contracts with producers for some time past. While the new lead plant is not yet ready to go into commission, it is the intention of the United States Co. to get a good supply of ore on hand before the plant is blown in, which will be in September.

It is stated that H. M. Crowther, manager of the Continental-Alta mines at Alta, has a lease on the tramway between that camp and the outlet into the valley, and that under him its repair and re-equipment will begin this month. The Continental-Alta Co.'s mines have a large volume of ore awaiting an outlet such as the tramway may be made to provide. There are heavy tonnages awaiting its reopening in other properties.

Over the tracks of the Copper Belt railway in Bingham section, there is being moved daily with the mills and smelters as its destination 1500 tons of ore and yet patrons on the route are calling for more rolling stock, says Superintendent Van Housen. The principal customers are the Boston Con., the Commercial, the Utah Copper, the Yampa and Ohio, with others of smaller output, while the up-freight to the United States company's properties and others on the route is large.

### Summit County.

Negotiations for the consolidation of the Comstock and California mining companies at Park City are said to be pending. The apex question has come up between the two companies and if they do not consolidate there is said to be possibility of a lawsuit.

The new pumps and machinery on the Silver King Con., at Park City, have been put in operation, and as soon as the water in the mine is lowered sufficiently, operations on a larger scale will be started underground. The shaft, which is down 700 feet, will be sunk to the 1000-foot level.

### Utah County.

F. B. Many of Cleveland, O., part owner of the Dutchman mines, in American Fork canyon, near American Fork, says they propose to equip the group with a mill this season. During the past year the management has done 600 feet of tunneling and built a sawmill. W. J. Holden, vice-president of the company, is in charge at the camp.

## WASHINGTON.

### Chelan County.

The Larica gold mine at Blewett is reported working seventy-five men and milling 140 tons of ore a day. J. D. McIntyre is manager. The mine is equipped with a 20-stamp mill, cyanide plant and an aerial tram. It is said to be the intention of the company to add twenty more stamps to the mill.

### Okanogan County.

The Oversight mine, near Chesaw, has been bonded to Superintendent H. Thompson of the Interstate Co. and others. One payment has been made. Work will be increased. The Oversight is on Copper mountain. A shaft has been started near the center of the area.

### Stevens County.

J. Wolff reports a strike on the Ruby group, one-half mile northeast of the Cleveland mine, 18 miles northwest from Springdale. Chloride of silver was found in an incline on the ledge. The Ruby group comprises three claims, and is owned by S. Emerson, J. Wolff, M. C. McGrogh and J. McMinis. Two shifts are sinking an incline which is 50 feet deep. The vein is a contact, between diorite and lime. The ore is gold, copper and silver. A strike of a 3-foot ledge of gold ore is reported made on the Muldoon mine, 3 miles from Marcus.—A 4-foot ledge of gold ore has been opened up on the McMillan mine, near the Muldoon, said to run one ounce in gold per ton. D. Clark of Spokane has a bond on it and is working two shifts. Eastern men are said to be negotiating for the Big Bear property in same district, owned by Portland, Or., people.

## WYOMING.

### Crook County.

It is reported the operators in the oil fields of Wyoming have been given a decision by the Commissioner of the General Land Office at Washington, holding that they can enter on the sections in each township set apart for school purposes—sixteen and thirty-six. The school sections near Moorcroft have accordingly been entered, and on some of them prospecting is under way.

## FOREIGN.

### BRITISH COLUMBIA.

#### Boundary District.

The British Columbia C. Co. of Tate has been doing diamond drilling at the company's Mother Lode group of mines in Deadwood camp. A body of iron ore was found in the Primrose claim, one of the group, and holes are being put down from the 300-foot level of the Mother Lode mine.—Work has been discontinued at the Breyfogle mine, in Summit camp, one of a number of iron claims, on which work had been done for some weeks past. On an adjoining claim, the No. 37, under bond to the Granby smelter interests, development and shipping continues with favorable results.—P. J. Dermody of Phoenix will develop his mining interests up the west fork of Kettle river.

At the Providence mine, near Greenwood, preparations are being made to put in a complete electric equipment, by Manager D. McIntosh. It is said the Elkhorn, adjoining the Providence, and owned by P. McDonald and J. Sutherland, will also install an electrical equipment. Power will be taken from the Cascade power lines.—The Great Northern graders have opened up bodies of ore on a number of claims near Phoenix, thereby assisting in the development of the properties, as well as affording convenient transportation as soon as the railway line is completed and the properties are ready to ship.

Electrical energy is being utilized as motive power at the British Columbia C. Co.'s Mother Lode smelter at Greenwood. The power is used to operate the blowers for the two blast furnaces. The Cascade W. P. & L. Co., Ltd., built a pole line from the Phoenix substation to the smelter, 5 miles, to supply the necessary 800 H. P. The entire works, including the newly installed two stands of converters, will use electrical power. The 50% copper matte will have the waste blown out by the converters till it is 98% pure, containing only copper, gold and silver values. The refining will be done in the East. Till recently the matte was sent to the Tacoma smelter for converting. The converter will run but one shift until new furnaces are added. It is also said plans are under way for extension of the electrical line to the Mother Lode mine, 3 miles west of Greenwood, where steam power is being used to operate the drills, hoists, pumps and ore crushers. It is also said that as the electrical power can be delivered at one-third or one-quarter the cost of steam power the Boundary Falls smelters will some time this year arrange for using it, as it is but 3 or 4 miles down Boundary creek from Greenwood.

#### Cariboo District.

Johnson & Fry have found a deposit of scheelite in the Willow creek region of Cariboo, says the Journal of Ashcroft.

#### Nelson District.

Near Ymir the Drummer group, at the head of Hall creek, is starting operations. J. A. Turner of Nelson is interested.—There are seven mines steadily producing in Ymir district, being the Ymir, Wilcox, Hunter V., Fern, Queen, Arlington and Second Relief.

It is reported that the Leo G. M. & M. Co., which owns seven crown-granted claims on Hall creek, near Ymir, will start systematic development this year. A. J. McMillan of Rossland is president of the company.—Peterson Bros. have started work on their placer lease on the Salmon river. They have ½ mile of the river, starting 2 miles above Porto Rico siding. They are putting in flumes and sluice boxes.

The Ymir mine at Ymir is reported producing at the rate of \$16,000 a month. Last month the forty stamps ran twenty-nine days and 2950 tons of ore were crushed, producing 789 ounces of bullion. The estimated realizable value of the product is \$8450. Two hundred and twenty tons of concentrates were shipped, of a gross value of \$6250. The cyanide plant treated 2900 tons of tailings, producing bullion valued at \$1100. The sundry revenue made the total receipts of the Ymir mine for the month \$16,700. Working expenses were \$15,000. There was expended on development during the month \$1690.

#### Rossland District.

At the Cliff mine, at Rossland, Superintendent Angus has men at work on the No. 1 glory hole, from which initial shipments of ore will be quarried. It is near the north end of the claim, and the vein is 11 feet in width. The second glory hole is being opened lower down on the vein.

Sixty men will be added to the War Eagle-Centre Star working number at Rossland when the extraction of milling ore reaches its maximum. Continuous shipments of second-class ore at full capacity will begin August 1. The ore is

already being stopped. The combined mines are employing 220 men. Six to eight machine drills will be required on milling ore. The complement for six machines is twenty-four miners and as many more laborers. At least a dozen extra men will be employed about the mine and surface in the handling of second-class ore. Milling ore will be extracted largely from the upper stopes in both mines.

The machinery is being set up, says F. Demuth, superintendent of the White Bear Co. at Rossland, referring to the work in the concentrator. Twenty stamps are in place, and ten more are on the way. It is expected to have the concentrator running in August. The 350 H. P. electric motor is set up, and the wires are being connected. When the mill nears completion they will start unwatering the mine.

F. Dietzsch, consulting engineer of the Giant M. Co., near Rossland, says plans are formed for rehabilitating the company and increasing development. Reduction works may come later, depending upon the results of development. Dietzsch will make tests in magnetic separation as applied to Rossland ores.

Seven hundred and fifty miners' inches of water on Sheep creek, near Rossland, has been taken up by the Le Roi M. Co. for concentration purposes, says Manager J. H. Mackenzie. He asks permission to divert the water specified at a point 1/2 mile below Silica, on Little Sheep creek, returning it at or near Sheep Creek station, or Patterson. The difference in altitude is 250 feet and a flume and dam will be used. The notice states that the land on which the water will be used is that on which a concentrator will be built.

#### Slocan District.

Slocan ore shipments for the first six months of 1904 are in excess of same period last year by 1000 tons silver-lead and 300 of zinc, says the Rossland Miner. Further increase is expected in Sandoz camp. The total amount of ore shipped from the Slocan and Slocan City mining divisions for the year 1903 was 15,200 tons. Since January 1 to June 25, 1904, the shipments have been as follows:

	Tons.
Alamo	290
Blue Bird	43
Black Prince	43
Charleston	60
Chapleau	43
Cinderella-Medford	175
Comstock	200
Enterprise	340
Fisher Maiden	30
Hamlet	390
Idaho	100
Ivanhoe	1,305
Last Chance	216
Lorna Doone	40
Ottawa	241
Payne	1,273
Rambler	480
Red Fox	61
Reco	577
Ruth	255
Slocan Star	746
Sovereign	41
Sunset	288
Wakenfield	80
Fifteen others	216
Total tons	7,563

Seventy men are at work at the Slocan Star mine, at Sandoz, says B. N. White, of Spokane, Wash., manager. The mine is shipping 500 tons of silver and lead ore and 600 tons of concentrates to the smelter each month. The ore assays 96 ounces in silver and 55% lead.

The Rockland group of three copper claims, 4 miles south of Silverton, has been sold to Eastern men, W. W. Spinks of Vernon, B. C., and F. Watson of Spokane, Wash., retaining an interest. They have put eighteen men to work and it is intended to increase development during this summer, and next spring decide on a reduction plant. A tunnel to crosscut the ledge at a depth of 300 feet will be started. A compressor will be put in. The mill is 2 1/2 miles from the Canadian Pacific railway.

#### Yale District.

Copper prospects are reported near Ashcroft on the main line of the Canadian Pacific Railroad, out from Vancouver. J. D. Sword says the largest exposures of ore are on the Transvaal group, which consists of several claims. The Transvaal group is under bond to S. Curtis of Rossland and J. D. Sword and considerable development work will be done. From the nature of the ore a large amount will be smelted direct, the balance being concentrated. Power will be obtained from Eight Mile creek and transmitted electrically to the mine. The ore carries azurite and malachite. The coal fields of the Nicola valley, which are 40 miles distant, and to which railway construction will find no engineering difficulties. South of the copper district are deposits of iron which carry small percentages of copper and which will be valuable as fluxes for the Highland valley ores.

American capital is reported interested in the cinnabar mine on Hardie mountain, near Savonas, on the main line of the Canadian Pacific railroad. Men have been sent there to develop the claims,

R. G. Tatlow of Vancouver is interested. Coal Hill camp, in Kamloops district, about 250 miles from Vancouver, on the main line of the Canadian Pacific railway, is being opened up.—F. Lunderwood and W. E. Thomas of New York, of the British Columbia C. Co., operating at Greenwood in the Boundary district, say the self-fluxing character of the gold-copper ore in the Kamloops will make it valuable for smelting. They are interested in Coal Hill and in Cherry Creek, close by. They are negotiating for the Copper King mine there.

#### MEXICO.

##### Ohhuahua.

D. J. Knotts has machinery for a 5-stamp mill being put on his mine at Santa Ramona, 65 miles from Mesa de Sandia, the terminus of the Parral & Durango Railroad. A cyanide plant will also be built. Santa Ramona district is on the road to Guadalupe y Calvo. Knotts says the veins carry high-grade silver and gold values. It is too remote from transportation to make the refractory ores pay. He is sinking four shafts on his property.

##### Guerrero.

A concession has been granted by the Government to J. L. Requena to exploit lode mines and gold placers in the municipalities of Chilpancingo and Tlacotepec, in the Bravos district, and in the municipality of Atoyac, in Galeana district. The concession is for three years, and exploration work must start within six months from June 25, 1904.

##### Jalisco.

The Valenciana M. Co. of Guadalajara has been organized to take over several gold and silver properties in Navidad district. These properties aggregate sixty-four pertenencias. J. T. Jackson, at La Barca, and E. Schuh of Guadalajara are interested. The company will begin development work this week.

L. Navarro, for the Compania Petrolera Mexicana, will prospect for oil on the Rancho de las Candelas, bordering on Lake Chapala, near Sahuayo. Three drilling outfits will be put in operation.

Guadalajara reports say M. D. Watson et al. of Chicago, Ill., have organized a company to develop the Rosa Amarilla copper mines in Autlin district. It is intended to exploit also a timber tract of 2,000,000 acres and to build an electric railroad from the mines to the Pacific port of Navidad. The railroad is being surveyed. The electricity will be generated by a series of plants on the Cusapala and Santa Maria rivers where water power is obtainable.

##### Mexico.

At El Oro, the north tunnel of the Dos Estrellas mine is reported to have cut the vein.—At the Santiago Anexas group of mines bought by J. J. West, of Chicago, Ill., and other Eastern men, preparations are being made to increase the milling plant to, ultimately, 1000 tons daily. The present equipment has a capacity of sixty tons a day and is run by water power. The ore is said to carry \$5 per ton in gold, with silver values, occurring in a mass of small quartz veins in talcose slate, and it is said can be worked by open cuts. Electric power will be used for the enlarged milling plant.

##### Michoacan.

S. Hagelin of El Oro reports having made a cinnabar discovery in Michoacan, near the Mexican State line. Locations covering 142 pertenencias have been made.

##### Oaxaca.

At Penoles the Rosario y Anexas M. Co. proposes to build a 10-stamp mill. The company's property contains ninety claims on eight separate veins.

##### Sinaloa.

Mining activity has been renewed in Cosala district, says the Jalisco Times. In this district are the mines of the Guadalupe de los Reyes Co. At La Dura mine, owned by F. Aragon, considerable American machinery is to be set up, including a concentrating plant. In the San Antonio mine, owned by A. Zazueta and F. J. Loureiro, a vein of silver ore has been opened up which assays 600 ounces silver. At La Prieta mine, owned by Hernandez & Borbolla of Sinaloa, a large number of men are employed in development work. Near San Ignacio, south of Cosala, La Compania Minera del Chilar has started work on a gold and silver property.

##### Sonora.

At Los Coches Manager W. J. Burdick, of the Los Coches M. Co., is putting up a stamp mill and cyanide plant. The reduction plant will consist of ten stamps and twenty cyanide vats, the pulp going to the solutions from the stamps.

At the Ures Con. mine at Gabilan, 33 miles up the Sonora river, northeast of Hermosillo, the main shaft, down 320 feet, will be sunk to 500 feet. A pump with capacity of 250 gallons per minute is

handling the water. The water is utilized in the milling plant. The equipment includes a 10-stamp mill, with pan amalgamation. There is also a steam hoist with capacity for raising 100 tons of ore daily from 500 feet depth. The company also owns El Murcielago (The Bat) mine, 3 miles distant. S. B. Smith is superintendent.

The Gutierrez mine at La Barranca is reported developing high-grade silver ores. Recently a shipment of 400 tons to the Toledo reduction works yielded \$28,000 and netted \$12,000, gold. The shaft is 300 feet deep. A heavier hoist will be put in and the shaft continued to 600 feet. A plant to reduce ores by lixiviation process will be put in.

Chicago, Ill., and Western men have organized the Cieneguita C. Co. The company has acquired 20,000 acres and 1000 Mexican mining claims, some of which were superficially worked two centuries ago. Smelters are expected to be in operation in November. The company owns 6000 feet of tunnels. The general headquarters of the company are in Chicago, Ill. The president is G. Beebe of Cieneguita, Mexico, and vice-president G. A. Sanderson of Chicago. The directors include G. Beebe, G. A. Sanderson, G. M. Reynolds.

##### Vera Cruz.

S. Pearson & Son report striking a heavy flow of gas in a well being driven for oil near Jaltipan.

#### TASMANIA.

The Mount Lyell M. & R. Co. at Mount Lyell, from May 26 to June 22, inclusive, treated a total quantity of 27,147 tons of ore, being 19,827 tons from the Mount Lyell mine and 7320 tons from the North Mount Lyell mine. In addition there was treated 199 tons of purchased ore and metal-bearing fluxes. The converters produced during same period, 603 tons of blister copper, containing 595 tons copper, 59,166 ounces silver and 1671 ounces gold.

\*\*\*\*\*  
**Personal.**  
 \*\*\*\*\*

E. BABCOCK, a mine owner of Helena, Mont., is in the East.

G. H. EVANS has returned to Breckenridge, Colo., from Sumpter, Or.

C. J. BANDMANN of San Francisco, Cal., is examining gold mines in Wyoming.

T. J. HOUGHTON of Folsom, Cal., is in San Francisco, Cal., on mining business.

JOHN H. MACKENZIE of San Francisco, Cal., is at Le Roi mine, Rossland, B. C.

J. M. WALBRIDGE of Yreka, Cal., is in San Francisco, Cal., on mining business.

GEO. A. TWEEDY of Los Angeles, Cal., is examining property in Butte county, Cal.

T. B. JENNINGS has resigned as manager of the Guinea Fowl mine near Gwelo, Rhodesia.

MANAGER B. WILKINS of the Idaho-Maryland mine at Grass Valley, Cal., is in Boston, Mass.

CHAS. L. LANG of Sonora, Cal., is examining mining property at Mooretown, Butte county, Cal.

M. D. KELLY is superintendent of the Republican mine at Jacksonville, Tuolumne county, Cal.

D. M. WATTERS of Sumpter, Or., is superintendent of the Blue Bird mine and mill near Sumpter.

F. W. BRADLEY of San Francisco, Cal., has gone to Alaska to visit the properties under his direction.

R. STUART BROWNE of San Francisco, Cal., has gone to northern California on professional business.

J. W. WINKFIELD is superintendent of the Sydney group of mines, near Rico, Dolores county, Colo.

T. J. BULGER of San Francisco, Cal., has returned from making mine examinations in San Salvador, C. A.

W. F. DETERT of Jackson, Cal., president and manager of the Argonaut M. Co., is in San Francisco, Cal.

S. SWANSON is general foreman of the Granby copper mines at Phoenix, B. C., vice P. J. Dermody, resigned.

L. H. CARVER, manager of the Mountain mine near Sierra City, Cal., is at the mine from San Francisco, Cal.

W. A. PRICHARD left Kalgoolie, W. A., May 30 for London, and will visit California before returning to Australia.

G. V. NORTHEY of Sulphur Creek, Colusa county, Cal., interested in quick-silver mines, is in San Francisco, Cal.

W. J. SHARWOOD has been appointed assistant professor of chemistry at the University of California, Berkeley, Cal.

A. K. GRIM, president of the El Dorado C. M. Co., is at Georgetown, Cal., from Berkeley, Cal., visiting the company's mines.

W. W. TRIMPIE, Newark, N. J., has returned there from Breckenridge, Colo., where he has been looking after mining interests.

A. M. McDONALD, recently with the California Debris Commission, is superintendent of the Ida Mitchell mine, at Placerville, Cal.

F. HARRIS has severed his connection with the Rand Drill Co., of which he was formerly sales agent in Butte, Mont., and Salt Lake City, Utah.

P. J. DERMODY, for six years general foreman at the Granby copper mines at Phoenix, B. C., has resigned to look after mining interests on Kettle river.

E. A. KING of Chicago, Ill., is manager of the Tonopah-Belcher M. Co. and has taken personal supervision of the company's mines, near Tonopah, Nev.

SUPERINTENDENT ENGLISH of the Mount Jefferson mines at Groveland, Cal., has returned there after an absence of several weeks in the northern part of the State.

J. M. CALLOW of Salt Lake City, Utah, mechanical and consulting engineer for the Montana Ore Purchasing Co. of Butte, Mont., is in Butte installing mill equipment.

C. B. LAKENAN has resigned as superintendent of the Turner mines in Mohave county, Ariz., near Needles, Cal., and has gone to Grass Valley, Cal., to accept the superintendency of the Idaho-Maryland mine.

W. F. WARDEN, president and general manager of the Burt Manufacturing Co. of Akron, Ohio, has returned from an extended business and pleasure trip through Europe. While in London, Mr. Warden secured an order from his British agents for 150 oil filters and exhaust heads, which, he says, is the largest single order for goods of this kind that has ever been given.

FREDERICK A. C. PERRINE, PH. D., first vice-president of the Stanley Electric Manufacturing Co. of Pittsfield, Mass., has resigned his position, which carried a large salary, to devote his attention exclusively to private practice as a consulting electric engineer. Dr. Perrine was formerly professor of electrical engineering at Stanford University, Palo Alto, Cal., and consulting engineer to the Standard Electric Co. of California.

\*\*\*\*\*  
**Obituary.**  
 \*\*\*\*\*

T. C. BORLAND, a mine owner of Keeler, Inyo county, Cal., died at Keeler on the 3d inst.

J. P. WOODHAVE, a pioneer mining man of Colorado and Wyoming, died at Denver, Colo., on the 9th inst. Deceased was 65 years of age.

WILLIAM JACK of Los Angeles, a pioneer mine owner of Idaho and Montana, died at Grangeville, Idaho, on the 18th inst.

ISAAC ROBERTS, the astronomer and geologist, died at Crowborough, England, on the 18th inst., aged 75 years. Nine years ago deceased was given the gold medal of the Royal Astronomical Society. Since 1890 he had continued his scientific work at Starfield, and had been a frequent contributor to scientific journals.

\*\*\*\*\*  
**Commercial Paragraphs.**  
 \*\*\*\*\*

THE Mineral Products Co. have moved from Philadelphia and are now located in their new and specially equipped building at C and Buttonwood streets, Wilmington, Del.

THE Brown-Corliss Engine Co., of Corliss, Wis., have opened a department for building high-speed engines, and are now working on two units of 150 H. P., three 250 H. P., two 50 H. P. and one 75 H. P., all to be direct connected.

ARTHUR KOPPEL, manufacturer of industrial, narrow and standard gauge railway materials, of 66-68 Broad Street, New York, has an exhibition of track switches, turntables, cars of various styles, etc. His exhibit will be found in the Building of Mining and Metallurgy,

block 20, assignment 10, and visitors will receive a cordial welcome.

THE Columbus Machine Co. of Columbus, O., have opened an office in Cincinnati, O., at No. 227 West Fifth Street, where they will carry a stock of engines. The office will be in charge of Mr. Van Dusen, who will have engines in operation to show the merits of the Columbus.

## Latest Market Reports.

SAN FRANCISCO, July 22, 1904.

### METALS.

**SILVER.**—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58½c, refined (1000 fine); San Francisco, 58½c; Mexican dollars, 47½c San Francisco, 45½c New York.

**COPPER.**—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$13.00; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £57 11s 3d spot per ton.

Copper remains practically unchanged, an advance of a fraction of a cent being observed within the week. Still the demand for the metal is good. The strike at one of the Lake mines has not spread as yet, and its effect is not noticeable. The strike of pilots on the Lake steamers having failed, the influence on the market may be to increase shipments during the remainder of the open season, which may have the effect of bringing about somewhat lower prices.

Following are the figures of the German consumption of foreign copper for the months January—May, 1904, compared with the same period of time in 1903-1902:

	1904.	1903.	1902.
Imports, tons.....	47,231	36,223	33,971
Exports, ".....	3,239	4,739	3,748

Consumption.....43,992 31,484 30,223

**LEAD.**—New York, \$4.35; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots, 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 13s 9d long ton.

**SPELTHER.**—New York, \$4.85; St. Louis, \$4.75; London, £22 ½ ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

**TIN.**—New York, pig, \$26.30 @ 26.50; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, ½ lb., 30 @ 32½. London, £120 spot.

**PLATINUM.**—San Francisco, crude, \$18.50 ½ oz.; New York, ingot, \$19.00 ½ Troy oz. Platinum ware, 75 @ 82c ½ gram.

**QUICKSILVER.**—New York, \$44.50 @ 45.50, large lots; London, £8 San Francisco, local, \$43 @ 43.50 ½ flask of 75 lbs.; Denver, \$46.00. Export, \$43.00 @ 43.50.

**BABBITT METAL.**—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

**SOLDER.**—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

**ZINC.**—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

**NICKEL.**—New York, 40 @ 47c ½ lb.; ton lots, 40 @ 47c.

**ALUMINUM.**—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31 @ 34c.

### STRUCTURAL MATERIALS.

**IRON.**—Pittsburg, Bessemer pig, \$12.60 @ 12.85; gray forge, \$12.00; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

**STEEL.**—Bessemer billets, Pittsburgh, \$23.00 @ 23.00; open hearth billets, \$23.00 @ 23.00; San Francisco, bar, 7c to 12c ½ lb.

**NAILS.**—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.45; Cut, \$3.55; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

**LIME.**—Santa Cruz, \$1.25 country, \$1.25 city ½ bbl.

**CEMENT.**—Imported, \$2.15 @ 2.65 ½ bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 ½ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

### GENERAL SUPPLIES.

**ANTIMONY.**—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300 @ 500-lb., 8½c; 100-lb. lots, 10½c.

**POWDER.**—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1½, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1½ 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2½ 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

**CAPS.**—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

**FUSE.**—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

**CANDLES.**—Granite 6s, 16 oz., 40s., 11½c ½ set; 14 oz., 40s., 10c.

**COAL.**—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.00; Southfield, \$5.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$11.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$11.50, long ton.

**CHEMICALS.**—Cyanide of potassium, 98%—99%, jobbing, 23 @ 24c ½ lb.; carloads, 23 @ 23½c; in tins, 30c; soda ash, \$2.00 ½ 100 lbs.; hyposulphite of soda, 3 @ 3½c per lb.; caustic soda, in drums, 3 @ 3½c ½ lb.; Cal. s. soda, bbls., \$1.20 @ 1.40 ½ 100 lbs.; sks., \$1.05; chlorate of potash, 12 @ 13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½ @ 2½c; powdered sulphur, 2 @ 3c; flour sulphur, French, 3½ @ 3½c; alum, \$2.00 @ 2.25; California refined, 1½ @ 2c; sulphide of iron, 8c ½ lb.; copper sulphate, 5½ @ 5½c; chloride of lime, spot, \$2.50 @ 2.75; sulphuric acid, in carboys, 66% B, 1½ @ 2c ½ lb.; nitric acid, carboys, 8c ½ lb.

**OILS.**—Linseed, boiled, bbl., 54c; cs., 59c; raw, bbl., 54c; cs., 52c; Lucol oil boiled, bbl., 48c; cs., 53c; raw, bbl., 46c; cs., 48c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 88° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 68c; Sperm, crude, 63 @ 68c; Natural White, 70c; Bleached, do., 80c; Whale Oil, cs., 52 @ 57c.

**BONE ASH.**—Extra No. 1, 5 @ 6c ½ lb. No. 1, 4 @ 5c.

**RED LEAD.**—500 lbs. and over at one purchase, ¾ lb., 7c; less than 500 lbs., 7½c.

**LITHARGE.**—Pure, in 25-lb. bags, 8 @ 9c ½ lb.

**BORAX.**—Concentrated, 6 @ 7c ½ lb.; powdered, 8 @ 10c; fused, 20 @ 25c; crystal, 7c; calcined, 25c.

**MOLYBDENUM.**—Best, \$2.00 ½ lb.

**CHROMIUM.**—90% and over, ½ lb., 80c.

**PHOSPHORUS.**—American, ½ lb., 70c.

**SILVER.**—Chloride, ½ oz., 90c @ \$1.00; nitrate, 55c.

**MERCURY.**—Bichloride, ½ lb., 77c.

**MAGNESIUM.**—Pure, N. Y., 60c.

**MANGANESE.**—½ lb., \$2.75.

**SODIUM.**—Metal, ½ lb., 50c.

**BISMUTH.**—Subnitrate, ½ lb., \$2.10.

**ALUMINUM.**—No. 1, 99%, small lots, 37c ½ lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburgh. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburgh.

**URANIUM.**—Oxide, ½ lb., \$3.50. (These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING JULY 12, 1904.

- 764,971.—LEATHER DRESSING—A. Aagaard, Everett, Wash.  
764,701.—BOOK LEAF—H. W. Ayers, Los Angeles, Cal.  
764,836.—ELECTRIC SWITCH—W. J. Bell, Los Angeles, Cal.  
764,708.—OIL BURNER—I. Carl, Los Angeles, Cal.  
764,709.—RESPIRATORY APPARATUS—Chapin & Sherman, Berkeley, Cal.  
764,560.—SHINGLE MACHINE—F. A. Cloudy, Startup, Wash.  
764,714.—SAFETY HOLDER—Mary A. Davis, Los Angeles, Cal.  
765,071.—GAS GENERATOR—Eichler & Becker, S. F.  
764,567.—ENDLESS CHAIN SICKLE—H. S. Ekel, Stockton, Cal.  
765,074.—LEMON SQUEEZER—W. H. Gregory, Vallejo, Cal.  
765,014.—SKIRT PIN—Mary E. Kintz, Tacoma, Wash.  
765,084.—DENTAL MATRIX—S. E. Knowles, S. F.  
764,739.—CARPET RENOVATOR—W. H. Loomis, Alameda, Cal.  
764,866.—ELECTRIC RAILWAY—T. Mahoney, S. F.  
764,858.—SAW SET—J. S. Mason, Santa Ana, Cal.  
765,027.—OIL BURNER—R. Matheson, San Diego, Cal.  
764,751.—GARMENT HOLDER—T. J. Murphy, Needles, Cal.  
764,674.—ELECTRIC HEATER—L. B. Pemberton, Redondo, Cal.  
764,624.—BORING MACHINE—Pfuger & Christensen, Portland, Or.  
764,557.—PENDULUM POWER—A. T. Prather, Douglas, Ariz.  
764,938.—PROPELLER—J. W. Raine, Seattle, Wash.  
764,865.—FOLDING TRESTLE—W. G. Read, Davisville, Cal.  
764,866.—FOLDING TRESTLE—W. G. Read, Davisville, Cal.  
764,959.—BOTTLE—G. G. Ross, Hazel, Wash.  
764,970.—ROTARY AGITATOR—J. Smith, S. F.  
765,155.—CAN OPENER—H. W. Thurlow, S. F.  
764,646.—AUTOMOBILE—C. W. Van Winkle, S. F.  
765,117.—BOTTLE—P. J. Wilson, Ben Lomond, Cal.  
764,654.—BOX—A. W. Wright, Pomona, Cal.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**FOLDING EXTENSION TRESTLE.**—No. 764,866. July 12, 1904. W. G. Read, Davisville, Cal. This invention relates to an apparatus which is designed for the use of carpenters, painters, plasterers, paper-hangers and the like. It consists in the combination of supports, separate legs, braces and attachments and means for dismembering and folding the apparatus into small compass, so that it can be taken through small doorways and spaces and afterward reassembled and extended to any required size.

**FOLDING EXTENSION TRESTLE.**—No. 764,865. July 12, 1904. W. G. Read, Davisville, Cal. This invention relates to a device which is especially designed for the use of carpenters, painters, plasterers, paper-hangers, and the like; and it consists in the combination of supports, separate legs, braces and attachments whereby the apparatus may be dismounted for the purpose of taking it through doorways or narrow places into rooms where it is to be used and afterward assembled and extended to any desired or required size.

**ELECTRIC RAILWAY.**—No. 764,856. July 12, 1904. T. Mahoney, San Francisco, Cal. This invention relates to improvements in electric railway systems of the third-rail type. The object of this invention is to devise a switch-box and operating means therefor carried by the car which shall be simple, cheap to construct, install and maintain, which requires a minimum amount of power to operate, and which will permit cars to travel at a high rate of speed.

**THE CALIFORNIA DEBRIS COMMISSION** having received applications to mine by hydraulic process from E. A. Moody, in Good Luck Mine, near Gold Run, Placer County, Cal., draining into Squires Creek, which reaches Bear River, and from Eagle Bar Placer Mining Co., Limited, in Eagle Bar Placer Mine, near Forest Hill, Placer County, Cal., draining into Middle Fork of American River, gives notice that meeting will be held at Room 96 Flood Building, San Francisco, Cal., Aug. 1, 1904, at 1:30 P. M.

**THE CALIFORNIA DEBRIS COMMISSION** having received application to mine by hydraulic process from W. J. Berry, Theodore Rupley and Bruce Graham, in Sugar Pine Mine, near Pino Grande, El Dorado County, Cal., draining into Silver Creek which reaches American River, gives notice that meeting will be held at Room 96 Flood Building, San Francisco, Cal., Aug. 8, 1904, at 1:30 P. M.

## Protect Yourself

If the employer thinks things aren't running right in the engine room, the engineer is pretty apt to get the blame unless he can prove that it is the engine at fault and not himself. This is easily done if you have a

**Robertson-Thompson Improved Indicator.**

It will tell exactly the conditions existing in the cylinder, and its readings are indisputable. The low price of this high-grade instrument will surprise you.

Write for our free catalogue.

**JAS. L. ROBERTSON & SONS,**  
Eureka Packing, Hine Eliminators, Etc. 204 Fulton St., New York

**ALL RUBBER GOODS MAY BE TREATED AGAINST DECAY**  
BY THE  
**RUBBER VITALIZING CO.,**  
Phone Ex. 216. 121½ Geary St., San Francisco, Cal.

## SITUATIONS WANTED.

**EXPERIENCED ASSAYER DESIRES POSITION** with mining and milling company. Thoroughly competent in bullion, control and analytical work. Best of references. Address "Bullion," care of this office.

**EXPERT MINE FOREMAN WANTS POSITION.** Competent to handle extra difficult conditions underground. Address "Limestone," Room 602, 330 Market St., S. F.

**MANAGER OR SUPERINTENDENT FOR A** gold, silver or copper property; 20 years' experience in different parts of the country. All reference. Can furnish any bond. Mexico preferred. Address D, this office.

**MILLMAN WANTS SITUATION. GOOD REFERENCES.** Concentration, amalgamation, cyaniding and assaying. Can handle men and machinery. Address "Millman," 1656 South Gaylord St., Denver, Colo.

**POSITION DESIRED AS SUPERINTENDENT** to develop or operate mine and small mill; will do own assay work; would accept part salary in stock; experienced all round man; excellent references. Address "Dividend," care of this office.

**WANTED, POSITION AS SUPERINTENDENT** of mine and mill; amalgamation and concentration; competent assayer and analyst; good references. Address "Vanner," care of this office.

## HELP WANTED.

**WANTED—ELECTRICAL ENGINEER AND** Mechanic for a Western mining company, to take charge of a small electric-water power plant, A. C. generator, electric mine locomotive, air compressor, lights, etc. Must have extended experience with electric street-car motors, generators, electric locomotive. Able to set up, repair and run same. Give information and references as to experience, character and ability. A good opening for a young married man with a strong company. Address "Kootenay," care of Mining and Scientific Press.

### 4 P's.

Do you know that throwing away waste oil is throwing away money? Do you know the **CROSS OIL FILTER** is guaranteed to save 1/2 of the cost of oil?

Do you know we send the **CROSS OIL FILTER** on thirty days' trial, and if it proves unsatisfactory you may return it at our expense?

Knowing these things, why do YOU delay ordering the **CROSS OIL FILTER**? "The Cross Oil Filter does as you claim for it." — Hamilton (Ohio) Otto Coke Co.

**THE BURT MFG. CO.,**

Largest Mfrs. Oil Filters in the World,  
221 Main St., Akron, Ohio, U. S. A.  
Supplied also by Oil Companies, Engine Builders and Power Contractors.

## The "Triplex"

Chain Block pleases man and manager. It lifts a big load with an easy pull, and is a money saver from first to last.

**Yale & Towne,**  
New York.

## The Importance of Geological Knowledge.

Many practical miners underestimate the value of a knowledge of geology. They conceive that geology requires an intimate acquaintance with the origin of

when veins and ore shoots are interrupted by faults. There are numerous cases of record where a superintendent lost his vein and gave up the search after expending large sums of

Interior of California Gold Mill at St. Louis Exposition.—(See Page 69.)

California Quartz Mill at St. Louis Exposition.—(See Page 69.)

the earth, and also, as well, of all of the numerous geological horizons from Archæan to Recent, etc., and that he must be able to tell at sight whether a formation belongs to this or to that period or age. It is true to be a thorough geologist requires a knowledge of all of these things, but the miner may acquire a knowledge of structural and dynamic geology as referred to ore deposits, and such knowledge will prove of great service many times. It often deters him from doing development which would be useless, and it as often indicates what should be done

money fruitlessly, leaving the rediscovery of the faulted vein to his successor, whose knowledge of geology gave him the needed advantage. In one instance a valuable vein which was being worked came upon a fault, cutting the vein at a small angle. The superintendent followed the fault, in the belief that he was still on the vein, though without ore. After running several hundred feet without finding ore the mine was shut down, but later, being reopened, another superintendent, on examining the disturbance where the ore abruptly ended, correctly

analyzed the situation, drove a crosscut in the hanging and in a short distance encountered the continuation of the vein. In another instance, also the case of a faulted vein, the fault was plainly exposed on the surface, but the superintendent—a good practical miner, who could do anything to be done about a mine, and who thoroughly understood handling men—failing observation sufficient to appreciate the geological conditions perfectly apparent to even a novice, drove an expensive crosscut in the wrong direction and nearly bankrupted his company in his

strenuous effort to find the vein again. Finally he drove to the opposite side and in less than 15 feet was in good ore. Neither of these cases seem as bad as that of the superintendent—a man of over thirty years' practical experience—who mistook a nearly flat vein, about 2 feet in thickness, lying on the surface, for a monster outcrop over a hundred feet wide, and sunk a shaft several hundred feet in hard rock and then crosscut hundreds of feet more in the vain effort to develop the great deposit. He passed through the vein in his shaft where it was about 4 inches thick, but it was too insignificant to attract even passing attention from one who was expecting a vein 100 feet in width. In either of these instances had the miner even a small knowledge of geology the mistakes above cited would not have been made.

## Technical Schools and the Mining Industry.

It is only within comparatively recent years that mining schools have become numerous in the United States. Forty years ago the education of an American mining engineer was not considered finished until he had taken the course at the noted mining school of Freiberg, in Saxony, Germany. To-day comparatively few American students believe it essential to their success to take the course at Freiberg, although that is still an excellent school, and one which the engineer can lose nothing in attending. American methods and practice, however, have gradually diverged from the hard and fast lines of a few years ago, and it has been found advisable, owing to the great diversity of mineral deposits, and to variable economic conditions found in America, to make many changes in methods, both in mining and metallurgy, to secure the best economic results. America is essentially a mining country. There is not a State or Territory in the Union that has not its mines and quarries, or oil and gas wells, or other valuable mineral deposits, and it is due to this fact, and to the environment of many mining regions, together with the demands of manufactures upon these deposits, that new systems have been introduced. Ore deposits of a size and existing under physical and economic conditions unknown in Europe have been discovered, developed and exhausted in America, while the mines of Europe continue to produce year after year, as they have for decades, and in some instances for centuries, under the dilatory policy which directs the scope and character of mining operations there.

The conditions in America have resulted in educating men in such a manner as to enable them to cope with the newer and greater problems. Throughout the West—and the West has been made by the mines, not the mines by the West—innovations are as commonplace as the discovery of new districts or new mines, until they have ceased to create wonder, and sometimes even comment. Realizing the importance of educating the rising generation of engineers to the understanding of these broader physical and economic problems, excellent mining schools and colleges have been established in many Western States and Territories, and Eastern educational institutions have recently added mining engineering to their course of study, although there are in the East some of the oldest and best mining schools in America. In all of these schools there is an increasing demand for more of that which is practical in the course. The theories which are taught are all founded on the best practice, but the practice hand in hand with the theory is what is required to accomplish the best result. The peculiar conditions found in American mines and the methods, which are an outgrowth of the necessities of each case, have made American engineers the most versatile and successful in the world. One thing is pronounced in the American mining engineer—he is not afraid to take the initiative. If he thinks he has a scheme which will be an improvement over old-time methods, either in mining practice or in the reduction of ores, he is not afraid to try it; and it is this characteristic that has made the services of American engineers abroad in great demand. No unusual condition is so unique or difficult but that the American engineer will devise a way to get around it. He can always make the best of the situation, and can seemingly create what he needs if it is not at hand. His inventive genius is so often called into play that he looks upon no proposition with misgivings, and he usually succeeds if there is any merit in the enterprise under his direction. This is partly the result of the character of the instruction received in mining schools and partly the result afforded in greatly varied conditions in the mines of America.

### Mistakes Still Being Made.

It seems strange that with all the years of practical experience which the mining regions of the West afford, that the most glaring mistakes are still being made, almost daily, in the choice of the type of mill selected to do certain work; in the situation of the mill after such choice has been made; in the construction details after the site has been chosen, and in the arrangement of the transportation problem between mine and mill. The reason for these mistakes will

probably be found in the fact that the arrangement of these matters has been placed in the hands of incompetent persons. In considering transportation, men of this class put in "what they know will work"—usually a track on a grade and a series of chutes to reach the mill, when aerial tramway would be no more expensive, cheaper to operate, and more satisfactory in every way. Rock breakers are placed in the mill, when the proper place for them is at the mine. The mill is set in such a manner that ore is delivered at the rear in the middle instead of at one end; to be distributed where required. Mills are placed on flat ground when hillsides are available. Gravity is almost lost sight of in the unwise arrangement of some mills. It is still not an uncommon thing to find rock breakers elevated above the ore floor, so that every pound of ore must be raised a foot or more with a shovel. Some mills have no grizzlies, necessitating the passing of all the rock, both coarse and fine, through the breaker, thus multiplying the work of the crusher man and uselessly consuming power. Among the minor offenses of construction, if they may be termed such, are the failure to provide separate power wheels for concentrators, and often too few concentrators are provided. The mistakes being made in mill construction—mistakes, too, for which there is no reasonable excuse, are all the result of inexperience or lack of judgment.

### The Greatest Gold Mines.

The recent completion of an addition of 100 stamps to the Amicus mill of the Homestake Co. at Lead City, S. D., gives that company the largest combination of gravity-stamp batteries in the world—1000 heavy stamps—which crush every twenty-four hours upward of 4000 tons of ore, or about 1,400,000 tons annually. There are many mines, and good mines too, which have not sufficient ore in sight to keep these Homestake stamps in operation six months, but the Homestake ore is low grade—under \$4—and to make mining profitable under the existing conditions it is necessary to conduct operations on a scale attempted in but few places elsewhere. The first Homestake mill consisted of thirty-five light stamps and was built in 1876-77. In the summer of 1878 the first heavy mill, the Homestake of eighty stamps; was completed, and soon, thereafter, was commenced the construction of the second large mill, the Golden Star of 120 stamps, followed the next year by the Highland (now Amicus) mill, with 120 stamps. In the meantime the Father De Smet Co., 1 mile to the northward, built a mill of 100 stamps, the Deadwood Co. and the Golden Terra Co. each built 60-stamp mills, and the Caledonia Co. put in forty stamps (now Munroe mill), replacing their original 20-stamp mill. The Deadwood and Terra mines, adjoining at Terraville, were consolidated about 1880, and this property, with the 120 stamps, passed to the Homestake Co. later, as well as the Caledonia and Father De Smet.

All of these mills, excepting that at the De Smet, have been enlarged, some of them more than once, to keep pace with the expanding industry, until it has become the greatest gold mine in many respects on earth. Many mines are richer as to value of the ore they produce, but no others have the magnitude of the Homestake, nor are operations conducted on such a large scale.

The nearest competitor for magnitude of operations in a gold mine is found in the Alaska-Treadwell and Alaska-Mexican mines on Douglas Island, Alaska. The mining methods are somewhat dissimilar, but the general features of these great mines are about the same. The evolution of these mines from properties of small and incomplete development and equipment, as compared with their present magnitude, has been a constant study of changing conditions—physical, structural and metallurgical. Every advantage has been made use of. Automatic machinery has been introduced in every department. Gravity has aided greatly in the solution of the problem, and to-day cheaper mining is done nowhere under similar conditions than at the Homestake and the Alaska-Treadwell and Alaska-Mexican mines. The latter are operated at a somewhat lesser cost, owing to a rather more advantageous situation as to transportation; but, aside from this, these mines furnish examples of management and equipment which great mines throughout the world are endeavoring to profit by through their adoption.

THE great danger always present when working in a mine which is connected with another which is flooded was exemplified within the week by the breaking of a timber bulkhead in a Butte, Mont., mine, resulting in the flooding of the adjoining excavations and the drowning of several miners. The pressure of water on a watertight bulkhead is often greater than is supposed. In the case of a bulkhead 5 by 7 feet, sustaining a column of water 100 feet in height, the pressure would be 45 pounds on each square inch of surface of bulkhead, or a total pressure of over 226,000 pounds. This tremendous pressure furnishes an idea of the necessity of a construction made of the best materials, and so solidly anchored that it would be impossible for it to break away.

RECENT press dispatches state that the military have been recalled in Colorado and the maintenance of law and order has again devolved upon the civil authorities in the disturbed districts. The cost to the State for military protection during the past eighteen months is stated to have been about \$1,000,000. While this is a hardship upon the taxpayers of that State, there is no one well informed of the conditions which made military rule necessary but who believes that this sum is much smaller than the losses to mine owners and others would have been had not the military taken the reins and protected property. Even as it was, there was sufficient evidence of the lawless character of certain men to justify military rule. At such times the strikers and their sympathizers are wont to point to the fact that all is peaceful and quiet—when the place is under military restraint and the active agitators are being watched day and night, or possibly restrained of their liberty—and that the soldiers should be withdrawn. Experience has taught that those at the scene of the difficulties are the best judges of what steps are most essential to the preservation of peace. It is hopeful that the present peaceful conditions in Colorado will be maintained.

## CONCENTRATES.

TENORITE is a black oxide of copper and usually occurs in scales or in crystals, otherwise it is similar to melaconite, which is an earthy variety of the same mineral.

ANTIMONY has the effect of hardening lead, and this property is taken advantage of in the arts and manufactures. It is antimony that gives babbitt metal, type metal, etc., their requisite hardness.

OFTEN pyrite and marcasite are covered with a thin film of copper sulphide of brilliant peacock colors (bornite). This coloration is sometimes only a thin film and only denotes the presence of copper. Elsewhere in the vein copper ores may occur in larger amount.

THE bursting of dams is due to various causes, but the usual cause is an insufficient factor for safety. In some instances the shock of earthquake has weakened a dam of masonry or concrete, and collapse has resulted, but this is an unusual occurrence, particularly in the United States.

THE Homestake M. Co. at Lead, S. D., now has 1000 stamps dropping, crushing about 4000 tons of ore daily. This ore contains less than \$4 per ton on an average, but it is mined and milled at a good profit, owing to the magnitude of the ore bodies and the extensive scale of operations.

"CONCENTRATES" knows of no place where electric signals are operated in mines by means of electric currents passing along the track rails, but as signaling by this means is commonly practiced on the surface on railways, it is possible that this method of transmitting signals may be found feasible.

WHERE the filter in a chlorination barrel gave considerable trouble and required frequent renewal—in this instance cocoa matting—the matting was covered with a sheet of perforated lead, firmly secured to the interior of the barrel, and it was found that the filter would last for several months without renewal.

PURE GOLD has a tensile strength of seven tons per square inch. The admixture of some other elements with gold will destroy this wonderful tensile strength and ductility of gold. A very small admixture of bismuth—one part in 2000—renders gold so incoherent that it may be pulverized in the hand.

WHEN the water in a beaker glass, on being heated, shows a tendency to "bump" on reaching the boiling point, this "bumping" may be stopped by dropping into the beaker a small piece of clean glass. At once a large number of small steam bubbles will rise through the water, instead of a few large ones as before.

WHEN baryta (heavy spar) is transparent it is sometimes mistaken for calcite (calcium carbonate). The former crystallizes usually in flat, tabular crystals with edges having 90° angles; calcite crystallizes in rhombs. It also has the property of double refraction, which barite does not possess. The great difference in specific gravity also serves to distinguish them. Calcite effervesces with cold hydrochloric or nitric acid, and baryta does not.

IF concentrates are to be treated by the cyanide process it is better not to dry them, as in drying a greater or less amount of oxidation takes place with the formation of soluble sulphates which are detrimental to the operation of the process. At some works the sulphides are kept under water until they are charged into the vats for agitation or percolation, thus reducing the opportunity for the formation of the objectionable sulphates.

WHERE magnetite occurs in the surface outcrop of a copper-bearing gossan it is often observed pyrrhotite, the sub-sulphide of iron, is found, associated with the other sulphides of iron and copper. While pyrrhotite is often found thus accompanying copper ores, its occurrence cannot be considered a reliable index of the occurrence of payable copper ore, as the pyrrhotite is often found with little or no copper at all. All pyrrhotite deposits should be tested for nickel, as not infrequently it carries that metal in payable quantity.

WHITE skilled miners on the Rand are paid \$4 to \$5 per day. What wages are paid in the South American States and Republics is not known to "Concentrates," but generally the work is done by natives under white bosses. An American miner should make a contract with the mine management or owner before going into a foreign country. Men who go to South Africa, South America, or to other foreign lands without contract sometimes fail in their calculations and have to accept work, if they are so fortunate as to get it, at a lower figure than they had expected.

THE cause of frost about the exhaust of machine drills, pumps, engines and other devices run by compressed air is the freezing of moisture in the atmosphere, owing to the low temperature produced by the rapid expansion

of air from the exhaust, which always results when compressed air escapes. This is exemplified in an ordinary way in forcing air through the lips. The freezing of exhaust pipes may be prevented to some extent by making the exhaust apertures of good size, and in the case of pumps it is easy usually to arrange a small stream of water to fall upon the exhaust, which prevents the temperature falling below the freezing point.

THE Simplon tunnel now being driven through the Swiss Alps has encountered hot springs which have raised the temperature in the Swiss side of the tunnel to such a degree that further work is stated to be an impossibility, and it is possible the entire project may have to be abandoned, unless the distance still remaining unfinished (about 2600 feet), can be completed in the heading driven from the Italian side. The present rate of advance on this side is stated to be nearly 20 feet daily. The temperature of the springs and the atmosphere are not stated, but should these subterranean channels of hot water be struck on the south workings the tunnel will probably not be completed in many months.

THE percentage of quicksilver in ore varies greatly from 60% or over down to a fraction of 1%. Pure cinnabar contains 86.2% mercury. The statement has been officially made that in recent years the average contents of ores treated at New Almaden, Cal., has been 0.5% quicksilver. As the mines are continuously operated it is presumable that the operation has been carried on at a profit. The tonnage treated has been about 4000 tons of ore per month. That the average of metal in the ores of Spanish or Australian mines is much lower than that now being treated at New Almaden is improbable. Ore containing 3% to 12% quicksilver is rich, and conditions must be very bad where such ore would not pay a handsome profit.

ALUMINOTHERMICS is the name of a new science, based on the discovery that when oxygen and aluminum—the two most abundant elements known—are united in a proper manner, a temperature is created which is equal in intensity to that of the electric arc. This scientific principle is made use of in the arts. In it is employed, not the oxygen of the air, but oxygen as a solid in the form of some well known oxide, which is mixed with aluminum in the form of white powder. This material is known as "thermit." When ignited at one point the combustion extends to every other particle, creating an intense heat, which is now being utilized in many ways, but chiefly as a means of welding heavy pieces of rails, beams and machinery, such as shafts, etc.

GOLD may be precipitated from chlorine solutions by means of sulphurous anhydride (SO<sub>2</sub>). This process is employed at chlorination works at Angels, Cal., with success. Formerly, in the same works, ferrous sulphate solution was used for the purpose. The SO<sub>2</sub> is said to work as well and is more satisfactory. The gold is not permitted to settle in the vat into which the SO<sub>2</sub> is introduced, but the solution is agitated with compressed air, keeping the gold precipitate in suspension in the tank, from which it is drawn off and run through a filter consisting of several boxes filled with sawdust. When the filters are fully charged the sawdust is removed, dried and incinerated in a suitable retort and the resultant gold and ash smelted with suitable fluxes in a crucible.

THE statute permits a locator to take 1500 feet of unoccupied mineral land for each location made. This measurement is made horizontally along the outcrop or in its general direction, as determined by an outcrop extending a portion of the length of the claim. If the length of a claim were measured up the slope of a steep hillside, the locator would get considerably less than 1500 feet. A ledge or vein discovered in a tunnel may be located on the surface, in such manner that the apex shall be included where it should appear on the surface. If, however, the apex should be found later by another not to be within the claim as located, the original locator would lose his extralateral right. Therefore, it is better to discover the apex, if possible, by sinking shafts or by raising on the vein to the surface.

THE greatest geyser in the world is said to be that at Rotura, in New Zealand, where a geyser spouts from a boiling lake to a height of 900 to 1000 feet and over. The column consists of boiling water, steam, stones and mud. Its period of eruption is uncertain, but averages twenty-two times monthly. Within a year several tourists who approached too closely to the rim were overwhelmed by the eruption. The cause of the eruption of geysers is probably due to the formation of steam in the neck of the vent, beneath the water, which, on gathering sufficient force, violently ejects the water in a cloud of liquid, spray and steam. The greater the depth at which the steam is generated or finds a suitable chamber for collecting its force, the longer the interval and usually the more violent is the eruption. Why geysers become active when soap is thrown in the water is not known.

ALLOTROPIC minerals are those which present several varieties of physical appearance, while having the same chemical composition. Carbon exists in the form of the diamond as graphite, and as charcoal. Gold is stated by some to exist in allotropic forms, but these are of somewhat doubtful character. Gold exists in chemical combination with several other elements, in nature. Tellu-

rides and selenides of gold are examples. Ores of this character may contain higher values in gold, and still afford no indication of its existence by the ordinary methods of crushing and panning. Gold also forms combinations with oxygen, as aurous oxide (Au<sub>2</sub>O<sub>3</sub>) and auric oxide (Au<sub>2</sub>O<sub>3</sub>). A gold nugget which is much lighter than its size would indicate is probably of a spongy or cellular character, and would not properly be considered as an allotropic form of that metal.

COKE is usually employed all the time, or a portion of the time, in all of the so-called pyritic smelters of the United States, though where conditions are favorable "runs" are made of considerable length without the introduction to the furnace of other fuel than the sulphur in the ore, but occasionally coke is added to correct some defect in operations. A higher or lower temperature of the air blast, a variation in the pressure, high and low feeding, all have a direct influence on the running of the furnace. One may study the chemistry of blast furnace reactions in the office and the laboratory, but it requires actual experience about the furnace to make a smelter capable. The working of a furnace often destroys the student's preconceived notions, and causes him to introduce innovations and expedients not found in text books.

THE proposition to sink a drill hole near a shaft at Mogul, New Mexico, for the purpose of draining the shaft of water is ingenious, but it is of doubtful practicability. If the drill hole be located near enough to the shaft to affect the water in the shaft when a pump is in operation, the probability is that blasting in the shaft would so shatter the rocks that pumping would become impossible unless casing were used in the hole. If the drill hole be located far enough from the shaft to remain undisturbed by blasting in the shaft, it is doubtful if the water flowing into the shaft would be influenced to a sufficient extent to justify the expense of the drill hole and pump. A better scheme would be to put in a sinking pump—a small one at first, and substituting a larger one when it became necessary by increase of water. As the pumping must be done, it may as well be done in the shaft at once. There will be no difficulty in obtaining a sinking pump which will handle all the water that will probably be met to a depth of 500 feet.

THE right of the owner of a valid subsisting lode claim to follow his vein downward, outside of his claim side lines and beneath an agricultural patent, the title of which grant passed prior to the location of the mining claim, has never been determined by the United States Supreme Court, though Judge Sawyer, in the Ninth Circuit Court, in the case of the Amador-Medan G. M. Co. v. the South Spring Hill G. M. Co., ruled in the negative. The case was appealed to the United States Supreme Court, but, before the case came up for argument, both properties involved in the suit passed to a third party and the suit was quashed. In "Lindley on Mines" the author does not agree with the opinion of Judge Sawyer, and says: "The land covered by an agricultural patent is conclusively deemed to be agricultural, but this does not necessarily imply that a lode under its surface, apexing outside it, cannot be reserved without impeaching the patent and changing the legal character of the land. The two classes of grant may exist without conflicting in a legal sense."

AS THE statement from Director of the U. S. Mint Roberts, which appeared in the issue of the 9th inst., is uncontradicted by him, it is assumed to be a correct report of his assertion, viz., that there would be no more new silver dollars coined in any U. S. mint, and that the silver bullion purchased under the Sherman law is all minted. The Idaho, Colorado and Mexico inquiries are based on a mistaken premise. It has been ten years since there was any purchase of silver bullion under the Sherman Act. The accumulated bullion so purchased is now all coined. The Silver Coinage bill was passed as an intended reinforcement to the resumption act, resumption having been primarily on a gold basis. It is true that Congress can order the recoinage of silver, the purchase of silver bullion for such purpose, or anything else looking to a readjustment of specie payment conditions; but it is not likely so to do, nor is it at all probable that any material change from present conditions will be seriously contemplated by the present national legislature or its immediate successors.

THE chute doors of coarse-ore cinnabar roasting furnaces are usually made of cast iron, and are much heavier than the steel sheet doors of mine chutes generally. This is due to the fact that the ore is still very hot when it reaches the point of discharge, and an ordinary door is quickly so badly warped by the heat as to become useless. Quicksilver furnaces are sometimes run from two to four years without allowing the fires to go down. It is desirable to keep up fires in brick furnaces as long as possible, as the furnace usually suffers considerable damage from shrinkage and expansion when allowed to cool and the fires are again started. A quicksilver reduction furnace needs, of necessity, to be free from open shrinkage cracks, or those caused by expansion, as gases escaping into the air from such a furnace would be fatal to men employed about. The ore is not smelted, merely roasted, the heat only being sufficiently high to reduce the cinnabar from the mineral to the gaseous condition, from which it condenses into the liquid. The material treated ranges from screenings to pieces of ore 6 to 8 inches in diameter.

## California Mining Exhibit at St. Louis.\*

From Our World's Fair Special Correspondent.

The California mining exhibit at the World's Exposition, St. Louis, Mo., is located in section 71 of the Palace of Mines and Metallurgy, and near its southwest corner. The exhibit occupies a space of 43x103 feet.

At the entrance of the exhibit a beautiful arch has been constructed, which is representative of the structural materials of California. This arch furnishes in a practical manner an idea of the diversity of building materials to be obtained in California. While many States have adopted the scheme of archways for entrances to their exhibits, the California arch is said by many to surpass all others in magnitude, beauty of design and variety of materials. The arch, which was designed by State Mineralogist Lewis E. Aubury, who is also chief of the mining department, is 25 feet in height, 17 feet in length, 6 feet thick, and has an entrance 7 feet in width. The arch is composed of the following material, furnished by various firms, individuals and quarries as follows:

**GRANITE.**—Raymond quarry, Madera county, Raymond Granite Co.; Santee quarry, San Diego county, San Diego county; Folsom quarry, Sacramento county, State of California; Declez quarry, Riverside county, Los Angeles Times; Rocklin quarry, Placer county, Rocklin Granite Co.; Declez quarry, Riverside county, Los Angeles Express.

**SANDSTONE.**—Colusa quarry, Colusa county, Colusa Sandstone Co.; Sespe Canyon quarry, Ventura county, Ventura county; Alamo quarry, Solano county, Solano county; Caen quarry, San Luis Obispo county, E. S. Hoyt; Stony Point quarry, Sonoma county, Petaluma & Santa Rosa R. R. Co.; Contra Costa quarry, Contra Costa county, Wilson, Lyon & Co.; San Jose quarry, Santa Clara county, Jno. McGilvray.

**MARBLE.**—Columbia quarry, Tuolumne county, Columbia Marble Co.; Colton quarry, San Bernardino county, Colton Marble Co.; Artificial Marble (Mosaic), Henry Gervais, San Francisco.

**TERRA COTTA.**—N. Clark & Sons, San Francisco; Steiger Terra Cotta Co., San Francisco; Medallions (Seal of California and bears' heads), Gladding, McBean & Co., of San Francisco.

**GLAZED BRICK.**—Gladding, McBean & Co., San Francisco.

**TILING.**—Pacific Art Tile Co., Los Angeles.

**SLATE.**—Slatington quarry, El Dorado county, Eureka Slate Co.

**PRESSED BRICK.**—Los Angeles Pressed Brick Co.

It will be seen by the above list of exhibits that the material for the construction of the arch has been gathered from widely different sources, and the impartiality which has been shown in the selection of materials gives no particular section of the State any advantage over others.

The story of the selection and collection of the material which composes the arch is an unwritten one, and no one but the State Mineralogist can appreciate the difficulties which were encountered, and which have been surmounted, in giving to the California exhibit the finest entrance to any exhibit which that State has ever made.

After passing through the arch, the visitor first sees the model exhibit. Here are arranged a complete working model of a 5-stamp gold quartz mill, illustrating California mill practices. A tunnel is shown from which a carload of ore is run to the mill and the course of the ore can be readily traced from the time it is run over the "grizzly" down to the rock breaker, into the ore bins, to the feeder, and thence to the mortar, where it is crushed by the stamps. The process of amalgamating the gold and concentration of the sulphurets, together with other mechanical operations common to gold mills, are also shown. This mill was built by the Union Iron Works of San Francisco, and is exhibited by the California State Mining Bureau.

Adjoining the mill is a complete working model of a cyanide plant, exhibited by the Pacific Tank Co. of San Francisco and Los Angeles. An elevator lifts the tailings after they have been treated by amalgamation and concentration into a bin, from which they are distributed to the leaching tanks. Here a cyanide solution is allowed to percolate through the tailings, and most of the remaining gold not extracted by milling methods is taken into solution. From the leaching tanks the solution is run to the zinc boxes, where the gold is precipitated. The solution being freed of its gold contents is run to the sump tanks and is pumped back to be again used.

With the models the visitor is able to obtain a clear conception of the manner of gold extraction from quartz.

The method of handling gold-bearing gravel from the drift mines and the washing to recover the gold contents is shown by a model exhibited by the Hidden Treasure mine of Placer county, of which Harold T. Power is manager. Like the models already described, this practical model fully illustrates the practice in gravel mining operations.

Another model of much interest is exhibited by R.

H. Herron of San Francisco and Los Angeles. This model shows an oil derrick, with complete drilling rig.

Last, but not least, is an old rocker used in the early days of California, which illustrates the crude methods in vogue at that time. A number of mining curios and implements used in placer mining are also shown with this exhibit.

**PETROLEUM AND ASPHALT.**—Adjoining the model department, the authentic collection of California petroleum is exhibited. Here are shown first the different geological surface formations in which petroleum is found. With these are shown samples of oil sands taken from the different districts at various depths as they were taken from the wells. Duplicate samples show the same sand after having been washed and freed from its petroleum.

There are also included in the oil collection sixty-two samples (quarts) of oil which were taken from representative wells in all oil producing districts in the State; also twenty-four two-gallon samples taken from the different districts. With these are shown all the different grades of refined oils, illustrating the products of California petroleum. Then there are large samples of natural and refined asphalt, bituminous rock, California coal and coal formations, briquettes, etc.

Blocks or sections of oiled roads are also on exhibition, and the State Mineralogist loses no opportunity to expatiate on the superiority of oiled roads and the advantages of California petroleum in general.

In the corridor of the Mines Building is an annex to the oil exhibit. In this exhibit are shown an oil tank wagon and White oil distributor, and also a distributor manufactured at Stockton, Cal. Both of these are of the type used in oiling roads.

In the main oil exhibit is a photograph cabinet where the visitor can inspect views of everything pertaining to the oil industry. Here it is well to state that with the different mineral products and in each section of the exhibit, photo cabinets are arranged, and the finest collection of views of different classes of California mines and quarries, deposits, mills, etc., ever attempted, has been made.

With the oil exhibit is also exhibited and distributed literature published by the State Mining Bureau, giving reliable information concerning each sample of oil and a general description of the wells, names of owners, etc., also furnishing a commercial analysis of each sample.

To the side of the oil exhibit a stand some 12 feet high has been erected, on which is exhibited eighteen different mineral waters of California. The diversity of these waters occasions much surprise, and many inquiries are made concerning the same.

Parallel with the oil exhibit is the structural and industrial exhibit, in which are shown clays, limestone, mineral paint, blocks of building stone, the various classes of brick, terra cotta, tiling, soda, gypsum, cement from three different plants (showing cement in its different courses of manufacture), magnesite and its products, slate, asbestos, graphite, marble, glass sands, pottery, and many other products too numerous to mention are also shown.

With this exhibit a pyramid of nitrate of soda from the deposits of Death valley, Inyo county, is also shown. This is the only exhibit of its kind displayed in the Mines Building, California being the only State in the Union producing it.

Next to the niter exhibit a large block of diatomaceous earth from Santa Barbara county has been placed.

On each side of the main exhibit and facing the aisles the large show cases have been arranged, consisting of five on each side. Between each case large stands have been placed on which are arranged, pyramid shape, massive pieces of ore. The ores are arranged or classified by subject. Five stands and two show cases are devoted to copper ores, which are to the right of the arch. Next to the copper exhibit two cases of cinnabar ores, with two stands containing massive samples of the ores, have been placed. There is also an exhibit of native mercury from Solano county.

The copper ores are representative samples. The most prominent mines as well as many prospects are here represented. On two stands erected at the east entrance of the exhibit are shown large pieces of copper sulphide ores from Shasta county, the smallest pieces weighing 650 pounds and the largest over 1800 pounds. Bars of blister copper, flue dust and briquettes are also features of the copper exhibit.

Next to the cinnabar exhibit, massive samples of gold-bearing quartz from Tuolumne and Calaveras counties are displayed. Here we have a show case containing miscellaneous ores. Next that is a massive display of ores from San Bernardino county. Adjoining this is a large stand containing gold quartz from representative mines of Nevada county. Near this is also the large Empire block of ore, weighing 2200 pounds.

To the left of the arch is arranged on the aisle most of the gold quartz exhibit. Four large cases are devoted to the smaller-sized pieces and nine stands contain pyramids of the massive samples of ore. These ores are from all the counties but Nevada, that county having made a special exhibit.

The gold ores of the State, like the balance of the

exhibit, are as nearly representative of the average ore as it was possible to obtain. These ores were collected from Siskiyou to San Diego. The exhibit differs materially from those of past Expositions, insofar as no attempt was made to display gold specimens, with the exception of some \$2000 worth of gold quartz specimens purchased by the commissioners. The losses at previous Expositions of many fine specimens caused the State Mineralogist to refuse to accept any loans, unless the commissioners would furnish bonds. This they refused to do. Therefore, Mr. Aubury did not feel that he should assume personal responsibility for their safe return. Hence a large collection of fine specimens was not obtained.

Leaving the gold ores, one is attracted to what is the rarest and one of the most beautiful exhibits in the mines building, at the same time one of the most unique, viz., the lepidolite or lithia mica exhibit, the apex of which can be seen from most parts of the building. When this exhibit is seen from a distance, the visitor at once determines on a closer inspection. To the mineralogist, a large exhibit of this nature excites his wonder, while to the casual visitor the crystals of rubellite showing in the lithia mica, and the variety of coloring in the formation, appeals to the artistic fancy. Many demands for a specimen of the lepidolite have been made by visitors to the California exhibit.

In the construction of this exhibit, twenty-three tons of material were used. The exhibit is 12 feet in diameter at the floor, and rises dome shaped to a height of 9 feet. Surmounting the dome is a column 16 feet in height and 2 feet in diameter, or a total height of 25 feet. On the apex of the column is a ball 3 feet in diameter, in the center of which is a belt of crystallized quartz.

Below the floor an inverted dome extends to a depth of 8 feet, thus forming a grotto 17x12 feet. The grotto has four openings, from which a view of the interior, which is lit by electricity, can be seen. The lepidolite used is of variegated colors, from the white silvery gray to violet, and with the pink, green and black crystals of tourmaline form a most beautiful combination.

While it is recognized that the production of lithia mica is of comparatively minor importance, it being a new industry in California at this time, it is exciting much interest on account of the gems tourmaline and kunzite which are found in the formation. During the year 1902 tourmalines to the value of \$150,000 were produced, while lithia mica to the value of \$31,880 was also produced. The statistics for 1903 will undoubtedly show a large increase in the output of tourmalines, and to this will be added a large production of kunzite. San Diego county is believed to be the only place in the world where the latter gem has been found.

Potash minerals, besides the lithia, are also contained in the ore. Since the discovery of the gems in this formation, which caused much local excitement, the formation has been traced and several new deposits have been found.

The lepidolite exhibit was collected and shipped by the county of San Diego, not for the purpose of advertising any particular deposit, of which there are several, but in a general way to call attention to the mineral possibilities of the county.

Close to the lepidolite exhibit are two cases of the gems tourmaline and kunzite. These gems are shown in the rough and with the formations in which they are found; the cut and polished gems are also shown. These collections were loaned to the State Mineralogist of California by Schernikow & Co. and Tiffany & Co. of New York and by Frank Salmon of Pala, Cal.

Every variety of tourmaline is shown, and some exceptionally large and valuable specimens of kunzite are displayed.

Prominent among the exhibits is that of borax, which occupies a space of 20x20 feet and adjoins the lepidolite. The Pacific Coast Borax Co. has a fine exhibit of both crude and refined borax, showing the latter in several different forms. Booths constructed of crystallized borax serve to make the borax exhibit an attractive one. Moving pictures, showing Death valley and vicinity, methods of mining borax, as well as other California views, are a feature of this display. California produces practically all the borax consumed in the United States, having produced in 1902 of borax and boric acid 17,202 tons, at a value of \$2,234,994.

The Pacific Coast Borax Co. is also presenting one of the novel features of the Fair, which serves to advertise California borax, in connection with the exhibit displayed in the Mines Building. A twenty-mule team, with main wagon, trailer and water wagon, are driven about the grounds by "Borax Bill" (Parkinson), whose driving with a "jerk line" excites the wonderment of the public. Free rides are given to those who wish to enjoy the novelty of riding on a "desert auto," and behind one of the finest mule teams California can produce. The team and wagons were brought from San Bernardino county and are one of the "sights" of the Fair.

On one side of the borax exhibit are cases devoted to silver, lead and iron ores, and to minerals of a miscellaneous nature of minor importance. Large stands are also filled with iron and manganese ores.

Here also is a case containing gold quartz specimens and placer gold, which were purchased, and of

which about \$2000 worth are shown. There are also plaster casts of various historical nuggets which have been found, among which is the Marshall nugget.

Back of the borax exhibit Nevada county has placed a mineral cabinet 20 feet long and 11 feet high. In this cabinet are specimens of ores from all the prominent mines in Nevada county, and a collection of placer gold. As at past Expositions, Nevada county—the leading gold county of the State—presents a beautiful collection of gold ores, many fine specimens being exhibited. In addition to the gold cabinet, two large stands are devoted to massive gold quartz. A prominent feature of the Nevada county exhibit is the cabinet of gold specimens presented to President Roosevelt on his visit to California by the citizens of Nevada county. The cabinet is secured by a gold padlock and key. This cabinet attracts much attention and is always surrounded by a crowd of admiring visitors.

At the rear of the main exhibit an information bureau has been erected. Here information published by the State Mining Bureau is being distributed, and the reports and bulletins of this department can be consulted in the booth erected for that purpose, and information is furnished concerning the mineral deposits of the State and all branches of the industry.

In this booth are on file various papers published in California.

Dividing the California and Colorado exhibits is a large partition. On this is displayed a large relief map of the State, with mineral maps of the counties,

California Mineral Exhibit Looking South, St. Louis Exposition.

showing the location of mines and deposits. An oil portrait of Marshall, the discoverer of gold in California, occupies a prominent position. Enlarged photographs are also displayed, as well as the photographs displayed in a cabinet for that purpose close at hand.

At one end of this exhibit has been placed an old Mexican ladder, used in the early days; also a seron, or leather bag, which was used by the miners in carrying ores from the mines.

Conspicuously displayed over the exhibit in various places are green silk banners, bordered with gold, on which are lettered the value of and amount of production of the various mineral substances. A large gilded cube shows the average annual production of gold in California.

It would seem that every means had been used by Mr. Aubury throughout the exhibit to properly label and display to the best advantage California minerals, but, while the space occupied by the exhibit is larger than that of any other, had it been greater the exhibit could have been shown to better advantage.

Considering the many adverse conditions met with in collecting and installing the most varied display of any State or country, and with almost no assistance from the mining counties, it is remarkable that such a display has been made.

**OUTSIDE EXHIBIT.**—Situated in California Gulch,  $\frac{1}{2}$  mile southwest of the Mines and Metallurgy Building, is the milling exhibit, which occupies a space of 200x300 feet. A substantial mill building 60x60 feet has been erected, and in this has been installed a complete Hendy 3-stamp mill, which is now ready for operation. Next to the Hendy mill a Lane 7-foot

rotary mill of the Chilean type has been placed.

Below the mills are three different types of concentrators, viz., the Pinder, New Standard and Woodbury, which are all complete and ready for operation. In the building is also erected a Mitchell slag steam generator.

Outside of the mill is located an old wooden stamp mill. This mill was erected in Shasta county in 1853, being the third erected in California. It will prove of much interest as showing the crude methods of quartz crushing in early days, as compared with those in use at the present time.

Mr. Aubury has at comparatively small expense put in a modern milling plant, and one which will reflect credit on the California mining exhibit.

Under the direction of practical mine operators, an exhibit of the Pennsylvania anthracite mines has been prepared in the mining gulch at the World's Fair. In a ride on mine cars through the underground passages of a great anthracite mine, visitors will see exemplified the life of the 145,000 men and boys.

Mining scenes are reproduced in underground chambers. Life-sized figures of men and animals, moving automatically, are used. They start in the mine buildings on the surface and run through tunnels in the coal 1260 feet long. The mine buildings are 236 feet long, 80 feet wide and 60 feet high, being reproductions of those used in the anthracite field. There are eight typical mine scenes illustrated in the underground passages along the line of the electric tramway. One shows the miners as they are going down to their work in the morning. Three shifts of miners go down daily, each for eight hours' work.

Another one shows the slate pickers at their task of sorting the slate from the coal in order that they may send clean coal to the market. This work is done by boys who work eight hours a day, seated on narrow boards across the top of the chutes. A third scene shows a party of miners at meal time and recreation, while a companion scene shows miners at work with a pick and drill getting the coal ready to be carted out of the mine. The fourth scene shows the horrors of a flooded mine in which a party of miners were imprisoned waist deep in water for nine days without food or drink.

Another scene illustrates the constant danger to miners. This is an explosion scene which is usually caused by fire damp or a short time fuse that makes a premature blast, often killing the miners and mules in its immediate vicinity. The injured are cared for in an emergency hospital which is maintained at the foot of the shaft in the mine.

In another scene the visitor gets a view of an underground stable where the mules, blinded by their life underground, spend their days, never going above ground except when the mine is shut down for a long time.

The last scene shows the miners coming out from their day's work ready to go to their homes. Altogether the exhibit is a realistic one, and the ride through it on the tram cars is veritably

a scenic railway on which hundreds daily have the pleasure of being instructed in the features of one of the great industries of the United States. The mine is located in the mining gulch opposite the Maine State building.

**THE MISSOURI LEAD AND ZINC MINE.**—This is a reproduction of a typical mine in the Joplin district of southwest Missouri showing how lead, zinc and marcassite occurs in the ground. The mine was reproduced by miners of many years experience in the Joplin district and is as true to nature as it is possible to be made.

In the "calcite room" is said to be one of the finest exhibits of beautiful specimens ever collected. The collection of lead ores contains every specimen that could be found in years of research, some of them being valued at hundreds of dollars. One especially beautiful specimen weighs about 150 pounds and shows rare peacock hues that make it extremely beautiful.

The mine is also so constructed as to show the method of timbering in mines. The mine is cooled by a 6-foot fan which makes it possibly the coolest spot on the entire Exposition grounds.

**THE CARIZZO COPPER EXHIBIT.**—This exhibit shows a primitive copper mining camp operated by Mexican Indians. All the work is done entirely by hand. The ore is first crushed, then washed in wooden dug-out troughs in order to wash away the useless material. It is then put into a large furnace and roasted for forty-eight hours, in order to desulphurize the ore, after which it is put in the smelter with charcoal and smelted, the ore running down and forming in a molten mass in a small pit at the base of the smelter. The copper is then separated from the cooled mass

and is again melted in order to rid it of impurities, after which it is cut into small pieces and hammered into various forms of copper vessels by a half dozen Aztecs who stand around an old-time anvil and beat the copper into thin sheets. After this it is worked into the various designs intended.

Senor Timoteo Panduro, a sculptor, entertains visitors in his art of making busts.

**THE CRYSTAL WIND CAVE.**—A party of citizens of Deadwood, South Dakota, wishing to show one of the State's most wonderful natural curiosities, has reproduced in detail many of the most beautiful chambers of the original cave, showing some of the finest specimens of stalagmites and stalactites brought from the original cave, which is owned by the United States Government. About 300,000 pounds of crystals were used in reproducing this cave, and it is one of the most remarkably beautiful exhibits that has ever been the feature of any exposition.

## Gold Milling.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by  
ALGERNON DEL MAR.

Clean-ups may take place once or twice a month, according to the richness of the ore or other reasons. The first thing to do is to hang up the feeder and stamp the battery as dry as safety will permit, the object being to leave as little sand in the battery as possible. Next hang up the stamps on the fingers and turn off the water. Then rub up the plates with a whisk broom, beginning at the upper plate, and take off with rubber and scoop all the loose amalgam. A little mercury sprinkled on the plates from a canvas-covered bottle or a canvas bag before rubbing up will often help if the amalgam is thick or hard. This is the same procedure followed for the daily clean-ups of the battery plates. If a splash plate is used, this is taken off, washed and scraped. Then knock out the iron wedges, take off the screen and lay aside for washing. Take out the chuck block, lip plate and back plate and scrape off the amalgam. The scraping tools may be an iron chisel, an old file with a chisel edge or a putty knife. Then take out the sand and the dies. If the false linings of the mortar do not fit close, these may be taken out. The sand and all the scraps that are not pure amalgam, including all iron holding amalgam, go into the clean-up barrel, where a quantity of mercury is added and the barrel revolved for four or five hours—sometimes longer—and then washed out. The excess of mercury may then be squeezed through canvas or buckskin, after using a magnet to extract iron particles.

If new dies are needed, these are put in the mortar, first spreading a layer of about half an inch of sand to protect the bottom of the mortar. They are then held in place with iron wedges or simply tamped with coarse rock. If new shoes are required, the old ones are forced off with a steel wedge and the new ones put on. The wooden wedges that hold the shank of the shoe to the boss may be held in place by tacking to a strip of canvas or by a piece of string. These wedges should be thick enough to prevent the shoe from coming into contact with the boss, or the iron rings that are shrunk on the boss to strengthen it may loosen. The tappets are then loosened and set to give the stamp the required drop, the back plate is put in and bolted to the mortar, the lip plate, chuck block and screen put in and wedged, and the battery plates sprinkled with mercury and well brushed.

There is some difference of opinion whether plates brushed transversely or lengthwise give the best results. The former leave riffles and hold sulphurets, while the latter allow the sulphurets to pass off and, I believe, give as good results. A compromise might be made by brushing at an angle toward the center and down.

The splash plate is then put in and the battery is ready for the water to be turned on, the feeder prepared for starting and the stamps let drop. In starting a battery it is preferable to let the middle stamp drop first, then the two outer ones. This starts the screen discharge better than if let drop in succession.

The amalgam from the various sources of the clean-up is rather dirty, being mixed with sulphurets and iron. The coarse iron is eliminated by diluting with mercury and using a magnet, while the sulphurets and fine iron are got rid of by grinding in an amalgam grinder with a flow of water. To save time this grinding is continued long enough to get the amalgam homogeneous and the impurities sufficiently fine to be able to use a magnet and pan. A copper bottom pan is useful for this purpose. The amalgam is then squeezed through buckskin or canvas, the resulting balls of amalgam being ready for the retort and the smelting furnace. These last two operations the assayer has charge of, so will not be further considered here.

It is presumed that the beginner has some knowledge of boilers and engines; at all events it would probably be best for him to start where he can get an idea of the mill routine. A job on the concentrator floor or on the rock breaker gives one a good

start, especially the former, as he may be often called to help the mill men.

The first lesson to learn is the feed of the battery, so that he can judge by the wave on the screen and the "feel" of the stamps whether too much or too little ore is being fed. As he becomes more expert, the sound produced by the falling stamps will tell him a great deal more. Do not get the screen covered with ore so that no splash is seen, or do not let the battery get so dry that the clank of iron on iron is heard. The former will necessitate hanging up the feeder or, maybe, taking off the screen and cleaning out the mortar, and the latter may cause a broken stem and the consequent hanging up of the battery and stripping of stem.

Another duty which the novice must soon learn to perform, and one involving some personal risk, is the hanging up of the stamps. To one unacquainted with this operation, who sees an old practiced hand quickly hang up a mill of sixty stamps, it seems easy; but it is quite the contrary and requires quickness, knack and muscle. However, it is something easily acquired with a little instruction and experience.

The second lesson is to amalgamate properly. It is better to feed a little mercury often than a larger amount at long intervals. Do not use oil on cam shafts, but some compound or axle grease, and do not let any get to the mortar. Use ordinary sense, and, if anything goes wrong, keep cool and either hang up the battery or slow the engine down and find the trouble.

## Mining and Ore Treatment in Western Australia.\*

NUMBER III.

Written by DONALD CLARK.

When ore was first treated at the Boulder it was assumed that the old-time methods would be good enough; the gold was got, the tailings were waste products. Battery work, followed by pan amalgamation, was looked upon as perfect. Fortunately there were no running rivers in which they could hide evidences of bad work. Tailings heaps remained to be sampled, and the army of assayers and scientists from other States, Germany, England and America, showed that altered methods were necessary. The tailings heaps were cyanided, and the difficulty of extraction was declared to be overcome; roasting and cyaniding were introduced, and yet the recovery of gold was not satisfactory. Rich tailings were hidden and buried in the stopes of some mines. A new word was necessary, since the tailings from such operations were rich enough to be re-treated. Residues was applied to such payable sand, and tailings to the final material going over the dump. Then commenced a series of rival methods of treatment. Claims were always put forward for over 90% extractions. Yet even after this tailings often became residues, from which as much as 16 dwt. per ton were extracted. Each man did what was right in his own eyes, and though in many instances the process has been fearfully extravagant so far as companies are concerned, as silently testified by the "hospitals" or masses of unused or discarded machinery; yet out of the chaos has emerged a few interesting and original processes, which will serve as stepping stones to future advancement. The end is not yet come. Even now the rivalry does not appear to have ended; tailings heaps are said to be guarded in some instances against would-be intruders, who are anxious to know the value of the tails, "for fear tellurides might be stolen," as one manager facetiously remarked.

From a treatment point of view, the Boulder ores cannot be looked upon as specially refractory. For instance, they cannot be compared with those at Bethanga or Cassilis in Victoria, nor with many ores in central and northern Queensland. There are two difficulties to contend with, the former being due to the presence of tellurides, the second that the gold is so fine and so encased that the finest grinding is necessary to free it. Treatment with special solvents, such as cyanide of potassium, with bromo-cyanide, or roasting, is necessary to overcome the first difficulty, while the second necessitates sliming the whole of the ore and the attendant difficulties in treating it.

The Great Boulder Co. started with the battery and pan amalgamation system, but afterwards, with the knowledge gained from the nature of the ore, erected a special plant to deal with the same; while the tailings which had accumulated were dealt with specially also. Analyses of the oxidized sulphide ores are given:

	Oxidized.		Sulphide.
SiO <sub>2</sub> .....	65.80	SiO <sub>2</sub> .....	74.85
Al <sub>2</sub> O <sub>3</sub> .....	8.44	Al <sub>2</sub> O <sub>3</sub> .....	1.75
Fe <sub>2</sub> O <sub>3</sub> .....	17.39	FeS .....	5.40
Fe <sub>3</sub> O <sub>4</sub> .....	0.46	FeCO <sub>3</sub> .....	8.22
CaO .....	0.37	CaCO <sub>3</sub> .....	7.03
MgO .....	0.13	MgCO <sub>3</sub> .....	4.76
NaCl .....	0.50	K <sub>2</sub> O Na <sub>2</sub> O .....	1.40
H <sub>2</sub> O (combined) .....	5.15	H <sub>2</sub> O (combined) .....	.25
	99.24		98.76

As previously mentioned, there are two distinct classes of machinery for the treatment of the oxidized and sulphide ores. The oxidized ore and a portion of

the sulphide free from telluride is put through the usual stamp battery, followed by amalgamation and cyaniding. The machinery for treating the sulphide is of an altogether different type, the ore being dry crushed, roasted, pan amalgamated, and cyanided. The ore is brought from the main shaft in box cars, having a capacity of 14 cwt. each. These are pushed into a kick-up, and discharge their contents into a No. 5 Gates breaker fitted with a manganese steel mantle instead of the ordinary chilled solid head. One mantle in use crushed 80,000 tons of rock from pieces up to a hundredweight down to a gauge of 2 inches before it was replaced. This breaker is driven by a 14-inch rubber belt, from a 5-foot 6-inch friction clutch pulley placed 60 feet from the breaker. The breaker wheel runs 400 revolutions per minute, and absorbs about 50 H. P. Its capacity is 170 tons in eight hours. The broken material is delivered into a revolving trommel, having inch screens. The fines when dry drop on to a 14-inch belt conveyor, and are carried direct to the mill bin; if they contain more than 3% of water they are passed through a Howell White pattern revolving drier, and then elevated to the bins. The coarse lumps from the trommel fall on to a grasshopper conveyor, having discharge doors 6 feet apart; these doors are regulated so that a 500-ton bin may be evenly filled. The ore is taken from this bin by three automatic feeders, and dropped on to shaking troughs, which deliver it into three breakers, each having a capacity of 100 tons per twenty-four hours, crushing the rock down to 1 inch gauge. These are driven at 600 revolutions per minute. The crushed ore falls on to a 14-inch conveyor, thence into a truck, which is tipped into the mill bin. The ore is broken, crushed and pulverized in a rotary mill. By means of a fan fixed on a shaft, the pulverized ore is blown through the screen, and falls through a series of slots into a receptacle below, whence it is continuously removed by means of a spiral conveyor. The pans and screens are encased in an iron cover, while on top is fastened a conical shield, through which the shaft works. At the Boulder, the annular space between the shaft and the top of the shield is usually covered by a piece of bagging to prevent dusting. The mills are fed automatically, and on the under side of the roll or disc are ploughs or shoes, which prevent the ore from packing below. They scoop up the uncrushed material, and throw it between the ring and disc. The disc, which is capable of rotation on the shaft, travels round the ring, revolving in an opposite direction to the swinging circle described by the shaft. The pressure between the roll and ring is said to amount to about 6000 pounds.

A remarkable feature is the fineness of the product from a comparatively coarse screen. For instance, at the Boulder, where a 15 woven wire mesh is used, it is found that 80% will pass through a 120-mesh screen. The pulley is driven at a speed of 135 to 150 revolutions per minute.

The dust is drawn away from the mills through a zig-zag pipe by a fan and settled in a large chamber. The pulverized ore is conveyed by a spiral conveyor to a double push conveyor 180 feet long. From this the ore is distributed to twelve shoots, each leading to an Edwards furnace. They are of the standard type, 64 feet long, swung on trunnions, and set for the local ore with an elevation of 15 inches. The upper rabbles are plain cast-iron; the lower ones are water-jacketed. When wood is used for fueling, 15% of the weight of the ore is found to be necessary. It was discovered in roasting this ore that the furnace was unnecessarily long for the operation. If any roasting went on in the upper portion the lower part became too hot and led to fusion of the ground material; the ore in itself, containing such a small quantity of sulphur, supplied such a small amount of heat to the furnace that the conditions which held with concentrates did not apply. In order to supply sufficient heat, so that the temperature should be high enough to induce the necessary chemical changes, recourse was had to gas firing. This was supplied through the crown of the furnace at various points, and has overcome the difficulty. They are fed with coal, saw-dust, chips, and like materials. The gas so produced is led away to any part of the furnace which requires it. The roasted ore contains from 2% to 3½% of sulphur as sulphates, and .18% to .2% of sulphur as sulphide.

At the Great Boulder mine the furnace in use consists of three hearths, superimposed above each other, each hearth being 23 feet long, 8 feet wide, and about 12 inches from the floor of one hearth to the bottom of the next, the hearths themselves being about 12 inches thick. The ore is delivered automatically into a hopper on top of the last hearth near the flue end; from the hopper it is fed on to the first hearth. It is worked automatically by rabbles until it comes to the end; from this it may be dropped through a discharge chute on to the second hearth, along which another set of rabbles cause it to travel towards the flue end; from this it drops on to the third floor, and it travels along this towards the fire-box end. It drops through a chute on to a short fourth floor, where it either can be in the hot-test part of the furnace, or be worked with a single rabble, after which it may be discharged.

The modification of this furnace for silver roasting or chloridizing is arranged by having a chute from the last hearth mentioned discharging into a revol-

ving cylinder, which has a movable fire-box at one end.

There are four rabbles working on each hearth, each being 4 feet in length. Three revolve in one direction, and are always in the same or in parallel lines; the fourth revolves in the opposite direction, and is at right angles to the others. The rabbles are attached to vertical shafts, of which there are four, through the three-hearth furnace, and one through the single hearth. Those through the three hearths are 5 feet apart, and pass through the bottom floor to an archway, where each is supported on a foot-step. They are all water-jacketed, and are driven at a uniform rate by bevelled cogwheels attached to a horizontal shaft working into corresponding wheels on the upper end of the vertical shaft. Provision has been made for removing or replacing rabbles without having to cool down the furnace. Inspection doors are provided on each floor opposite the rabbles. The furnace is stayed by means of railway rails placed as girders, and connected together above and below the hearths.

The cylinder on the chloridizing furnace is 10 feet long and 6 feet in diameter. It is lined with fire-brick, arranged so as to taper from the feed to the discharge end. The movable fire-box is a brick-lined furnace set on wheels. The flue passes into the center of the end of the cylinder.

The air is allowed to pass into the ordinary furnace through the fire-box, where it is partly consumed; the excess of oxygen in air, the nitrogen, and products of combustion pass over the ore lying on the last hearth, thence over a short bridge along the third hearth. At this point, if desired, the gases may be sent through the flue without traversing the upper hearths at all. Otherwise, as is usually the case, the air passes back over the second floor, and escapes through a flue capable of being closed by a damper on to the upper floor, from which it finally passes away.

(TO BE CONTINUED.)

## Jeffrey Grab Buckets.

Illustrated herewith is "Class A" grab bucket recently brought out by the Jeffrey Mfg. Co., of Colum-

bus, Ohio, for handling lump and run-of-mine coal, who say:

"Its path is such that it is absolutely self-filling under all conditions and the weight of the enclosed coal assists the bucket to close. The lines on which power is applied are such that the entire weight of bucket and load is utilized at closing with sufficient force to crush the largest lumps should they come between the scoops. These buckets are made in the most substantial manner to withstand hard usage, and in sizes of from 15 to 160 cubic feet capacity, and are used in unloading coal of any commercial size from cars, vessels or barges, for shipment or stocking, also for reloading from storage piles. A booklet describing this class of machinery is issued by the manufacturers, which they are pleased to send to all interested."

## Retorting Amalgam.

TO THE EDITOR:—Referring to "Concentrates" article of July 2, on the "Danger of Explosion From Retorting," I will say that there is a possibility, when not allowing the fire to go down during the retorting, to melt some gold in the bottom of the retort. The temperature of the fire is also difficult to control.

I have found satisfaction in using a retorting pipe which does not dip in the condensing water, but comes 1 or 2 inches above its surface, the end of said pipe being wrapped with a cloth which dips in the water, and shall be kept continuously wet by means of a sprinkler or a dipper. It is a little more trouble to take, but in my opinion the only way to be absolutely safe from explosion coming from the pressure of the air on the surface of the water.

N. E. IMHAUS.

## The Ore Deposits of Bisbee, Arizona.\*

NUMBER III.

Written by F. L. RANSOME.

Similar chalcocite and pyrite ore was noted on the fourth level in the old Dividend stope, northeast of the Holbrook shaft. Just above the same level, about 500 feet south of the Spray shaft, a stope has been opened on a mass of solid, compact chalcocite, intimately mixed with a little bornite. The chalcocite immediately overlies ferruginous oxidized material. Close to the copper glance, and cut in the drift near the stope, is a body of pyrite, the individual granules of which are in part covered by a black coating of chalcocite. Development had not gone far enough at the time of visit to discover what connection, if any, exists between this body of pyrite and the chalcocite ore body, or to show what overlies the latter. All of the ore is inclosed in altered mineralized limestone, into which the pyritic mass passes by insensible gradations.

Some chalcocite occurs on the fifth level of the Copper Queen mine, but it was not seen below this, in the deeper levels connected with the Spray shaft.

By no means all of the occurrences of chalcocite in the Copper Queen mine have been here recorded, but those mentioned are enough to indicate the general mode of its occurrence and distribution, and to illustrate its characteristic association with masses of pyrite on the one hand and with oxidized ores on the other.

In the Calumet & Arizona mine chalcocite is found associated with cuprite, limonite, malachite and brochantite (a basic sulphate of copper) in an ore body about 400 feet south of the shaft, on the 850-foot level.

On the 950-foot level the ore in what is known as "the big sulphide stope," about 650 feet east-northeast of the shaft, consists chiefly of pyrite, with which is intimately associated dull cryptocrystalline chalcocite in the form of a thin coating on some of the pyrite grains. At one point in the stope the ore consists of pyrite and chalcocite in a hard quartzose gangue. The microscope shows that the sulphides are embedded in a matrix of granular quartz. The chalcocite is seen to occur as an envelope about many of the pyrite grains and to fill microscopic fissures in the latter. This ore body shows incipient oxidation at a height of about 15 feet above the level.

Chalcocite in similar close association with pyrite is found also on the 1050-foot level, particularly in a body of mixed sulphide and oxide ore about 300 feet east of the shaft, where the chalcocite occurs as irregular envelopes around residual masses of lean pyrite. Chalcocite, in the condition of a soft, black powder, was noted also in the main drift on this level, 500 feet east of the shaft.

As a rule, on the 1050-foot level, wherever the pyritic masses are soft and traversed by fissures, they constitute workable ore. The miners know that when their picks leave dark, metallic marks the ore is good. Close examination of such ore always reveals the presence of chalcocite, and it is the shining streak of this mineral that gives the miner his rough but effective test.

In the Lowell mine chalcocite occurs on the 1000-foot level in a soft, black earthy form with partly oxidized pyrite, and on the 1100-foot level in a similar association. It is also found on the latter level in a more compact form, associated with pyrite, native copper and malachite, and resting upon a body of lean pyrite cut by the shaft.

Outside of the larger mines chalcocite is found irregularly but widely distributed through the large area of Glance conglomerate stretching from Gold Hill southward to the international boundary. The mineral occurs in minute reticulating veinlets, often microscopic in size, and in little rounded bunches, rarely over  $\frac{1}{4}$  inch in diameter, usually inclosed within a thin envelope of malachite. The chalcocite is usually accompanied by the development of a secondary quartz in veinlets and small vugs. Both chalcocite and quartz have in part filled minute fissures in the conglomerate, but have also in part replaced some of the finer interstitial, calcareous matrix by which the pebbles are held together.

The mass of conglomerate forming the hill just west of the Glance mine exhibits well the scattered mineralization just described. The occurrence of this chalcocite in the Glance conglomerate has led to extensive prospecting, which has not, however, revealed workable ore bodies.

About 1000 feet northwest of the No. 3 shaft of the Lake Superior & Pittsburg Co. chalcocite, altering to malachite, occurs in a little vein in Martin limestone. This is the only observed instance in the quadrangle of the occurrence of the mineral in a fissure vein.

**MALACHITE.**—The familiar green basic carbonate of copper is found in greater or less quantity wherever copper ores are undergoing oxidation. In the older workings of the Copper Queen mine this mineral was abundant, occurring in large and beautiful masses with azurite and calcite in limestone caverns. The walls of these caves were covered with velvety,

moss-green malachite, and sparkled with the blue crystals of azurite, while from the roofs hung translucent stalactitic draperies of calcite, delicately banded and tinted with the salts of copper. But the caves have been stripped of their treasures and either filled with waste or allowed to collapse. They are things of the past, and museum specimens, of which perhaps the finest collection is that in the American Museum of Natural History in New York, can but feebly suggest their former splendor.

The malachite occurred in the form of mammillary incrustations, which, while often of considerable thickness, were of fibrous texture, and not adapted to ornamental purposes.

In the present workings of the Copper Queen mine malachite is not abundant. It occurs usually in little nests and bunches in soft limonitic ore containing earthy cuprite. The presence of little green specks of malachite in such ores is generally indicative of a high tenor in copper.

The Calumet & Arizona mine exhibits similar occurrences, but the mineral is here found also in vugs within masses of crystalline cuprite and native copper.

In both the Copper Queen and Calumet & Arizona mines malachite is frequently associated with small amounts of brochantite, a mineral easily mistaken for the green carbonate, and with chrysocolla. Nowhere at the present time does it constitute more than a very small proportion of the ore.

**AZURITE.**—The blue basic carbonate of copper, while formerly fairly abundant and occurring in large crystalline slabs in the oxidized ores in the Copper Queen mine, is now seldom met with except in occasional little bunches in the earthy ferruginous ores of the thoroughly oxidized zones.

**CERUSSITE.**—The carbonate of lead occurs in impure sandy form, the so-called "sand carbonate," in Hendricks gulch, where it forms very irregular bunches in the limestone in the vicinity of a fault fissure. It was not observed in connection with the copper ores in the larger mines.

**CHRYSOCOLLA.**—The hydrous silicate of copper, like malachite, azurite and brochantite, is a minor constituent of the Bisbee copper ores, and seems never to have been very abundant. It was noted in the Calumet & Arizona mine forming thin concentric shells about kernels consisting of crystalline cuprite, native copper and brochantite, and enveloped in turn by malachite and calcite. Intimately associated with the chrysocolla is a lustrous, brittle, pitch-black substance which Koenig has recently described as a new mineral species and named melanochalcite.

**MELANOCHALCITE.**—This is described by Koenig as forming a thin envelope about kernels of cuprite and inclosed in turn by chrysocolla. It is black, with a pitchy luster, and apparently amorphous. According to Koenig's chemical analyses, it is a silico-carbonate of copper with the formula  $\text{Cu}_2(\text{Si}, \text{C}) \text{O}_4 \cdot \text{Cu}(\text{HO})_2$ .

Material identical with that described by Koenig was obtained from the same locality, namely, the 850-foot level of the Calumet & Arizona mine. It occurs as thin shells about nuclei consisting of crystalline cuprite, native copper and brochantite. Under the microscope the melanochalcite is opaque in an ordinary thin section. It is inclosed by a concentric envelope of olive-green material, which is fairly transparent. The olive-green substance is traversed by reticulated microscopic cracks, shows concentric banding, and with high powers a rather indistinct radially fibrous structure. In color and structure it suggests chrysocolla, but unlike common chrysocolla it is apparently isotropic. This material is in turn enveloped in chrysocolla showing the usual optical behavior of that mineral, and the chrysocolla is succeeded by an outer shell of malachite.

**AURICHALCITE.**—This mineral, a basic carbonate of zinc and copper, has been reported from the Copper Queen mine, but none was seen in 1902.

**BROCHANTITE.**—This green, orthorhombic, basic sulphate of copper is not abundant in the Bisbee quadrangle, but has been noted in small amounts, often associated with malachite, for which it might be readily mistaken upon superficial examination.

As a rule it is recognizable in the Bisbee ores only by the microscopical examination of thin sections. Its most characteristic occurrence is in the form of little nests and irregular veinlets in the cuprite of the Copper Queen and the Calumet & Arizona mines. These nests and veinlets are aggregates showing a pale bluish-green tint by transmitted light, and composed of irregular granules with a decided tendency toward prismatic form. They exhibit a distinct cleavage.

Brochantite is not sufficiently abundant to form an important constituent of the Bisbee ores, and its occurrence in the district has not been previously recorded.

**CUPRITE.**—The red oxide of copper is an abundant and important constituent of the Bisbee ore bodies. It occurs sometimes in an impure earthy condition mixed with limonite and ferruginous clays, sometimes in crystalline masses associated with native copper. The latter occurrence is particularly characteristic of the deeper oxidized zones in the vicinity of chalcocite and other sulphides.

## Copper Ore and Garnet in Association.\*

Written by WILLIAM P. BLAKE.

The mineral, garnet, is a common associate of copper ore in the southwestern portion of the United States. This association may be observed on a large scale in southeastern Arizona, in southern New Mexico and in Sonora, Mexico, especially at El Cananea, and at Nacosari. At other localities in Mexico the general occurrence of garnet "as a contact metamorphic mineral" in the copper deposits of the Cretaceous limestone has been noted by Jose G. Aguilera.

It is usually found at the contact of limestone with diorites, granites, etc., at numerous mines. The same authority also cites the occurrence of garnet in metamorphosed Cretaceous limestone alongside of diorite dikes in association with iron ore.

Other foreign examples are found in the Banat and Servia, at Rezbanya in Hungary, and Offenbanya in Transylvania, and at Bogoslovsk in the Urals. In New South Wales, at Broken Hill, the gangue in the Proprietary mine is chiefly garnet, with quartz, opal and rhodonite, according to W. Lindgren.

Also, in a recent paper by George Smith, entitled "The Garnet Formations of the Chillagoe Copper Field, North Queensland, Australia," it is shown that in the copper field of Chillagoe, Australia, where there are many lode formations, about one-half of the number are garnetiferous, and many of this garnet type are associated with magnetite, which is regarded as of analogous origin. The two minerals are found merging imperceptibly into each other.

These examples suffice to show the very general and wide distribution of garnet as an associate of copper ore.

In addition to the localities already mentioned as known in Arizona may be mentioned the copper mines and occurrences in the Dragoon mountains and in the Santa Rita range south of Tucson. Also in the Tucson mountains; in the Serritas, the Santa Catalina mountains and the copper mines of the Lower San Pedro, near Dudleyville. Two more important and instructive examples are found in the mines of the Twin Buttes Co., south of Tucson, and in the property of the Imperial Copper Co., in the Silver Bell district, west of Tucson. It also occurs at the Atlas property, in the northern continuation of the Imperial mine.

These and other examples which might be added are sufficient to show that in Arizona, as elsewhere, it is the rule, with scarcely an exception, that wherever either a plutonic ejection traverses limestone, or follows a plane of contact of the limestone and another rock and has the conditions requisite for metamorphic action, then garnet, and sometimes other silicates, are developed and are found with the copper ore. So, also, is garnet found in reefs or beds at and near the plane of contact with limestone with a granitoid rock. This reef formation may be seen to an unusual extent at the Twin Buttes property, where there is a series of garnet reefs in parallel lines along and near the contact with the granite, which appears to be eruptive. These reefs are copper bearing and have the semblance of regular lodes. One evidence of the igneous intrusive character is the alteration of the blue, or dark colored, limestone to white, crystalline limestone near the contact.

Both at the Twin Buttes mine and the Imperial mines, where the garnet formations are much more massive, copper ore in the form of sulphide, usually chalcocopyrite, is disseminated in the midst of the garnet in the form of grains, stringers or nodular masses. Such masses are found completely enveloped in garnet and are evidently of contemporaneous origin. Large blocks of massive garnet rock quarried at the Twin Buttes often disclose, on breaking, nodules of copper sulphide so completely inclosed in a dense, granular, garnet magma as to be fully protected from atmospheric agencies, remaining unchanged, and even unoxidized, in the croppings exposed to the weather. The occurrence of copper sulphides in a more or less vein-like or tabular form is also to be noted as indicative of deposition in open spaces. This form of occurrence may be seen in the huge garnet croppings of the Silver Bell (Imperial) and Atlas ground, particularly where quartz vein stone is largely developed, the garnet itself having a tabular, vein-like structure. In such cases the garnet cannot be regarded as other than a true vein stone or gangue, and the garnet reefs as having the nature of lodes—a conclusion which is sustained when, as is often the case, vein-like inclusions of free quartz are found parallel to the general course of the main reefs of garnet rock, and in the midst of the garnet.

The garnet found in association with limestone is usually the variety known as grossularite, the calcium-aluminum garnet, without iron enough to give it much color, but the wine-yellow and cinnamon-brown colors are common.

At the Cananea copper mines in Sonora, Mex., there is a fine example of the conversion of a considerable area of limestone into garnet rock without the complete obliteration of the original bedding-planes, or partings, of the strata. This may be seen

\*Abstract Professional Paper No. 21, U. S. G. S.

\*Trans. Am. Inst. Min. Eng.

between the croppings of the Veta Grande and the Democrita mines at the place where, according to the plicated structure of the region, croppings of limestone would be expected to occur. Instead of limestone, massive garnet rock is found, with here and there bunches of included copper sulphides. These croppings afford a good example of areal metamorphism in contrast with local linear metamorphism following planes of fracture, or of contact.

In the case of reefs of garnet rock in Arizona, the croppings are usually rough and irregular, though preserving in the main a distinct tabular form. The garnet being much less soluble than the country rock of limestone, the croppings are usually found in bold relief above the surface, and can be readily traced.

It is usual to regard these garnet formations as the result of contact metamorphism; the alteration consisting of a combination of elements, or compounds, pre-existing in the strata of limestone, such as siliceous and aluminous layers—a condition so well exemplified by the metamorphic limestone of Sussex county, N. J., and of Essex county, N. Y., where bands of silicates and oxides shown by layers of such crystalline minerals as augite chondrodite, garnet, spinel and corundum, are common.

The conditions and phenomena of the copper garnet formations of the southwest, herein but partially set forth, indicate a somewhat different origin. They support and justify the conclusion, as regards the silica, that the formations are largely of extraneous origin, due to siliceous emanations traversing limestone, following, in general, contact planes, or planes of fracture, or fissures. These siliceous emanations supplying the silica for combination with the lime and alumina of the beds have resulted in the formation of veins and beds of garnet rock, and frequently of other silicates, especially epidote, a common associate; also of copper, in southeastern Arizona and elsewhere. The general presence of copper sulphides in these garnet reefs, together with an excess of silica, shown by the presence of quartz, gives the garnet reefs a lode-like character, the garnet becoming a true vein stone, or gangue, for the copper ore.

I am not aware that there has been any direct statement of this view of the origin of garnet rock, and of the recognition of linear reefs, or formations of garnet, as true lodes or veins which may be followed and exploited as veins of quartz are followed.

In the paper of Lindgren, before cited, reference is made to certain unpublished observations by S. F. Emmons "that garnets replace limestone at Clifton, Arizona, apparently as part of the phenomena of mineralization."

Aguilera also writes in regard to the copper deposits of Mexico: "The gangue in these contact veins is quartz; the ores are chalcocite, chalcopryite and bornite. These are generally accompanied by grossularite, iron garnet, wollastonite, tremolite and vesuvianite, all of which are products of alteration formed at the expense of the Cretaceous limestone through the agency of heated waters."

In the description of the garnet formations of the Chillagoe copper field by Geo. Smith, the garnet is regarded as intrusive and of igneous origin. After noting the absence of signs of replacement of the limestone, and describing a mass of garnet 200 feet thick, enclosed on either side by granite, Mr. Smith says: "The close association of the garnet with the limestone apparently points to an essential connection between them, yet the former rock (garnet) occurring elsewhere, and presumably without such association, has been unhesitatingly classified by eminent authorities as of igneous origin."

From an economic point of view, garnetiferous ores present some difficulties in working. The high specific gravity of garnet prevents its easy elimination by concentration processes. In smelting, the garnet forms a pasty slag, and is a worse than useless burden in the furnace. The true direction in which to work such ores appears to be by lixiviation. By crushing and roasting the copper becomes soluble, while the garnet gangue is not. It is quite probable, also, in some sections of the country at least, that the lixiviated garnet can be utilized as an abrasive.

RECENTLY a writer in the MINING AND SCIENTIFIC PRESS suggested a line of economic development in the establishment of manufactures of brass and copper articles in the immediate vicinity of the Michigan, Arizona and Montana mines that produce so much copper, arguing that such commonwealths would be more prosperous and the mine owners receive ultimately more were the men who mined the copper to make it into the manufactured requirements right where it was produced. There is something in the idea. The Selby Smelting & Lead Works of San Francisco, Cal., have for many years made shot, lead pipe, sheet lead, cartridges, etc., from a part of their lead product. The present month will see a lead pipe and sheet lead factory in operation at Trail, B. C., where the Canadian Smelting Co. propose to turn the "raw material," lead ore, into the finished product. It would be a new departure, but quite in line with industrial development to have a new Ansonia or Bridgeport transplanted from Connecticut to the Western copper mine that furnishes the metal that goes into copper ware there to complete the whole process from the ore in place to the finished copper or brass utensil.

## Economic Resources of the Northern Black Hills.

"The Economic Resources of the Northern Black Hill," is the title of an elaborate report recently published as Professional Paper No. 26 by the United States Geological Survey. The chief author of the paper is J. D. Irving, but important chapters have been written by S. F. Emmons and T. A. Jaggar, Jr. The report is in two parts, the first part, on the general geology of the northern Black Hills, being the work of Dr. Jaggar, and the second, on the mining geology of the region, that of Irving and Emmons. The entire report fills 214 pages and includes over 40 illustrations.

The area is comprised mainly within the Spearfish and Sturgis quadrangles, which were surveyed geologically in the summers of 1898 and 1899 under the direction of S. F. Emmons. These quadrangles include the major portion of the mineralized and productive territory, but as a few ore bodies that fall without its limits have been described, the title has been expanded to cover the mining region of the northern Black Hills.

Dr. Jaggar's treatment of the general geology of the district includes a discussion of its general structure, topography, drainage and stratigraphy. The intrusive porphyries are described in detail and the history of their intrusion is given. A description of the Algonkian, Cambrian, Ordovician, Carboniferous, Tertiary and Quaternary formations of the district closes the first part of the report.

In the second part of the report, which treats of the mining geology of the district, theoretical discussions are either excluded or made as brief as possible. The work is chiefly descriptive in character. The first four chapters describe, (1) the ore deposits in Algonkian rocks, (2) those in Cambrian rocks, (3) those in Carboniferous rocks, and (4) those in rocks of recent origin. A fifth chapter is devoted to detailed descriptions of particular mines in the district.

Ore deposits in rocks of Algonkian age constitute the most important as well as the most permanent factor in the mineral resources of the northern Black Hills. They include gold ores, copper ores and tin ores. Of these, only the gold ores have thus far proved important. Three mines have yielded gold ores—the Homestake mine, the Cloverleaf mine and the Columbus mine—and the greatest of these is the Homestake. The gold product of the Homestake group of mines, which covers an area over a mile long and about 2000 feet wide, has always overshadowed the combined gold output of all the other mines of the Black Hills. For a long time it constituted about 90% of the total product of the Hills. Since 1890, however, with the increasing development of the siliceous ores of the Cambrian rocks, this proportion has gradually decreased to 60%, although the actual product of the belt has steadily increased. The chief economic features of this group of mines are described in detail by Mr. Emmons, and Mr. Irving adds a petrographic study of the Homestake ores.

The descriptions of the ore deposits in the Cambrian and Carboniferous rocks and in those of the recent origin rival in interest what is said of the Homestake ores. Those who are interested in the subject may procure a copy of the report without cost on application to the Director of the United States Geological Survey, Washington, D. C.

## Chain Block Exhibit.

Herewith is illustrated the chain block exhibit of

the Yale & Towne Manufacturing Co., at Machinery Hall, block 29, World's Fair, St. Louis, Mo. They show blocks of all three types, from  $\frac{1}{4}$  to 20 tons capacity. An interesting part of the exhibit is the moving hoists. There is a new electric hoist in operation, and also one each of their triplex, duplex and differential blocks operated by electric motors to show their relative efficiency. Each block is supplied with a 1000-pound weight and so arranged that equal

power is applied to each block. The triplex block lifts its load much quicker than the others, while at the same time the ammeters show equal power applied to each block. The mechanism is automatic, so that when the triplex weight arrives at the top all three blocks reverse their motion and lower the weights until all reach the floor, when they again automatically reverse and begin to hoist. The arrangement shows at a glance the comparative efficiencies of the blocks and is of particular interest to any engineer.

## Recovery of Bullion From Zinc - Box Sludge.\*

Written by E. H. TAYLOR.

The following notes embody the development of ideas regarding the economical uses of fluxes in the smelting of zinc-box sludges. The term economical is used in this instance with reference, not only to the quantity and cost of fluxes, but also with regard to the "fineness" of the bullion produced by fusion and the "values" in the resultant slags.

Only the material contained in the first four compartments of each box is treated at a cleanup, the bulk of the gold being therein concentrated from the fact that material of all but the top compartment of each box is daily shifted upwards, fresh zinc shavings being added as required to the depleted compartments at the tail end of the box.

This procedure is the outcome of a desire to conduct a cleanup as speedily and economically as possible, consistent with securing a maximum amount of the gold and silver on hand in the boxes. The material is lifted from the boxes into tubs, while the remaining solution and any suspended sludge are transferred to a lead-lined vat of about 400 gallons capacity.

The material in the tubs is washed over a  $\frac{1}{4}$ -inch mesh screen suspended within the vat under the surface of the solution, any "short zinc" is detached and falls through the meshes, while the material remaining on the screen is returned to the top compartments.

All material being washed, the solution in the vat is syphoned off and passed through a small filter press. Hot water is run on the material in the vat, the mixture well stirred, solution syphoned off and filter-pressed, and the operation again repeated. This treatment is for the purpose of removing as much chlorides as possible, and so minimizing the production of chlorine in the after treatment with sulphuric acid, this latter containing, as it sometimes does, a small proportion of nitric acid.

The material is now removed from the vat and allowed to drain on an inclined tray, while 90% sulphuric acid is being poured into the vat in quantity sufficient to satisfy the proportion, by weight, of 1 part acid, 2 parts drained sludge. This latter is then gradually added to the acid, hot water being added also as required, and the whole well stirred until all dissolving action ceases. After a certain point in this dissolving operation is reached, a gradual addition of hot water, corresponding with the additions of drained sludge, is beneficial, inasmuch as the polarizing effect of the zinc sulphate formed by the reaction, against the dissolving power of the remaining acid on the zinc, is thereby lessened. The vat is now half filled with water, the contents well stirred and then filter-pressed, the resulting cakes of sludge washed with hot water and dried by an air blast.

These cakes are now removed, broken up and dried in covered cast-iron trays in a reverberatory furnace. This sludge contains about 30% to 60% Au. Ag. Of course the acid treatment could be pushed to such an extent as to produce sludge containing Au. Ag. = 80% or more, but this is inadvisable for following reasons:

1. More sulphuric acid must be used, and so more chlorine, due to the interaction of the sulphuric and nitric acids and chlorides, is introduced, and consequently more gold will be dissolved. This gold can, of course, be recovered from solution by precipitation on zinc shavings or charcoal, but this necessitates additional expense.

2. Much silver may be dissolved unless a proportion of zinc is left unattacked.

3. Loss in subsequent handlings increases proportionately with the value of the sludge.

Experience has shown that the best economy for subsequent operations consists in producing, by acid treatment, sludge containing 30% to 60% Au. Ag.

By using the proportions aforementioned such a result is arrived at.

The next point in the treatment is the roasting of the dried sludge, whereby are oxidized any remaining zinc, copper, lead, etc.

The degree to which oxidation of the base elements

\* Report Chamber of Mines, W. A.

of the sludge, such as zinc, copper, lead, is effected, has a decided economic bearing upon the fineness of the bullion produced in the after fusion with fluxes, inasmuch as to more completely slag off these base elements aforementioned they must be present as oxides. If present in the metallic form, then portion of the zinc and probably all the copper and lead alloy with the molten gold and silver produced during fusion, and so a bullion of inferior "fineness" is produced. The results of Table II, when compared with those of Table I, will illustrate and emphasize this point.

On the occasion of producing these bullions the material from the zinc boxes had received no acid treatment, and contained much visible "short zinc," which, in roasting, was not completely oxidized. Likewise, the slag values are increased.

The base elements may be oxidized by mixing with a proportion of niter and heating in a covered cast-iron tray in a reverberatory furnace to a temperature short of the fusing point of niter. Properly manipulated, this method produces an oxidation as near perfection as possible.

Thus, having passed the mixture through a very fine screen, and mixed it thoroughly, each particle of sludge is in contact with one or more particles of niter; and so, at the temperature of decomposition of the latter, conditions are favorable for the interaction of the nascent oxygen and the zinc, copper, lead. The material not being rabbled or in any way disturbed during this operation, there is no loss of values by dusting.

Then the introduction of niter into the roasting process provides, subsequently, as a product of its decomposition by heat, a flux, very economical in all respects for fusion purposes.

In this decomposed condition the salt is less liable to cause violent ebullition in the crucible than would niter if used as a direct flux.

As a matter of fact, a constant gentle generation of nitrous acid gas during the fusion causes sufficient ebullition in the mass to produce perfect contact and mixing of particles. This feature appears to be one of the factors whereby are secured, under the conditions of working, some very low slag "values."

Thus then the dried sludge, along with 35% by weight of sodium nitrate (the soda salt is used in preference to the potash salt as being much cheaper and equally efficient), is passed through a screen 64 meshes per square inch, mixed until of a uniform color, placed in the trays, and heated to a temperature just below the fusing point of niter for several hours. After cooling somewhat, the roasted material is mixed with such proportions of borax and sand as to secure in the resultant fusion a slag containing about 33% of "acid radical," i. e., Si O<sub>2</sub> and B<sub>2</sub> O<sub>3</sub>. This mixture begins to fuse at a comparatively low temperature, and yields a slag which, at the temperature of the wind furnace, is very thin and liquid, pours like water.

Such a condition of the slag, in conjunction with maintaining the percentage of "acid radical" at about 33%, facilitates the production of a "perfect fusion" as far as the recovery of "values" is concerned. That the percentage of acid radical present has, during fusion, a most decided bearing upon the resultant "bullion fineness" and "slag values" is very apparent from the following comparative results:

Reference Nos.	Flux Used at Roasting.	Fluxes Used at Smelting.		Bullion Produced.	"Slag" Values.		Per Cent. Acid Radical in Slag.
		Sand Per Cent.	Borax Per Cent.	Per Cent.	Base Parts Per 1000.	Silver (Ag.) Ozs. Per Ton.	
1.....	35	25	25	36.18	35.5	20.3	27.2
2.....	50	25	25		45.9	69.5	45.6
3.....	60	25	10		87.7	342.4	153.7

In the three instances, the material being treated in adjoining furnaces, the mixtures fused easily, each producing very thin slags.

The slags from fusions 1 and 2 were quite glassy looking, showing no signs of gold prills. That from fusion 3 was quite dull and solid—basic looking, in fact—and showed many gold prills distributed throughout.

Knowing that the greatest possible degree of comminution of material is required to secure in a single fusion with fluxes the complete decomposition of most materials prior to a chemical analysis, it was assumed that the degree of fineness of the sludge and fluxes would in the smelting operations prove a very material factor in determining the "fineness" of the bullion produced, and also the "slag values."

The results of Table III prove the force of this contention. At this point the comparatively lower slag "values" produced in the smelting of the higher grade sludge suggested the desirability of, in after experiments, increasing the proportion of fluxes relatively to the percentage of "base" contained in the sludge.

At first, being doubtful as to the action of any undecomposed niter on the salamander crucibles, only about 10% was used for roasting, along with a proportion of sand, but, as no undue "eating" of the

crucibles occurred, the niter was afterwards gradually increased, until finally 35% and no sand was used, the latter being added, however, after roasting, as a flux for smelting.

The sand and borax in proportions, as used at present, of 25% and 35%, respectively, along with the roasted sludge, are now passed through a sieve 300 meshes per square inch, and all mixed together until a uniform color is attained, transferred to the crucible in wind furnace, smelted to tranquil fusion, and then immediately poured.

During this smelting operation a cover placed over the crucible prevents loss of values by dusting and spurning, and also prevents coke particles and dust from falling into the mixture.

In this latter case the coke, of course, would reduce zinc, and so lower the grade of the bullion.

The buttons of gold resulting from the smelting operation are melted down with enough borax and sand to form, when fused, a cover for the bullion, and without any refining whatsoever poured into a mould. A sample for assay purposes is taken during the operation of pouring, about half way through. As soon as the gold in the mould is solid the still liquid slag is run off, the bar scraped, dipped in nitric acid, and then scrubbed and washed with salt and water.

By following the above outlined treatment, bullion is produced rarely containing more than 30 parts of base per 1000 parts.

The slag, without further treatment, is sampled twice independently, and assays of each sample made in triplicate. Assay results, as shown in tables, are thus the mean of six assays.

One attempt to use a minimum amount of flux in smelting yielded a slag assaying 291.85 ounces of fine gold per ton, a small portion of the values existing as metallics (see 1, Table I). The proportion of flux: "base" in sludge equaled 1 : 1, enough "acid radical" being present to insure 30% for the resultant slag. The smelting mixture fused only at a comparatively high temperature, yielding a thick viscous slag.

At this point it may be mentioned that it is not advantageous to increase the percentage of niter and correspondingly reduce the percentage of borax, as compared with the amounts used at present.

If this be done, unless an increased proportion of sand is added, then the mixture is too "basic," and fowl slag and bullion are the results. See previous table.

If sand be added in sufficient quantity to maintain the "acid radical" in the resultant slag at 33%, even then the result obtained is high "slag values" as the percentage of borax is decreased.

(TO BE CONTINUED.)

## THE PROSPECTOR.

The similarity in the physical appearance of various minerals is very confusing to the average prospector, and although a knowledge of mineralogy is indispensable to the best results, a little knowledge of the science often misleads the beginner and some amusing situations result. Selenite, the common calcium sulphate, is frequently mistaken for mica, which it greatly resembles. Azurite, the blue carbonate of copper; linarite, a basic sulphate of lead and copper, and vivianite, a hydrous-ferrous phosphate, each look sufficiently alike to deceive the inexperienced, and either is usually taken for the first. Mariposite, a chromium mica, has often been mistaken for malachite, the green copper carbonate, and so also have many other minerals.

The mineral from Sumerduck, Va., is ilmenite, or menaccanite, a titanite iron ore. It is slightly magnetic.

The shaly rocks from Greater-ville, Ariz., are not "oil shale," but a shaly or slaty rock containing iron and black oxide of manganese.

The fossils from southeastern Idaho have been determined by F. M. Anderson to be No. 1 corbula perundata, M. and H. Judith river Gr., of the Laramie epoch; and No. 2, cyprina and maetra, presumably also of the Laramie epoch. The existence of coal in these beds is also an indication of their age—the Laramie, or lower member of the Cretaceous.

The mineral specimens from Princeton, B. C., are: No. 1, a yellow powder, alumina, silica and iron oxide, no vanadium nor uranium; No. 2, shaly rhyolite tuff.

The rocks from French Gulch, Shasta county, Cal., are: No. 1 is a metamorphic rock (quartzite) heavily impregnated with iron sulphide; No. 2 is vein quartz, containing iron sulphide and probably gold; No. 3 is

metamorphic argillaceous rock, probably altered shale, and containing native copper in thin films like gold leaf; No. 4 is also a metamorphic rock of argillaceous character in which there has been a development of calcium carbonate; No. 5 is a lens of quartz containing a large amount of iron sulphide, and is probably gold bearing; No. 6 is similar to No. 4, but contains a large amount of iron sulphide.

The rocks from Bisbee, Ariz., are: No. 1, composed chiefly of an aggregate of crystals of calcium sulphate (gypsum), with iron oxide; No. 2, sandstone made up of rounded quartz grains in cement of iron oxide and calcium carbonate.

The mineral specimen from Gold Hill, Or., is infusorial earth, largely composed of silica. It resembles some clays, but is much lighter and has different properties from clay. It is difficult to tell the two apart often without microscopic examination. With the aid of the latter under high powers the diatoms may usually be generally seen. Scrape off a small quantity of the material and place on a glass with a drop of water.

## Advertising and Export Business.

During the summer of 1901, the writer of this, on a business trip to Europe, landed in Cuxhaven, which is the first landing port of the Hamburg-American Line steamers bound for Hamburg. The wharves and railway station in Cuxhaven, since then, have been rebuilt, but at that time the landing wharf was connected with the old railway station by a long covered passage. The station end of this passage was a blank wall, the entire surface of which was entirely covered with the—on this side—well-known advertisement of "Quaker Oats."

This particular advertisement, in the writer's opinion, had a better position than any other advertisement which he has ever seen, as it was bound to make a lasting impression on the thousands of men, women and children whose minds and eyes had been relieved from looking at any and all kinds of advertisements for the period of an ocean voyage.

The European traveler will find familiar signs advertising American specialties not only in every large city, but in many out-of-the-way corners, and these specialties which are advertised extensively cannot help but do a profitable business, as the mind of the average European responds readily to good advertising.

In England, especially, a number of well-located signs advertising Lord's boiler compounds can be seen. The manufacturers of these compounds, while they have numerous agencies established on the continent, have made a special effort during the past few years to gain a strong foothold for business in all English-speaking countries. In England and Scotland, several agencies have been established, and, while the undertaking has been expensive, the volume of business secured has been sufficient to prove the undertaking to be a profitable one.

A business once established in England will, naturally, extend to its colonies, and the Geo. W. Lord Co., manufacturers of Lord's boiler compounds, found it advisable to open offices in Australia as well as Madras, India. A great deal of advertising is done by each of these branch offices, a sample of which reached us from Madras, India, recently.

This particular advertisement was designed to be sent out by mail. The scene represents a photo-

Transportation at Madras, India.

graph of a large shipment of Lord's boiler compounds arriving in Madras and being transported from the wharf to warehouses. Particular attention is called to the mode of transportation, which is peculiar to the Madras presidency. It appears that each two-wheeled cart is handled by three men, two of them managing the front end of the vehicle while one of them pushes on behind, usually with his head.

The mere fact that a specialty like boiler compound can establish a profitable business in foreign lands should be proof to the average American manufacturer that the world can be made his market.

V. O. LAWRENCE.

## Mining and Metallurgical Patents.

PATENTS ISSUED JULY 19, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

STEAM SHOVEL.—No. 764,600; G. W. King, Marion, Ohio.

Combination, with dipper and guiding sheaves, of hoisting drum having aperture through its body near each end of face thereof, and grooved bridge or saddle arranged longitudinally of drum within interior thereof between apertures, and double hoisting cable, two leads whereof connect dipper and drum, cable passing through apertures and having its connecting portion arranged in grooved saddle or bridge and adapted to slide therein.

APPARATUS FOR OPENING OR CLOSING MINE DOORS.—No. 765,282; F. Hutter, Clealum, Wash.

The combination of supplemental rails, rocker shafts each provided with two crank arms, one crank arm of each shaft being pivotally connected to rails, connections between other arms, door, tiltable frame having one end hinged to framework of door and other end projecting beneath lower edge of door, pivoted lever having hinged connection to tiltable frame between hinged end and end operating door and means for connecting pivoted lever to rocker shafts and rails.

CONDUIT.—No. 765,631; J. D. McNab, Fillmore, Cal.

Flumes having frame A and side walls B and bot-

tom C secured to frames; paper lining D secured to inner side of side walls and bottom; lining having applied thereto coating of hot asphaltum.

PICK.—No. 765,642; G. Tippet, Whatcheer, Iowa.

Combination of blade having plurality of stationary projections extending at right angles therefrom on inner face thereof, and plurality of seats between projections, handle head, top of which is adapted to fit against blade between projections, having studs to enter seats and lateral flanges provided with up-turned lips at ends extending short of top of head and adapted to receive projections, latter having open ended slots, and screws tapped into head and fitted into slots.

MINING MACHINE.—No. 765,317; F. M. Lechner, Allegheny, Pa.

In mining machine, combination of frame, cutting chain operative thereon having links formed with grooved outer faces, and guides on frame extending into link grooves.

REFINING FURNACE.—765,323; R. Robinson, Pittsburgh, Pa.

Furnace for refining iron and steel, combination with melting chamber, series of flues arranged at each end of melting chamber within body of furnace, central one of flues being in communication with draft stacks for carrying out waste gases, and pair of flues arranged one at either side of central flue in each of these series of flues adapted to introduce flame to melting chamber, standpipes having controlling valves therein arranged exteriorly and adjacent to

melting chamber, nozzle-forming extensions formed on pipes and converging toward common point within chamber, extensions being provided with twyers for introducing draft into melting chamber.

PROCESS OF NICKEL PLATING.—No. 765,371; J. W. Aylsworth, East Orange, N. J.

Process of electroplating strip-like article or connected series of separate articles, which consists in continuously passing article or articles through heating chamber in presence of reducing gas to deoxidize article or articles, in continuously progressing article or articles through plating bath and simultaneously electroplating metal thereon in transit.

VALVE MECHANISM FOR AIR COMPRESSORS OR THE LIKE.—No. 765,359; A. W. Daw and Z. W. Daw, London, England.

Combination of compression cylinder, delivery valve opening outward therefrom and having its rear face exposed to pressure in receiver, cylinder open at inner end to pressure in receiver, spindle provided with piston on its inner end adapted to work in cylinder, means connecting piston with valve, spring for closing valve, second piston mounted on spindle, cylinder in which last-mentioned piston works, valve governing supply and exhaust of cylinder for second piston, pipe leading from receiver to valve chest of governing valve, and means controlled by governing valve for buffering stroke of second piston.

PROCESS OF MAKING SULPHURIC ACID.—No. 765,520; A. L. Stinville, Paris, France.

Process for manufacture of sulphuric acid in lead chambers which consists in causing to circulate in dishes of chambers acid having density of 3° to 5° Baume below density of acid produced on vertical sides, and having temperature of 15° to 20° centigrade lower than temperature of gases in chambers.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

A gold quartz strike is reported made by the Treadwell M. Co. on Kensington ledge at Berners bay, near Juneau. This property is under bond to Superintendent J. McDonald and F. W. Bradley, consulting engineer of the Treadwell mines. After bonding the property two months ago they started a crosscut tunnel 800 feet below the lower surface workings, which were 100 feet deep. They struck the Kensington ledge within 20 feet of its expected location from the surveys.

T. W. Murphy and A. L. Davis of Spokane, Wash., have bought placer claims on the north side of Copper river, 90 miles east of Valdez, and will locate additional placer ground adjoining the two claims. Davis et al. of Spokane own coal lands in Alaska which will be developed. At their placer holdings, after the ground adjoining the two claims is located, they will arrange for starting work. It is intended to take in machinery this fall, while the snow is on the ground. The one drawback to the placer ground is the lack of transportation, says Davis. The coal lands are 20 miles east of Kayak, near the Finch & Campbell coal mines. Part are on the oil seepages.

Fairbanks reports say there are more than 3000 men along the Tanana river and many of them are not working. It is no place for laboring men as yet, because the mines have not been sufficiently developed to permit of the employment of workmen. The country has been staked in all directions for miles. There are enough stores to supply ordinary wants. These conditions will continue until the mines are somewhat developed, giving the miners an income to work their properties and employ more men.

Valdez reports say W. A. Clark of Butte, Montana, has bonded twenty-eight copper claims on Latoche island, Prince William sound. The conditions are that \$70,000 shall be expended this year for development work, to be started at once.

## ARIZONA.

### Cochise County.

Superintendent C. T. Bricker says operations will be resumed in the Old Terrible mine and mill in the Dragoon mountains, near Pearce. The mine has been closed for three months; and there is a 20-stamp mill. The ore carries gold and silver.

### Gila County.

Work is progressing at the works of the Old Dominion C. M. & S. Co. at Globe, and a large number of mechanics are employed. At the new smelter construction work is being rushed, but it will be a month yet before the plant is ready to operate. The three furnaces are finished and the blast and converter pipes, 5 and 2 feet in diameter respectively, and about 250 feet in length, have been put up. The converter hoods are in place, the electric crane being used to move the heavy pieces. The brick work of the dust chamber is almost finished, and the construction of the ore bins, on the hill above the smelter, is progressing; also the trestle leading from the ore bins to the feed floor of the smelter, over which electric motors will haul the ore. The bins, nine in number, will have a capacity of 1000 tons of ore. Grading for the concentrator is finished, and for the machine shop is well under way. At the new shaft an oil sump is being constructed. This is a concrete basin that will hold a car of oil and will facilitate emptying of oil cars. From the sump the oil will run by gravity into the storage tanks. Work is being done on the railroad between the smelter and mine, changing tracks and improving the grade. The company is operating all three of the old furnaces, says Smelter Superintendent Shelby, having blown in the third furnace last week.

In the San Carlos mining strip, above Dudleyville, the Saddle Mountain M. Co., of which G. B. Chittenden is manager, is opening up its properties. Low-grade ore running 4% in copper has been blocked out, and wherever shafts have been sunk below the water level black sulphide has been cut, going 12% copper, says Manager Chittenden. The company has been working twenty men, which will be increased. The Saddle Mountain Co. is also prospecting its claims in Deer Creek coal fields with a diamond drill. The drill has reached depth of 500 feet.

### Graham County.

G. T. Millner, manager of the Weaver mines, near Morenci, says he is shipping ore. He expects to put in a hand jig at the mines which will concentrate three tons into one and thus not only make a

higher product, but also save money in transportation and treatment charges.

### Maricopa County.

Wickenburg reports say a strike of free gold ore has been made on the Pittsburg group, 10 miles east of Wickenburg, by G. White, part owner.

### Mohave County.

S. C. Bagg, superintendent of the New Comstock mines near Kingman, says he has teams hauling ore from the Katherine and Sheeptrail mines to the mill. He reports that at the Katherine he has opened up a streak of ore that averages \$9 per ton. A discovery has been made on the Sheeptrail of another vein 2 feet in width that carries values. Specimens from this vein show free gold and horn silver.

The Swiss-American M. Co. in San Francisco district, near Acme, is putting up buildings for the new hoist, which will be placed on the Ben Doran mine. The ore shows free gold.

D. Slocum of Monrovia, who has properties on Silver creek, is taking in supplies and machinery, via Needles, Cal., to the mine over the Mohave & Milltown Railway and by wagon from Vivian station. The new road built from Vivian camp to the Silver creek country has added to the freight traffic from Needles. It is expected the Mohave & Milltown Railway will later continue the track from present terminus to Silver creek, near Slocum properties, and thence up the creek to the Gold Road camp, near Acme.

### Pinal County.

The Florence Blade reports a body of wulfenite has been struck in the '91 claim of the Troy-Manhattan C. M. Co. at Troy. Wulfenite is a molybdate of lead. The Troy-Manhattan C. M. Co. is said to have obtained a market for its product and is preparing to put in a complete concentrating plant. The '91 mine is operated through the Davis shaft, and Manager C. H. Cutting is setting up a steam hoisting plant at the Davis shaft preparatory to mining the wulfenite on a commercial scale. The concentrating machinery will be shipped in on the Phoenix & Eastern, as the track of the latter has reached Kelvin, 6 miles from Troy.

### Yavapai County.

President Miller of the Lion G. M. Co. says Superintendent M. Bradley is starting up work on the company's properties at Cherry Creek.

The Gold Bullion M. Co. has been organized in Prescott, by R. H. Miller, J. Hollingshead, J. A. Newman, G. N. McCullough and J. K. Oney to work mineral properties in the Hillside section, near Sultan.

## ARKANSAS.

### Boone County.

Superintendent Sandstrom, of the Susquehanna mine, is shipping concentrates from the mine at Harrison.—C. I. Page et al. of Rochester, N. Y., are reported buying a group of zinc and lead holdings, near Harrison.

The Harrison Times says five concentrating mills have been erected and commenced operations so far this year, and in each case the property is yielding a profitable output. In several instances it will be necessary to wait for completion of railroad lines already building before full operations are continuous.

## CALIFORNIA.

### Calaveras County.

(Special Correspondence).—Considerable new work is in progress in the vicinity of Angels. All of the old mines are in operation and the newer ones are being developed with encouraging results. The discovery that the ore bodies occur beneath the so-called "talc foot wall" is having an important effect on the development of mines all along the line in Angels. Many were at first skeptical of the finding of ore below the talc, but there are few who doubt it now. In the Smiths Flat section, west and northwest of Angels, some new development is reported. At the Demarest mine, near Fourth Crossing, work is to be resumed after an idleness of two or more years. The shaft is down over 700 feet. In the upper levels a good shoot of ore was worked over thirty years ago, but the recent development has been less fortunate. The formation is greenstone, and the distribution of ore shoots is erratic. At the Gwin mine the new shoot of ore discovered several months ago is being proven. A winze is being sunk in it below the 1700 level. It is known to be 150 feet high, but its depth still remains undetermined. This shoot is from 1 to 2½ feet wide, and the rock is said to average \$40 per ton; some handsome specimens have been found. The main shaft will be carried deeper and the new shoot opened more extensively. About Mokelumne Hill considerable prospecting both in gravel and in quartz is in

progress. The indications are that the early miners left numerous remnants of good gravel in the ancient river beds, owing to the fact that the deposits were not continuous, but were often found "cut out" by streams of more recent date. Some of these remnants, though not extensive, are rich. In the section north and south of Murphys prospecting and mining on the high-grade ores of that section is in progress as usual each summer, with the finding of some rich ore. Some of these undertakings are well organized, but most of them are small and are in the hands of men working singly or in pairs. Some good reports come from the region east of West Point in the Blue Mountain section. The ores there contain more silver and base metals than is usually found in the veins further west. Arsenic, in the form of mispickel, is one of the common occurrences in the Blue Mountain district. Some of the mispickel is said to be rich in gold. Capital has not yet entered this region, though there are some good opportunities in the eastern part of this county.

San Andreas, July 26.

The Demarest mine, near Fourth Crossing, on the road between San Andreas to Copperopolis, started up last week after being shut down for two years. The company has been reorganized and more machinery has been put in. The first work to be done will be unwatering the mine and retimbering the shaft. The shaft will then be sunk from the 200-foot point to 400 feet.

The Mokelumne & Campo Seco C. & M. Co. is putting in 2000 feet of iron pipe 22 inches in diameter, near Mokelumne Hill. The company has several thousand feet of pipe at various points along the line of the canal which has been in use for a number of years, and will now be taken up, repaired and tarred and relaid, as most of it is still good, says the Chronicle. The new pipe will be used temporarily while repair work is being done.

The Fannie Marie G. M. Co. has deeded to H. B. Chandler et al. the Jones quartz mine in Glencoe district, the Fannie Marie placer mine in same district, the Blue Jay quartz mine and Summit quartz mine in Fishers district, in trust, to carry out plan of reorganization. Chandler in turn has deeded the property to the Hesperus M. & M. Co.

The Utica G. M. Co.'s group, embracing the Stickle, South Stickle, Gold Cliff and Madison mines, at Angels, are all in full operation. At the Stickle mill work is progressing on construction of the additional forty stamps, which will make the Stickle mill 100-stamp capacity.—The Angels mine is running full handed and its 40-stamp mill is crushing steadily. Its milling capacity, it is reported, will be increased to eighty stamps, and other improvements made in and about the property to facilitate mining and reduction of its ores. J. V. Coleman is principal owner.

At the Black Oak mine near Hawkeye, near Angels, sinking is going on. The shaft is down 275 feet and from this crosscuts have been run cutting several veins, all of which are said to carry free gold and sulphurets. This property is 1½ miles from Angels.—The Maltman G. M. Co., of Angels camp, has consolidated with the Black Oak M. Co., says the Mountain Echo. Work will be resumed in the Maltman mine.

The Melones mine at Melones is turning out its regular supply of ore and keeping its 60-stamp mill running steadily.—The Metropolitan G. M. Co., having the Allison and Carson Creek mines, near Irvine, is keeping the water down to the 200-foot level in the Carson Creek (Jones) shaft, awaiting orders of the management.

At the Independence gravel mine, near Angels, the work of running the bedrock drift to tap the channel is progressing.—Everything is running satisfactorily at the Sultana mine at Angels and the mill is in steady operation. Milling facilities will be increased.

The Nellie mine, near Marble Spring, south of Angels, is under bond to the Edna M. Co., which will begin developments next week.—Work is going on in the Spring Gulch mine at Albany Flat, south of Angels. A crosscut is being run from the 100-foot level to reach the lode. W. V. Miller is superintendent.—At the Ultimo mine, near Albany Flat, the water is being kept from the mine pending resumption of work next week.—At the Lightner mine and mill operations continue steadily.

### Mariposa County.

The work on the pipe line to carry water from the spring near the Half Way house to the mill of the Princeton mine at Mt. Bullion is progressing satisfactorily, says Manager C. C. Derby.

### Mono County.

The Crystal Lake G. M. Co., at Lundy, started dropping twenty stamps last week.

### Nevada County.

The success of the canvas plant at the Mountaineer mine, Nevada City, has shown that much of the tailings contain slimes which are profitable to work, says Superintendent J. C. Campbell. He will add another plant, which will be operated in tandem with the present one.

The Union Con. G. & S. Co., N. J. Weber president and G. A. Nihell superintendent, is developing the Union mine at Banner hill, near Nevada City. The drain tunnel has been cleaned out to the shaft, which is tapped at a depth of 100 feet. The incline was found in good condition and will be retimbered to the surface. Hoisting and pumping machinery will be placed, after which the mine will be pumped dry and further opened up.

W. Wilson, superintendent of El Oro mine at Maybert, says the mine has been unwatered to the 400-foot level and is being drained toward the 500-foot level. When that point has been reached the bulk of the water in the mine will have been pumped out. The shaft of the Yuba has a depth of 600 feet on the ledge, which defects but little from the vertical, and as soon as the mine is entirely unwatered sinking on the shaft will be resumed. At least that is the present intention of the company which now has the El Oro in hand. The plan of further development includes drifting on the lower level and prospecting the ledge. The El Oro (formerly the Yuba) has a mill of fifteen stamps.

The Idaho-Maryland mine, at Grass Valley, is again assuming activity. Everything about the mill and hoist is being overhauled. Last week the water was turned on the 14-inch Cornish plunger pump and the machinery started up without a hitch, though flooded for two years. This pump insures the unwatering of the mine to the 1000-foot level, and it is said will not need the assistance of the 12-inch pump in the main hoist building. Men are at work laying the foundation for the 40-foot truss to which the shaft timbers are to be hung. L. V. Dorsey, when the mine was closed down, left everything in good condition, such as repacking pumps and repairing the shaft, without which precaution reopening the mine would have been difficult. The pipe line which furnishes power for the Idaho-Maryland mine and mill is being inspected, and bands of iron are being prepared to strengthen the points where a leak appears. All the water-ways leading from the several Pelton wheels which furnish power are being replaced by flumes built of first-growth spruce lumber. Several labor-saving devices have also been added to the machine shops and engineering department. The approaches leading to the mill and mine, such as roadways and bridges, have been overhauled and repaired.

### Plumas County.

W. V. Somerville, superintendent of the Midgemoola G. M. Co. of San Francisco, operating on an extension of the Malloy quartz location on Butte creek, near Quincy, says they are running a tunnel to tap the ledge running through the Malloy mine.

### San Diego County.

The mill of the California King M. Co. at Picacho is hung up, pending repairs. Last week the governor belt broke or was thrown off, removing the check on the flywheel, which weighed twenty-one tons, and the flywheel went to pieces.

### Shasta County.

At Delta, the California Advance M. & M. Co. has begun operations toward further development of its quartz mines on Dog creek, several miles west of Redding. J. T. Cooney, local manager, has put on eighteen men. He expects to have three full shifts in the several drifts. Cooney relocated the Gainey ledge, Nos. 1, 2, 3 and 4, under the title of the Main Strike, Belvedere, Oak and Mountain claims.

The Bully Hill M. & S. Co. reports over 300 men at work in the company's mines and smelter at De Lamar (Winthrop P. O.).

### Sierra County.

J. S. Herron of Reno, Nev., manager of the New Enterprise mine, near Downieville, of which J. Sparks of Reno, Nev., is principal owner, is putting on men and will run several hundred feet of tunnel. Three hundred feet were run last year. It is expected they will tap a gravel channel which is supposed to form a part of the mine, which was formerly the Rattlesnake mine. It is on the North Fork of the North Fork of the Yuba river.

The material for the Keystone 10-stamp quartz mill at Sierra City is being delivered and construction work started near the mouth of the tunnel.

### Slacklough County.

B. F. Bassford of Etna reports taking out gold-bearing quartz from a ledge on

Taylor creek, west of Etna, and a mill test is being made. The ore shows free gold. The owners have formed the Taylor Lake M. Co. and are arranging to place a mill on the mine. They have abundant water power at hand.

Harris Bros. of Etna, operating at their mine at Taylor creek on Salmon mountain, between Etna and Sawyer's Bar, report from 595 pounds quartz they realized \$4000, and most of the quartz taken out runs \$200 a ton. They are running a 1-stamp mill. The ledge is 6 feet in width. They have bought the 2-stamp U. S. Grant mill at the Meyers ranch on Yreka Flats, to be moved over to the mine. The Red Ant mine at Humburg, adjoining the Punch Creek mine, owned by A. Rosborough and Churchill Bros., will be developed. Men are being put to work. W. M. Ridenhour has put up a steam engine for running the pump and hoist at the Mono mine on Humburg, the water supply being too light at present for keeping the shaft clear of water. Machinery has been received at the Morrison & Carlock quartz mine in Quartz valley, near Fort Jones.

#### Tuolumne County.

The Alexandra, Little Blue, Happy Hooligan, Josephine, Swiss and Victor claims, between the North Fork and main Tuolumne rivers, near their junction, and near the Mohican mine, near Groveland, have been sold for \$60,000 to J. J. Smith, E. H. Cary, E. Cowperthwaite and L. M. Cutting, W. C. Stanley retaining an interest. The transfer also includes a four-fifths interest in a bond on the Marguerite quartz mine and a four-fifths interest in a bond on the Josiah and Venezuela quartz mines.

The Republican M. & D. Co. has bought the Campbell interests in the Orcutt quartz mine, near Jacksonville, and adjoining the Republican mine on the north. The transfer also includes 149.63 acres of land in the vicinity.

T. A. Piper of San Jose has bought for the Beehive G. M. Co. the Buckeye placer mine on Table mountain, west of Shaw's Flat, near Sonora, also certain mining rights in section 27, in the same vicinity, for \$20,000.

The strike of the union miners at the Jumper and Golden Rule mines at Stent, due to the "strip to the skin" order, has been declared off and work resumed on the "open shop" policy. Manager M. B. Kerr posted a notice including: "For the present and until further notice, as nothing but development work will be carried on, the order as to stripping is modified," so that the watchman at the change house will search each man "around his undershirt in such a manner as seems necessary." In the mill forty stamps are dropping.

The Jerome Canyon C. Co. of Arizona has bought the Badger quartz mine, 5 miles west of Jamestown and near Bear creek, for \$12,000. The company is to pay 20% of the products from working the mine, which is to apply on the purchase price.

A 110-light dynamo will be put in at the Draper mine, near Soulsbyville, to light the surface works.

The Mono M., M. & P. Co. has been incorporated by J. J. Smith, C. H. Cutting, E. H. Cary, E. Cowperthwaite and W. C. Stanley. J. J. Smith is president and W. C. Stanley manager, with principal place of business at Stockton. The company has bought the Gianelli group of six mines and the Marguerite mine. It also holds a bond on the Venezuela and Josiah mines. It is intended to extend the wagon road from the Baker ranch, near Carters, to the mines near junction of North Fork of Tuolumne river with the main Tuolumne river, and to build a dam across the North Fork and about 1000 feet of flume. With the water power thus obtained, the company will operate the mines with air drills, etc. A mill of ten stamps will go in when the road is built. Manager Stanley has started operations by putting men to work on the mines and the survey of the road.

The New Era reports a mining deal under way for combining the Providence, Starr King, Consuela, Bonita and Garfield mines, near Carters. W. W. Coe of Boston, Mass., is at the head of the deal. He has the Bonita, Garfield and Starr King properties under his control. An electric power plant on the North Fork is said to be included in the plans.

#### COLORADO.

(Special Correspondence).—It is announced that in a few days Governor Peabody will declare martial law at an end in the Cripple Creek district. The strike has never been declared off by the Western Federation of Miners.

Over \$7000 has been subscribed by the citizens throughout the State for the men crippled and for families of those killed by the dynamite outrage at Independence. A benefit picnic will be given at Cameron

in Cripple Creek district on August 1, to increase this fund.

The placer mines of the State report a good season up to date. So far the water supply has been ample, and it is believed the placers that have been obliged to close down early in the season heretofore will be able to run until cold weather sets in, so far as water supply is concerned. The water supply for many of the placers is obtained close to the source of supply, which makes the supply uncertain after the snow commences to melt and especially at this season of the year.

It is reported that the Colorado & Southern railroad has bought the Gilpin County tramway and that the same will be improved. This tramway circles the district of Central City, Black Hawk, Nevada, Russell Gulch and other portions of Gilpin county, hauling ore from the different mines to the mills at Black Hawk.

Denver, July 25.

#### Boulder County.

(Special Correspondence).—The Cold Spring M. & T. Co. is overhauling its mill and putting in new concentrating tables and jigs.

Gold Hill, July 25.

(Special Correspondence).—G. A. Kennedy is preparing to operate his claims on an extensive plan, 3½ miles from Boulder. He will build a mill for treatment of his ore at the mine.

Boulder, July 25.

(Special Correspondence).—J. G. Boundy, manager of the Burlington & Boulder M. & M. Co., intends putting up a plant to handle the output from their mine. This property is in the Gold Hill district and the outlook is reported promising.

Rowena, July 25.

(Special Correspondence).—The Fluorite M. Co. have opened up a body of lead and gold ore which runs \$33 per ton. This body of ore was struck 18 feet from the surface. They were sinking a vertical shaft to develop the claims when the ore was cut. It is 4 feet wide in the shaft. They will continue sinking the shaft and will put on a hoisting engine to facilitate the work. The company controls seven patented claims, and is owned by H. D. Milton, T. Phillips and M. Fitzgerald. The assays show up to 65% lead and three ounces gold.

Jamestown, July 25.

#### Chaffee County.

The Mount Antero M. Co. has been organized with main office at St. Paul, Minn. J. B. Dow is president, and T. O. Peacock of Cheyenne manager and superintendent. They have ten claims on north slope of Mount Antero and a mill site and placer property on Chalk creek, near Buena Vista. The property is developed by two tunnels, 40 and 80 feet respectively, on Copper Rock No. 1 and No. 2 lodes. While the vein carries values in gold and copper, it will be worked principally for molybdenum.

Machinery has arrived at Salida for the proposed leaching plant and thirty men are putting it in place. The building has been sold to the American C. M. & R. Co., of which A. Reynolds of Denver is president. B. Ross is vice-president and manager. A 90 H. P. boiler and a 60 H. P. engine are being set up and will be in running order by August 15. A No. 3 Gates crusher, capable of crushing thirty tons of ore per hour, and one set of rolls are ready for operation. The leaching tanks are being set up and the plant is expected to be running at full capacity next month.

#### Clear Creek County.

Georgetown reports say the management of St. Paul M. Co. is raising a working capital to develop its mining claims. W. L. Smith, of Osage, Kan., is interested. It will further open up the upper workings of the Little Jack and other claims, and also drive a tunnel to cut the veins several hundred feet below the present lowest workings.

J. B. Alliaude, of Denver, manager of the Specht mill at Dumont, reports he has a lease on the Live Yankee dump and he is treating the ore with satisfactory results. It is estimated there are 300 tons of concentrating material which can be handled. The Specht mill has been overhauled. The dump matter is hauled from Dumont to the mill at a cost of 65 cents per ton and after computing all costs of treating the same it is said a saving of \$7 per ton is the result. Only ore from the surface of the dump has been treated as yet.

Coal and other supplies have been taken in to the Stevens mine, near Silver Plume, and ore and lead concentrates are being shipped. It has been decided to increase the capacity of the mill by adding two more jigs, three now being in operation, and the mill building is being enlarged for that purpose.—It is reported work will be resumed on the Vice President

group near the Seven-Thirty property on Sherman and Brown mountains, near Georgetown. The Vice President was closed through litigation.

B. Boyer has a bond and lease on the Keystone group of claims on Leavenworth mountain, near Georgetown. As the mine has been idle for some time, a number of caves had occurred and it was necessary to retimber. The property is developed by the tunnel system.

#### Dolores County.

The work of reopening the Sydney group of mines, near Rico, through a shaft, started last week, under Superintendent J. W. Winkfield, is progressing. The shaft is in the upper contact formation and low-grade carbonate ore is being opened.—F. A. McNeill et al., owners of C. H. C. group of gold claims, in Mt. Wilson district, near Rico, are starting operations.—The Wellington group of mines, on C. H. C. hill, is keeping teams busy hauling ore from the mine to Winkfield spur, where it is loaded into the cars and shipped to the Durango smelter. Both the Habermann and Worthing blocks are shipping. The ore is an oxide of iron mixed with lead carbonates and carrying values in silver.—The water in the Argentine shaft is being pumped out, and the drifts are rapidly being freed from water.

F. Wakeman of Denver has started work of reopening the Princeton mine, on C. H. C. hill, near Rico. Owing to the mine having lain idle for a number of years and all of the track being removed from the main working tunnel, it will require some time to retimber and place new track in the tunnel. Wakeman intends driving the tunnel ahead into the mountain from where the drifts in to Ethlena and Crebec properties were made and will not follow the old tunnel, which was run on the course of a fissure.

The Beidler group of mines at the mouth of Horse gulch, near Rico, consisting of twelve claims, will be operated again, and the work of reopening the tunnel which enters Sambo hill from the northeast was started last week. This group is owned by W. F. Hall, W. G. Weaver, G. Beidler and G. E. Moore, but is under option to Rico men. T. R. Thompson, superintendent of the Intrinsic G. M. & M. Co., will superintend operations on the Beidler group.

#### Fremont County.

A copper strike is reported made in Muddy creek, 25 miles southeast of Florence, by J. Miller. The vein is 2 feet in width and has several streaks of copper ore that run 20%.

#### Gilpin County.

The Mountz mill on Pine creek, near Rollinsville, is running steadily. It is a mile from Apex. Two additional tables are being put in, and as soon as possible the 10-stamp capacity will be doubled. C. S. Palmer, of Kansas City, Mo., is interested. L. J. Mountz is manager.

Negotiations are under way for starting up the Pyrenees group on Quartz hill, near Central City, by Eastern parties. L. E. Tobias of Idaho Springs, manager of the Golden Cloud mine in Russell district, is manager. He is putting machinery at the Nimrod mine, adjoining the Pyrenees on the east, and the water is being hoisted. This shaft is down 560 feet. When the water is out an examination will be made to determine future operations.

Traffic Manager Wellington of the Colorado & Southern Railroad has announced that the freight rate has been lowered to 75 cents per ton on ore and concentrates which are valued under \$9 per ton, and a rate of \$1 per ton on all ores and concentrates which are valued at more than \$9 and under \$20 per ton. The old rate from Black Hawk and Idaho Springs to Denver on all ores and concentrates of a net value up to \$10 per ton has been \$1 per ton, and on the grades carrying net values of from \$10 to \$30 per ton the rate was \$1.50 per ton.

Eastern men are interested in the East Boston mine, near Central City, and they are intending to put in a sinking and stationary pump to unwater the lower workings after which they expect to start sinking. The main shaft is down 550 feet and it will be sunk another 100 feet. The company will also put in a boiler of 80 H. P. capacity. Operations are at present being confined to the 200 and 400 levels, stopping being carried on in the 200-foot level, while in the 400-foot level a winze is being sunk in ore and the west level is being extended. Regular shipments are being made of milling ores. The operations are under Superintendent W. Job.

J. Powers et al. of Black Hawk have a lease on the Caledonia 20-stamp mill at Wide Awake, near Rollinsville, and they are overhauling same and getting it in shape to handle the ores of the Stewart mine.

#### Gunnison County.

The Gold Links and Demurrers group

of sixteen patented claims in the gold belt near Pitkin, being secured by the Colorado S. & M. Co., will be worked in connection with other holdings of the company in the district under the management of J. F. Pearson, who says that as soon as machinery can be placed on the property development work will be started. Men are at work overhauling the machinery. Two shifts will be put on and two drills used in the breast of the crosscut tunnel. An electric light plant will also be put in. Work on the company's property in Hall's gulch continues and the north tunnel is getting near the contact.

#### Lake County.

Manager Pogue of Richmond, Ind., of the Russia mine on Mount Lincoln, near the Moose mine, near Leadville, has started work on the mine. Men have been put to work and the plan is to carry on extensive development.

The zinc interests of the Leadville district are improving. The tonnage of zinc from the camp this month will exceed 8000 tons, an increase over last month. The zinc is being taken principally from the Moyer and the Western mines, although there are several smaller producers which are sending out a considerable tonnage.

#### Park County.

(Special Correspondence).—The Ling-Star M. Co. is operating the Ling mine on North Star mountain, 10 miles from Alma. The company is working the Stonehouse level on the north side of the mountain overlooking Blue lake and the headwaters of the Blue river. They have 700 feet of work done on that side of the hill. About 300 feet more work and they will connect with the tunnel from the south slope of the mountain. They are driving a crosscut to open the vein. When connection is made with the tunnel on the south side all the ore will be taken through that tunnel instead of packing over the hill as they have to do at present. This is one of the old properties of the district, having been worked since 1884. Ore is said to average \$100 per ton in gold. It is intention of F. McIntyre of Fairplay, superintendent of the mine, to put in power drills.

Lerch & Ronfeldt are operating the Mattie and Last Chance claims in Montgomery gulch. One tunnel is in 90 feet and the other one 120 feet. These claims are on North Star and Lincoln mountains.—A. V. Holliday has a contract from the Montgomery G. M. Co. to drive a tunnel on its property on North Star mountain in Montgomery gulch 1000 feet. The tunnel is in 300 feet. He is using electric drills.

At Montgomery, the Minnesota M. & M. Co. is operating its 10-stamp mill and cyanide plant. This is said to be the first mill of its kind in that section, and the manager, A. A. Bissell, claims it is a commercial success. The mine is on apex of North Star mountain, part being in Summit and part in Park county, that mountain ridge being the dividing line of the two counties. The mill is operated during the summer months by water power taken from the Platte river, while steam is used in the winter.

Alma, July 24.

(Special Correspondence).—About midway between Alma and Fairplay is the Snow Storm Hydraulic Co., O. M. Yocom manager. This company has been operating for several years on the Platte river and owns 7000 acres of land. It also controls the Alma placers. The company is operating the Alma placers, but intends putting in larger ditches and will work on a larger scale. Most of the gold taken from the Snow Storm placer is coarse, though they have considerable fine gold.

The South Park Oil Co. is putting in a drilling outfit and expects to start operations about August 1st. It is thought that oil in commercial quantities can be found in South Park, hence the organization of this company to develop the oil prospects. Should oil be struck at that point it will be of benefit to the mines of the district.

Fairplay, July 24.

#### San Juan County.

The Gold Nugget group in Maggie gulch, near Silverton, has been sold to C. P. Campbell of Colorado Springs for \$35,000. The group consists of five claims. Its development is slight, aggregating only a few hundred feet in crosscuts and shallow drifts. Preliminary development is being done by Superintendent Van Meeker.

The breast of the 300-foot tunnel in the Spotted Fawn mine, near Chattanooga, is in gray copper and quartz, says Manager Haynes.—The Silver Ledge mine, near Silverton, is reopening. The four electric zinc separators and other machinery that has been added are in operation. With the starting up of the mill the number of miners will be increased.

**Summit County.**

(Special Correspondence).—The Mason-town M. & M. Co. is doing development work on the Victoria mine, of which they have control. This property has been idle for a number of years, and with the starting up of the Victoria it has created considerable interest in mining at this point. This mine is at Frisco, which is reached via Denver & Rio Grande and Colorado & Southern railroads. They have completed a 20-stamp mill on the property. After the ore passes over the plates it is put through cyanide tanks. They are sinking a shaft, and as soon as they strike sulphide ores will install concentrating tables. Will also put in a hoisting engine on the shaft. From the 100-foot level of the shaft they will drive a crosscut to the ledge, which they expect to cut at 130 to 150 feet. D. H. Lawrence is consulting engineer, A. E. Keables is manager. The mine is on Mount Royal, 1/4 mile above the town. Frisco, July 24.

(Special Correspondence).—The Washington M. Co., C. S. Newsom manager, has started to put the mine in shape to produce. The tunnel is being cleaned out and the mill will be started. The tunnel is in 900 feet. A larger crusher will be set up in the mill. Hoyle & Hoyle, who have a lease on the Puzzle mine, are taking out ore and keeping their mill running steadily. The sampling works at Breckenridge are averaging two carloads per day. Case & Kennedy are working their group of claims in McCullough gulch, 5 miles from Breckenridge, and are taking out ore.

Near the head of the Blue river, about 8 1/2 miles south of Breckenridge, is the Quandary Mountain M. & M. Co. new mill, which has a capacity of fifty tons per day. This mill, after running a short time, was found of too small capacity and they have added another set of rolls to the plant. The mine is a blanket deposit of lead ore running from 10% to 20% lead. The ore runs from 5 feet to 20 feet in thickness. The mine is about 1200 feet above the mill. T. J. Cooper of Denver is president and W. Nance is superintendent. Across the gulch from the Quandary Mountain mill M. Howe is putting in a compressor plant and intends driving a 1000-foot tunnel.

The American Gold Dredging Co. is owner of 2500 acres of ground, of which approximately 600 acres are dredging ground and about 1200 acres of high bar or hydraulic property. The dredging ground is in the valley of Swan creek. They own practically 5 miles of Swan valley. The high bars are on the benches above the Swan and in Gold Run, known as the Mumford & Peabody placers. The Mumford placers are worked by straight hydraulics with water furnished by the Gold Run ditch. The Gold Run ditch takes water from the Blue river about 3 1/2 miles above Breckenridge and carries it to Gold Run placers, a distance of 8 1/2 miles. The dredger which this company is operating is of the Bucyrus type, using a sluice instead of a stacker. The capacity of the dredger is about 2400 yards per day. The buckets carry 7 1/2 cubic feet each. The high bars in the Swan comprise the Galena, Ohio, Indiana, Delaware and Kentucky placers. The Galena has produced considerable gold and is noted for its nuggets. Two years ago they took out one nugget which weighed 29 1/2 ounces and another 7 1/2 ounces, together with smaller ones. This company intends putting in more dredgers to increase the work on its placers. W. W. Dyar is manager of the company.

The Providence M. Co. on Gibson hill is doing development work. It has a shaft down 150 feet and is driving from the 150-foot level and opening up ore.

Matthiesen, Griffith & Co., who have a lease on the Jessie mine and mill, are doing considerable work. It is intended to do development work and install new machinery. They have kept the 40-stamp mill running steadily. This property has been worked for several years and contains a large body of low-grade ore.

About 2 1/2 miles from Breckenridge, in French gulch, is the Wellington mine, owned and operated by the Colorado & New Mexico Dev. Co. J. F. Hight is manager. They have a crosscut tunnel in 865 feet and have drifted 600 feet on the vein. The vein is from 6 to 16 feet in width. Some of the ore is rich enough to ship, but remainder is being put on the dump with a view of erecting a mill to handle the same. They now have 6000 tons on the dump. The ore contains lead, zinc and iron. Stopes are opened, but they are doing development work at present.

The Old Union M. & M. Co., E. A. Keables manager, was organized last January to operate the Old Union group, which in the early days was one of the producers of Summit county, but owing to litigation has been closed down for several years. The company intends doing

considerable development work and has several bodies of milling and shipping ore opened. The old Union vein carries lead, gold and silver, shipping returns showing \$22 to \$60 per ton. The new Union vein is a milling ore of zinc, lead, gold and silver, running 20% to 30% zinc, 25% to 40% lead. The vein is from 3 to 4 feet wide. The company is sinking two shafts, one for a working shaft, 250 feet apart; also running a crosscut tunnel, which is in 250 feet. The company will erect a 75-ton mill.

The Lincoln G. M. Co. on French gulch has bought the Mecca property, which consists of 1000 acres of placer ground and water rights of 2000 inches volume. They are putting in a bedrock flume 2000 feet in length. They have abandoned the elevators for the present.

Breckenridge, July 25.

Last week the Gold Run ditch broke at a point 1 1/2 mile south of Breckenridge, which turned a large volume of water loose on the west side of Little mountain, causing damage to the amount of \$2500 at the site, besides loss to the American Dredging Co., which uses the water to operate giants on the Peabody placer in Gold run. The length of the ditch from intake to pressure box is nearly 10 miles. It constantly carries a large volume of water. South of Little mountain the pressure box and waste gate of another ditch—the Gold Pan—are located. The waste water from the Gold Pan ditch runs down a ravine and about half way down the hill crosses the Gold Run ditch by means of a frame apron. At the intersection of the two is where the break occurred. The break made a hole in the Gold Run ditch 200 feet wide and 15 feet in depth, which requires the building of an elevated flume to restore connections. The Alma wagon road below the ditch was also damaged.

**Teller County.**

The Mountain Lion Leasing Co., operating the Happy Year mine of the Central Con. Co. on Bull hill, Victor, will install a plant of machinery and air compressors. The company has 3 feet of ore, which is being broken down, which it is said will pay to ship. The ore is being mined 50 feet from the shaft at a depth of 285 feet. Development work will be done on several showings already found. The main shaft is down 400 feet.

J. Wright, who has a lease on the Zenobia mine of the Stratton estate at Cripple Creek, resumed work last week after having been closed down for two months. The mine was shut down, due to legal entanglements. Lessee Wright will start the men in each of the five crosscuts to make connections between the main workings and the incline shaft.

The Bull Hill M. & Dev. Co., operating the property of the Cresson Co., on Raven hill, Cripple Creek, has started excavating preparatory to putting in a plant of machinery. It will sink the shaft an additional 300 feet, which, when completed, will make the shaft 600 feet below the collar. With that work completed it is intended to drive the levels to determine whether or not the ore opened in the 300-foot level extends to greater depth. The lessees operating the lower Trail tunnel are putting in an electric hoist, with which they intend sinking below the tunnel level.

On the 26th inst. Governor Peabody issued a proclamation calling off military rule in Teller county and placing the Cripple Creek district in charge of the civil authorities. This action is said to have been taken by the Governor in face of opposition from influential citizens of Cripple Creek, who desire to prevent deported union miners from returning to the district. Before issuing the order, however, the Governor received assurances from Sheriff Bell that his men were able to control the situation. Over 4000 miners are working and nearly every mine is running full handed.

**IDAHO.****Boise County.**

Superintendent Stallings, of the Lincoln mine, at Pearl, says developments are progressing on the 350-foot level, where exploratory work has been under way. A 4-foot vein of ore has been disclosed. In the west drift on same level has been opened 7 feet of milling ore. Both drifts have been in ore all the way from the incline. Work is also being pushed on the 950-foot level east from the incline. The mill is running and turning out concentrates.

**Idaho County.**

(Special Correspondence).—It has been reported that freight rates into the Buffalo Hump section are excessive; but, while they are not as low as for more favored camps, they are still not so high as the reports would indicate. The cost of freight at the Jumbo mine is 2 cents per pound in summer, and 4 cents is the

highest paid in the winter season. There are two good roads into the camp.

Concord, July 20.

The Concord M. Co., operating in Buffalo Hump, is putting in a four-drill compressor. Machinery for the mill has been unloaded at Stites. W. Q. Brown, manager of the Concord, is employing twenty-six men. He has a shaft 100 feet deep on the Concord lode and has started drifting both ways. The ledge is 7 feet wide, carrying gold values. The late Jumbo cleanup was \$10,000 for a thirty-day run with twenty stamps. The property is working thirty-five men.

**Kootenai County.**

St. Maries reports say the Tyson G. M. & Dev. Co. has started preliminary survey for 60-mile ditch, for obtaining water for hydraulicking in their mines at Tyson next season.

**Owyhee County.**

Superintendent M. White has men working on the Homestake group of claims, near Silver City, bonded to S. B. Longfellow. They are doing work also on the Sunrise mine. Ore is being opened up.

Since burning out of the electric transformer at the Addie mine, near Silver City, a gasoline engine has been set up to supply air for the miners, and will do duty until another transformer can be obtained. The work in the mine is progressing, but the mill must continue its shut down until the electric power can be turned on again.

**Shoshone County.**

Wallace reports say the Bunker Hill & Sullivan M. & Conc. Co. filed twenty-eight locations with the county recorder last week. Of these, twenty-two were filed by C. M. Lindley for the company, while the remaining six were amended locations made by the company itself. All are in Yreka mining district.

The Little North Fork C. M. & M. Co., owned by G. Harris, D. Mason et al. of Wardner, has two shifts of miners at work. The lower tunnel is in 500 feet, and there are 3 feet of ore in the breast of the drift. Within 50 feet farther they expect to be directly under the ore shoot which was opened nearer the surface. The ore carries copper pyrites.

**KANSAS.****Cherokee County.**

H. Goodwin will sink a new shaft south of Baxter. There will be a dozen or more new shafts going down on drill holes near Baxter Springs. J. W. Perry, of Joplin, Mo., is putting down a drill hole on the Angel land and is 95 feet in good dirt. The Sunny Side plant is running steadily and has several carloads of ore on hand. L. J. Hainer and G. Boughton, of Galena, have leased ground near the Mission mine and have a hoist and everything ready to put up as soon as the roads are dried up.

The Ford & Troupe Mission mine plant at Baxter Springs is running steadily on payable ore. In running a drift on the east a vein of clear jack was opened which shows a 5-foot face 12 feet long and is increasing in depth as the drift advances. This company has a carload of jack and a carload of lead ore in the bins, and as soon as the roads are passable will make their first turn-in if prices of ore hold up.

Walker & Spiva, of Galena, have started a shaft on the Opperman lease, on Willow branch, at Baxter Springs, and a shaft at a depth of 4 feet from the surface, showed up pay dirt, both lead and jack. This is near where a shaft was formerly put down and was abandoned on account of a failure to beat the water.

The Baxter M. Co. has leased 200 acres of E. H. Tousey, west of Abram's, and will begin prospecting with the drill at once. This company has also leased 240 acres from R. Quapaw and 240 acres from Minnie Greenback—Cornor, the latter lying east of Spring river. Their drill prospect on the Dardenne land is showing values, and 15 feet of rich lead ore was passed through between 75 and 100 feet. The hole is now 150 feet and in flint and limestone.

Near Empire City, G. McCullagh is drifting at 120 feet and H. Poole & Co., on the Illinois Lead & Zinc ground, are sinking a shaft, says the Joplin News-Herald. Miller, Bally, Pickett & Pickett are sinking a shaft on the Illinois Lead & Zinc ground. They are down 16 feet. The Lockport M. Co. is running the old Lockport mill. Stone, Pinson & Hallam are taking out three and four tons a shift in the old Duck Pond mine, on the Lou Dillon lease. They are working at 114 feet with only one pump working. Some fine tailings pile ore was on exhibition last week at the Murphy crusher office. The ore was sold at \$36. The ore was originally put in the gravel pile by Sparks, Vest & Fulton, in Gin hollow, Empire City. The Owl mine, on Owl creek, is

working steadily at 100 feet. The water, though stronger than usual, has not been greatly increased by the flood. It is thought that the water from the flooded mines in the bottom will seep through and affect the mines on Owl creek.

Boughton Bros. on the Victoria ground at Empire have their new shaft completed and are drifting at 110 feet. They are cutting a small drift through the floor of old workings to have room underground to work their dirt, and expect to take up a 25-foot stope of rich ore.

**MISSOURI.**

The production of zinc ore in the Missouri-Kansas district during the first quarter of 1904 is reported at 65,000 tons. The production in the first quarter of 1903 was 58,381 tons. The average price reported for the output in 1904 is \$33.30.

**Jasper County.**

Wells Bros. have made a rich strike on the Allan Hardy land, northeast of Joplin. In a drill hole they struck lead at 100 feet, went through 25 feet of that ore and then into jack, where the drill now is. The lead cuttings are rich. C. and H. Wells have first lease on a 10-acre tract of the land, which is 1/2 mile north and west of the Independence mine.

E. Gates of the Gates-Nail M. Co., at Four Corners, south of Carl Junction, reports a strike of rich lead and jack in a stope from the mill shaft. Mr. Gates says it is the best dirt they have ever had.

The Alice H. M. Co. of Joplin has been incorporated. The shareholders, all of Joplin, are as follows: W. P. Leon, C. W. Power, O. H. McKennon and E. H. Mower.

At the Southside mining ground, near Joplin, says the News-Herald, the water is all out of the ground, and the miners are at work in every shaft worked before the flood.

The Good Eye mine, incorporated as Palmetto No. 2, is not working, as the old shaft nearer the mill site is being cleaned out and pumped to a depth of 150 feet.

Bullene, Huff & Co. are sinking a shaft on 5, west, and Swaney & Co. have installed a horse hoister and steam drill on lot 15, west. Garner & Co. are working at the 80-foot level and keeping mill No. 1 running. Tuthill & Co. have started a new shaft on 22 west.

Thirty-eight mining companies and leasers in the vicinity of Joplin report sales aggregating 2,209,740 pounds of zinc ore and 313,800 pounds of lead for the week ending July 16. The zinc was valued at \$39,775 and the lead at \$8,470, a total of \$48,245 for the week. The output for the entire zinc-lead field of Missouri, Arkansas and Kansas adjacent to Joplin is reported for the week as follows: Zinc, 7,913,590 pounds; lead, 862,280 pounds. Values: Zinc, \$133,315; lead, \$23,100; total, \$156,415. For twenty-nine weeks of 1904: Zinc, 289,298,140 pounds; lead, 36,250,470 pounds. Values: Zinc, \$4,766,870; lead, \$1,002,330; total, \$5,769,200.

**Newton County.**

At Sherwood, on the Creller & Young land, the Rice M. Co. is increasing production and reports an output of \$25,000 worth of ore since it started, February 1, last. This company has its second shaft sunk into the ore body which will furnish air circulation. Owing to the cheapness in breaking the ground, the ore is produced at an expense of about \$10 per ton, and brings the highest market price, as its metal contents have averaged 63% zinc. One car was 64 1/2% and several 64%. The Excelsior Z. & L. Co. has a block of the same number of lots on the south and is sinking two shafts on them to reach the same ore body that has been out to the line by the Rice M. Co. The Webb City Iron Works of Webb City, on the east of the Rice M. Co., is sinking its fourth shaft on a drill hole. When this reaches the ore body they will erect a mill. Varner & Co. on the Johnson land have their 100-ton mill in operation and are cleaning ore at rate of a ton an hour. The Utility & Gates, Nails & Martin on the Mitchell land, Smith & Stickney on the Smith land, Bailey & Stickney on the Bailey & Robinson land, McManamy & Co. on the Barbee & Connor land, the East Sherwood mines on the Hatfield land, and J. A. Hardy on the Allen Dickson land, are each developing deposits of ores.

**MONTANA.**

The report of B. H. Tatem, in charge of the United States assay office at Helena, for June shows the amount of gold received exceeded the receipts for June, 1903, by \$31,000, the amount for June, 1904, being \$202,153. Of the receipts for June, Montana contributed \$177,026, a gain of \$52,437 over same month last year.

**Beaverhead County.**

O. Quintrell, with M. Allen, has con-

tract for 800 feet of tunneling on the Pluto mine, near Dillon, and is putting in machinery with which the work is to be done. The plant consists of an air compressor, drill and boiler.—The Independence M. Co., of which E. W. Honchen is president and H. O. Granberg is secretary, has recently been organized and absorbed the Leighton-Gentry property. These claims end line the Congo.—The owners of the Congo are putting men to work to increase development.

#### Broadwater County.

R. A. Bell of Helena has resumed operations at the East Pacific mine, near Winston, and is again shipping high-grade ore after an idleness of several years. The new ore body was found outside the old workings. A concentrator will be built at the mine.

#### Deer Lodge County.

G. D. Curtis says the Red Lion mine, west of Anaconda, and near the Hannah group and the Gold Coin, will be reopened. The property has not been worked for several years.

#### Lewis and Clarke County.

The mill of the Bald Butte M. Co., near Helena, is again in operation. Development work will be continued in addition to regular operation of the plant. The drift on the vein recently struck is in 63 feet, showing 7 feet of ore, which assays \$25 in free milling gold. The vein is apparently a parallel to those which formerly made the Bald Butte a gold producer. B. H. Tatem of Helena is secretary of the company.

The Inter Ocean M. Co., operating near Rimini, has bought twenty-one full claims on Red mountain, and in driving a tunnel on one of them reports it has cut four leads, the ore being copper, gold, silver and lead.—Hoffman & Backen have made initial shipment from their group in Red Mountain district, which netted \$100 a ton. The values are in copper, gold, silver and lead.

#### Missoula County.

While waiting for a diamond drill with which to further prospect its ground, the Leslie C. M. Co., near the Idaho line, east of Wallace, Idaho, set up air drills and succeeded in getting through the fault on the south ledge, which had proved an obstacle, by running only 25 feet, and found the ledge to be 30 feet wide, carrying copper and galena values, says the Wallace Press. After crosscutting the ledge, a drift was started, which is in 60 feet, with the face of the tunnel in concentrating ore. The Leslie is 1 mile from the Northern Pacific Railroad, with a good wagon road to the mine, with only a 5% grade. The property is equipped with a compressor plant and other machinery and has water power.

#### Park County.

A Livingston report says that fire last week did damage to the Cokedale coal mines to the extent of \$4000 and for a time threatened the lives of six miners, who were brought to the surface in an unconscious condition. The fire originated on the fifth level. The Cokedale mines employ 100 men and will be closed temporarily as a result of the fire.

#### Silver Bow County.

At the Belmont mine at Butte on the 24th inst. three miners were drowned by the breaking of a bulkhead which held back the water of the Cambrus mine. The shaft is full of water.

Additional suits have been begun in the District Court at Butte by the Boston & Montana C. Co. on account of the alleged looting of large quantities of valuable ore from the adjoining mines through the Minnie Healy workings. In two suits judgments are asked to the amount of \$7,400,000. In the five suits begun against F. A. Heinze and his agents, alleging looting of ore from the Michael Davitt, Little Mina, Colusa, Piccolo and Gambetta mines, the judgments in damages that are asked aggregate \$16,850,000. The last two suits were against Heinze corporations alleged to have been in charge of the Minnie Healy at different periods in the complicated proceedings that have arisen through the litigation over the property. In the testimony given in court it has been stated by Heinze and his agents that during certain intervals, in turn, the Minnie Healy Co., the Montana Ore Purchasing Co., the Johnstown Co. and the Hypocka Co. were conducting the operations in the mine. In the complaint it is stated that the Colusa, Piccolo and Gambetta mines lie adjacent to each other, forming one compact body of mineral ground, and the properties are worked as such. At a point in the earth the three ore bodies unite and form one large vein. Prior to the time when Heinze secured possession of the Minnie Healy property, the mine had never been a paying one, although it had been ex-

tensively prospected at a large expense by experienced miners. The Boston & Montana Co. now claim that through the exploitation of adjoining properties the Minnie Healy has been made to pay richly.

### NEVADA.

#### Lincoln County.

It is reported J. Johnson of Salt Lake City, Utah, has an option on the Ryan holdings in Pennsylvania mining district, 20 miles from Caliente, for \$36,000. Development of the properties has exposed ore carrying silver and lead with copper and gold. Work will be increased.

The Portland & Boston M. Co. has been organized to operate the Baltimore, Radical and Porcupine mines, north of the Parallel and west of the Santa Fe mines at Searchlight. P. A. Dow, W. B. Currier, R. and S. Dennis, A. and H. Dow of Los Angeles, Cal., are officers. Work has begun on the Radical, with W. B. Currier in charge.

The last month's cleanup of the Southern Nevada mill, at Searchlight, amounted to \$12,174, says the Searchlight, and represented 370½ hours' run. The ore averaged \$21 a ton. The ten stamps are dropping sixteen hours a day, but by using a coarser screen and more water better results are said to be obtained than formerly. The McDonald incline is producing high-grade ore showing free gold. The vein is small. South of the open stope, a 2-foot vein has been uncovered which is being developed.

#### Nye County.

The railroad was completed to Tonopah on the 23rd inst. and the arrival of the first train was accompanied by a celebration. Ore shipments have been held back for the past few months waiting the coming of the railroad.

### NEW MEXICO.

#### Grant County.

The Burro Mountain C. Co. has started its concentrator at the St. Louis mine in the Burro mountains, near Silver City, says Manager G. Newcomb. The number of men working underground is being increased.

At the Comanche smelter, near Silver City, men are at work improving the water system at the old smelter site, preparatory to operating the new plant.—The Chatham smelter is again in operation after a temporary shut-down.

At Fierro, the Colorado F. & I. Co. has resumed operations in its iron mines, and has 100 men at work and will put on more. It is intended to ship 50 cars of ore per day.

#### San Miguel County.

The Pecos C. Co. is preparing to develop its claims, 7 miles south of Willis, in the Pecos forest reserve near Glorieta on the Santa Fe railroad. The mines are 22 miles from Santa Fe. Machinery will be put in. The main shaft is down several hundred feet and is connected with the dump on Willow creek by a tunnel. The vein has been entered 35 feet. Water in the shaft is being handled by a steam pump. The mine was formerly the Hamilton. The company has a power site on the Pecos river. This power will be supplemented by a steam plant. O. W. Alexander of Cerrillos is superintendent.

### NEW YORK.

#### Orange County.

Middletown reports say a strike of gold and silver ore has been made in an abandoned lead mine in the Shawangunk mountains, near Otisville.

### OREGON.

#### Baker County.

Development work has been resumed on the Minnie McDowell group of claims in the Cable Cove district, near Sumpter. Tunnel work will be carried on from the point left off last season.—L. V. Swiggett, who has bonded the Golden Chariot group, east of Sumpter, is preparing to increase development. A sinking plant will be installed. The first work will be sinking a 100-foot shaft on the ledge. Swiggett also has charge of the Constellation group, in Cable Cove district, and the Orleans, in Cracker Creek section. Both these properties will be developed with the Golden Chariot by the Philadelphia Co. A hoist will be put in at the Orleans and the main tunnel of the Constellation will be driven ahead.

Arrangements are being made for a cyanide plant at the E. & E. (Eureka & Excelsior) mill, near Sumpter, to handle the slimes from the 20-stamp plant. The leaching plant is to be placed on Big Cracker creek, a short distance below the mill, where a gravity discharge of the pulp will deliver it. Manager Wyatt is impounding the tailings, having a separating device which is a conical settler,

coarse sand going out at the bottom while the fines and slimes are discharged over the top. The fines are impounded in a dam and a second basin is also used to settle, as far as practical, such fine stuff as goes through the first. Operations at the mill are continuous. In the mine development is being done in the adits and 170-foot level of the shaft.

The operation of the Golconda mine of Sumpter has passed from the Golconda Co. to the Geiser-Hendryx Co. of Sumpter.

#### Douglas County.

J. H. Pearsons, secretary of the Oregon Securities Co., operating at Bohemia, says the tunnel which is being driven through the Champion to the Musick mine has reached a depth of 525 feet. A large amount of high-grade ore has been blocked out from the Musick mine, and by Aug. 1 the company's 30-stamp mill will begin grinding ore. The tunneling operations are being carried on through a ledge 45 feet in width.

#### Lane County.

S. Standish, part owner of the Great Northern mine at Blue River, says he will put in a Huntington mill at the mine. The new mill will increase the daily handling of ore from ten to thirty tons, turning out \$10,000 in gold every month. A tramway will be built to carry the ore from the mine to the mill, so that the property can be worked in the winter, when there is snow.

#### Malheur County.

W. Albrecht of Baker City, president of the Zenith Oil Co., reports that oil has been found in several localities in Malheur county, and that the owners of oil lands are waiting the experiments being made by Blood et al. of Boise, near Ontario. Ontario is in the gas belt, and to get oil it will be necessary to go deeper than farther up the basin; but, if Blood opens up producing gas wells, it is expected he will bore deeper to strike oil. The Malheur oil is said to have a paraffine base.

### SOUTH DAKOTA.

#### Custer County.

The Ruberta M. & M. Co., near Custer, is equipping its property with a stamp mill and cyanide plant. W. W. Olds is president and manager.

#### Lawrence County.

Deadwood reports say the Puritan M. Co. is working men on its property along Big Strawberry gulch grading for a mill and building a shaft house. The gallow frame for the latter is up. Machinery for the hoist and mill is on the ground. The company is composed largely of Kansas City, Mo., men, and owns acreage along Strawberry gulch. Machinery was bought of the North Star M. Co. and has been moved up from Custer county. There are ten stamps in the mill, also steam hoist, air compressor, drills, pumps, etc. A shaft was sunk to 90 feet. As soon as the hoisting machinery is in place sinking will be continued to depth of 500 feet.

The Tinton Tin Co. has appropriated \$500 to be used in making repairs on the wagon road between Iron creek and Tinton, necessitated by the damage of recent high waters. The company expects to increase its number of men at work as soon as the road is made passable, and will continue its production of tin. The plant treats the ore by concentration. It passes through Gates crushers and rolls and over table concentrators. The capacity is 100 tons per day. The concentrated product has been shipped for refining, and there is stored in the mill building a quantity awaiting shipment.

The Golden Crest M. Co. is resuming operations on its property in Two Bit gulch, near Deadwood. A heavier hoist has been set up at shaft No. 4, and this shaft is expected to supply the mill with ore. The opening is 80 feet deep and lateral work has shown ore above that level. The new hoist is of the double-drum type, and is housed by a frame building having a 20-foot gallow frame. A tram track has been laid from the shaft to the mill. Shaft No. 4 supplied the mill during the last few months that it was working, the ore being hauled in wagons.

The Goldstake M. & M. Co. last week made final payment on its property on Elkhorn gulch near Maitland, and is increasing operations. The company owns two water-rights on Elkhorn gulch which will be developed for use in a reduction plant. A tunnel is being driven convenient to the mill site. The company's holdings consist of the Rich Hill group, the Elkhorn and the Spokane groups, covering an area of 150 acres. O. V. Pryce of Deadwood is vice-president and manager; and G. W. Wilkins of Maitland is superintendent.

F. Groch has leased the Rossiter cya-

nide plant and tailings dump in Deadwood and the plant is in operation.

The Elliptic M. Co., on Miller gulch, 4 miles northwest of Deadwood and 2 miles east of Maitland, is increasing operations, says Manager Leming. A shaft house is being built. The two-compartment vertical shaft is down 125 feet, and it is expected to get the quartzite at between 250 and 350 feet. A horse whim is in use, but a heavy gallow frame has been built, as a steam hoisting plant is proposed.

The Alexander Maitland M. Co., at Maitland, in Garden City district, has resumed shipments of smelting ore via Deadwood to Denver, Colo. The low-grade ore is being treated in the Maitland 40-stamp, wet-crushing cyanide mill, which is in steady operation. A 24-drill air compressor is being put in at the mine. The other compressor has a capacity for eight drills. A tunnel is being driven southwesterly to crosscut a vertical ledge on False Bottom creek, below the mine and mill. It has been started on quartzite and, in addition to development of the vertical measures along the eastern side of the creek, will connect in time with the lateral workings from the Realization shaft, thereby furnishing ventilation and drainage. A. Maitland of Negaunee, Mich., is president.

The Homestake M. Co. has in operation 1000 stamps. The 100-stamp addition to the Amicus mill at Lead is completed, connections made, and they are now dropping. This increases the number of stamps in the Amicus to 240, making it the largest mill of the Homestake Co. The Amicus mill is supplied with power by an 800 H. P. engine of marine type. The transfer of operations from the old engine to the new was accomplished with only a slight delay, and the power and water connections with the additions of the mill were effected after a shutdown not to exceed two hours, says the Review. New shafting was placed in the mill at the end next the engine and the old shafting was moved to the section occupied by the new stamps. There are now two parallel shafts the length of the mill building, each shaft carrying 120 stamps. The stamps weigh 1000 pounds each and are arranged in standard Homestake mortars. Work is progressing steadily on the addition to the Homestake cyanide plant No. 1, whose capacity will be increased one-half. The capacity of the Homestake cyanide plant No. 2 at Black-tail is also being increased by enlarging the size of its tanks, and the company's ore tonnage in both the stamp mills and cyanide plants will be materially increased during the next few months. The Homestake's milling equipment is distributed as follows:

Mill.	Location.	No. of Stamps.
Homestake	Lead	200
Golden Star	Lead	200
Amicus	Lead	240
Monroe	Terraville	100
Pocahontas	Terraville	160
Mineral Point	Central City	100

### UTAH.

#### Beaver County.

A. B. Lewis of Salt Lake City, president and manager of the Monarch Con. M. Co., owning holdings extending from Copper gulch on the south to the Montreal group, near Milford, on the north, and also mines at Pioche, Nev., says they are preparing to increase development on all of their properties. Work will be put under way next month. Machinery will be put in.

#### Box Elder County.

The New Foundland mining district on the west side of Great Salt Lake, on the line of the Lucin cut-off, is developing as a copper camp, says C. T. Birchard of Boston, Mass., manager of the Boston & Terrace property. He is arranging for the shipment of ore as soon as the railroad opens the cut-off for local traffic. In the meantime development work is progressing favorably. The group is being opened by tunnels and the main one has been completed to 1089 feet. They are making a raise to the surface for air. The tunnel has tapped a 2½-foot body of high-grade ore, which is being extracted for shipment. Assays show values of 18% lead, 10% copper, 87 ounces silver and \$1.40 in gold. The property is 5 miles from Newfoundland station on the cut-off.

#### Iron County.

Operations at the Johnny mill at State-line are temporarily suspended pending connections between the new and the old ore bodies in the mine. It is expected ten more stamps will be added to the mill. W. J. Dooley of Salt Lake City is manager.

#### Piute County.

J. Long, Jr., manager of the Gold Mountain Con., whose properties adjoin those of the Annie Laurie at Kimberly, says the prospect tunnel has advanced 470 feet into the zone, where the ledge will be tapped 130 feet deeper. With satisfactory

results there the main tunnel will be started. At the Sevier the management is increasing work, with a method for overcoming losses in slimes to be installed, while at the Annie Laurie the production of gold bullion continues steadily under Manager A. E. Hyde, Jr.

#### Salt Lake County.

With a steady volume of high-grade copper, gold and silver-bearing concentrates coming from the mill in Bingham canyon, near Bingham, Manager D. C. Jackling, of the Utah C. Co., says four more Wilfley tables are on the ground to increase the battery at the company's mill to forty. Superintendent F. P. Janney is setting them up. The first carload of vanners, of which thirty-two will be added to the equipment, is expected this week. With this additional equipment, says Manager Jackling, the company will be prepared to reduce 600 tons of ore daily, and from that the means with which to construct other units until a capacity for reducing at least 5000 tons daily will be reached.

E. A. Wall has bought the Dewey mill at Bingham and will utilize it in the treatment of the second-class ores of the Kingston group of claims.

The capacity of the Yampa smelter, in Bingham canyon, at Bingham, under Superintendent H. C. Bellinger, is to be doubled, says the Tribune. To that end a second furnace, corresponding with that now in operation and at which an average of 200 tons of ore is being daily reduced, will be put in. With this additional equipment in commission, the management expects to produce a matte of quality that shall enable it to ship the product. Meanwhile the calcining furnace has been tried with satisfactory results and another will be added. It is a single-hearth machine with power-driven rotary rables. Meanwhile the company's mines are putting out as much ore as at any period since the company began to draw upon them. In addition to the tonnage going to its own plant, it is delivering ore under contract with the American S. & R. Co. The method improvised by the management enables it to move the output entirely by gravity to the main tunnel, where it is loaded on cars that are pulled out by mules and dumped into receiving bins on the line of the Copper Belt Railway, over which it is forwarded to the furnaces. It is expected the company will equip the main tunnel, 3000 feet in length, with an electric locomotive.

The waters of Adamson Springs, near Garfield Beach, are to be added to a supply that will enable the Utah C. Co. of Bingham to ultimately reduce 5000 tons of copper, gold and silver-bearing ores daily, says the Tribune. With this the copper company will have added 3000 gallons per minute to its resources, its contract with the Bingham Con. M. Co. for the output of the Dalton & Lark tunnel assuring it a minimum of 1600 gallons per minute, while from the shaft on the Old West mountain placer it is pumping 1000 gallons per minute. This supply, economically used, is expected to enable the company to reduce 1000 tons daily with catch basins and equipment for repumping. In what manner Adamson Springs shall be made to serve has not yet been decided, says President MacNeill. It may be piped and pumped to camp, where another mill, constructed entirely of steel, may be built, and again the ores may be taken to a plant near the springs, in which latter event they would be trammed to that point.

The Emily S. M. Co. of Utah has been incorporated to work the Emily silver and copper mine at Alta. The officers are J. P. Henderson president, M. Fargo, J. F. Baster and C. F. Harris.

#### Summit County.

Men have been taking out some of the machinery from the Old Marsac mill, near Park City, and what can be used of it will be taken to the Ontario mine and set up in the new works to be built there. At the Ontario mine the work started there, since the fire, continues. The gallow-frame is in place, and the engine at the old Daly has been taken down and is ready to be hauled to the new plant. The timbers in the shaft injured by the flames have been replaced and by September 15 it is expected the mine will be working again. About thirty men are working on top, and a little ore is being taken out on the 600-foot level.

T. M. Stringer has two jigs at work on the second-class ore dump at the Woodside mine, near Park City. The ore has been accumulating for five or six months past and a little is being taken out as development progresses.

#### Utah County.

The Clipper & Silver King Con. M. Co., which owns property in American Fork canyon, near American Fork, has been incorporated. The officers are J. Wooten president, J. Armstrong, E. H. Boyle, C. Armstrong and M. O. Randolph.

#### Washington County.

Approximately 6000 ounces of fine silver were shipped last week by the Brundage M. & R. Co., operating in Silver Reef mining district, from its mines near Leeds. This is the first shipment of any consequence made from that district for some years, says the Tribune. The Brundage Co. is increasing work. The company is developing the following mines: The Free Coinage, Walker, Jumbo, Barbee, Wonder, Lucky Boy, Jack Whacker Nos. 1, 2, 3 and 4. The property is equipped with a 5-stamp mill and an increase in stamps and productive power is expected.

#### WASHINGTON.

##### Ferry County.

The Copper Key mine, in Lambert creek section, near Republic, is being reopened. A winze sunk on the vein from the crosscut tunnel is to be sunk deeper. The Copper Key is on the Belcher vein and produces iron oxide. A wagon road has been built to the property which connects with the main road to the Belcher mine. Ore is being sacked for test shipments to the smelters.

##### Lincoln County.

The Providence mine at Cedar Canyon, near Davenport, has been taken over by the Providence M. Co., organized under Maine laws by W. H. Cornforth, Fitchburg; W. H. Gulliver, Portland, Me.; A. Vittum, F. E. Houghton, F. J. Parker and D. H. Whipple of Boston, Mass. The mine is 100 miles from the Minnehaha and Hercules properties, operated by the Houghton-Thurston Co. It will be placed in charge of S. L. Boywer, who is in charge of the other properties.

##### Okanogan County.

The Olentangy M. Co. has started men sinking on the Colon mine, northwest of Chesaw. The Colon is a high-grade gold property and is owned by Ohio men.

#### WYOMING.

##### Carbon County.

Encampment reports say R. Deal, T. Weldon and N. Land are taking out mica of merchantable quality from a deposit they have found in the Elkhead mountains west of Encampment. The deposit is about 200 feet in width and outcrops for 1000 feet and was found below timber line at a height of 12,000 feet.

The Beulah M. Co., operating in the Battle Lake region, has been reorganized as the Beulah C. M. Co., and the Finance group of claims added to the property. J. F. Ledbetter of Salt Lake City, Utah, is manager. H. Tibbals is also interested. Operations will be increased.

From the reduction works of the North American C. Co. at Grand Encampment there are shipped per week five cars of blister copper, which runs 99.5% copper. It is expected the output will be increased to six cars a week.

#### FOREIGN.

##### AFRICA.

###### Transvaal.

The monthly reports of some of the principal Transvaal gold mines for June show the following:

Mine.	Stamps Dropped.	Tons Milled.	Output.
Glen Deep	100	13,030	233,579
Jumpers Deep	100	15,658	22,027
Nourse Deep	75	9,760	20,414
Geldenhuys Deep	165	20,010	40,799
Robinson	165	22,993	59,754
Ponanza	55	8,100	22,610
Jumpers	55	7,230	10,449
Durban	55	7,920	15,769
Langlaagte	120	18,866	25,854
Geldenhuys Est	80	12,336	23,177
Ferreira	65	9,886	29,308
Crown Deep	145	19,720	37,885
Rose Deep	160	22,141	37,297

The management of the Geldenhuys Deep is the only one complaining of a scarcity of labor.

##### AUSTRALIA.

###### South Australia.

South Australia during 1903 produced minerals of the value of \$520,000. Mining on the largest scale was at the Wallaroo and Moonta copper properties, where 164,800 tons of ore, carrying from 2.92% to 3.13% copper, were treated. It appears that there is probability of the Burra copper mine being reopened, as prospecting work has given encouraging results. Tarcoola remains the most important gold mining field of the State, 4863 ounces having been won during the year, of which 4451 ounces came from the Tarcoola Blocks mine. The export of salt from the deposits on Yorke's peninsula was 40,000 tons.

###### Western Australia.

During 1903, at the Great Boulder Perseverance mine at Kalgoorlie, 132,593 tons of ore and 74,913 tons of tailings were treated for a return of 213,180 ounces of gold bullion of value of \$739,249, the

profits amounting to £396,567. The reserves of ore were estimated at end of 1903 at 401,677 tons to the 700-foot level, so that the mine is developed three years ahead of the plant. The main shaft is down to 1135 feet. Sulphide ore treatment costs have fallen to 19s 3d during the year, as compared with 22s 11d during 1902.

#### BRITISH COLUMBIA.

##### Boundary District.

Up to May 1, 1904, there had been done a total of sinking and raising, 5705 feet; drifting and crosscutting, 17,693 feet; diamond drilling 1493 feet at the Granby mines, at Phoenix. Up to the same date shipments of ore were 1,104,008 tons, says the Rossland Miner.

##### East Kootenay District.

A zinc smelter, the plant to cost \$100,000, will be built in Fernie by the Anglo-French Syndicate, reports the head office of the Crow's Nest Coal Co., which has entered into an agreement with Manager Ferneau, who will put up the works in return for obtaining land and slack from the company on favorable terms. Ferneau's principals in London have been in correspondence with the coal company and have obtained a site of several acres on north side of the Coal Creek Railway, near Fernie. Preparations are being made also for construction of a zinc-enriching plant at Rosebery, in the Slocan, from where most of the ore will be obtained. The Fernie plant will be the zinc reduction works, and there the concentrates will be reduced to zinc matte.

##### Nelson District.

At Ymir the Dundee, Foghorn and Porto Rico mines are announced to resume operations.—J. Gille is resuming development work on the Heatherdew group, near the Foghorn mine, on Wild Horse creek. It is a free milling proposition.—G. H. Barnhardt, who has the Porto Rico mine leased from the Canadian Pacific Ex. Co., of London, will resume operations there next month.—W. Walde, manager of the Queen mine, at Salmo, last week shipped a gold bar valued at \$2900 which represented a run of fourteen days at the 10-stamp mill. He has sixteen men at work on mine and mill.

##### Rossland District.

The pay rolls for last month at Rossland distributed over \$75,000. The details, says the Rossland Miner, are as follows:

Le Roi mine	\$14,800
Le Roi No. 2	9,400
Center Star	15,250
War Eagle	10,375
Rossland Power Co.	7,375
Jumbo	4,000
White Bear	3,000
Spitzee	1,700
Rossland-Kootenay	4,000
Velvet	3,000
Minor wage rolls, including Iron Mask, Cliff, ore teams, etc.	2,000

Total wage roll ..... \$75,300

In addition to the foregoing the mines specified have a salary list, probably aggregating \$15,000, which does not appear in the wage roll.

At the Canadian Smelting Works at Trail No. 2 lead stack has been blown in. The lead smelting capacity of the works will not be overwhelmed, for No. 3 lead stack will be still in reserve. An accident entailed closing down one copper furnace pending repairs.

##### West Kootenay District.

J. Gottlieb of Comaplix, at northeast arm of Arrow lake, Lardeau district, says mining operations at Camborne and Goldfields, in Fish river district, are being conducted with satisfactory results. The Great Western company, which is operating a 10-stamp mill, has completed excavations for placing ten additional stamps, which will be in operation this season. The Eva mill at Goldfields is running full capacity on ore that yields \$12 per ton. Gottlieb is developing his Little Joe group at Comaplix. There are four claims in the group, on each of which the lead has been opened. One is 22 feet wide and contains ore shoots that carry gold values. The ores are free milling.

#### MEXICO.

##### Chihuahua.

L. A. Beachel, of El Paso, Texas, and Chicago, Ill., men, have bought the Victoria mine, about 14 miles from the Barranca del Cobre copper mine, near Barranca del Cobre. Development work will start this week. It is intended to build a small smelter this year. The ores are silver-lead, with a small per cent of gray copper ore.

In the southern portion of Chihuahua, near Batopilas and Urique, cloudbursts are reported to have done considerable damage. The country has been dry for some time, and the rains will enable all mines to resume after a shutdown of many months as soon as the damage from

the cloudburst is repaired. No lives were lost.

G. B. Jacobs and S. Lawrence of Chihuahua City, who have a lease and bond on the Dolores mine in Santa Eulalia district, are putting in a concentrating plant of forty tons daily capacity. Hand jigs will be used.

At Santa Eulalia, W. K. Ryan of Ryan & Dudley, who are building the extension of the Chihuahua & Pacific Railroad, has bought three mining properties adjoining the Santa Juliana mine. The properties are La Ibera, La Isla and El Continente, aggregating 106 pertenencias. Ryan expects to start work next month and will make his headquarters at Chihuahua.

Four different outfits are working in Minillas camp, 15 miles from Chihuahua, says the Enterprise. S. Navarro has men working on the Minillas mines. The San Jorge-Minillas M. Co., an English corporation, is developing its property. F. Schmidt has started work on his 29 de Febrero and says he has payable ore.

At the silver-lead camp of Santa Eulalia, 15 miles from Chihuahua, in the Josefin mine, being opened up by the American & English Co. by Manager S. G. Burn, ore running \$10 per ton in gold has been cut, says the Enterprise.

A concession has been granted by the State Government to M. Krakauer of Chihuahua City for building an aerial tramway at Santa Eulalia, connecting the principal mines of the district with the mineral railroad at Santa Eulalia station. The tramway will be 4000 meters long, with an allowance by the concession for an additional 4000 meters.

##### Guerrero.

At San Nicholas del Oro the Balsas Valley M. Co. has its main shaft down 1200 feet and in ore. The Rosario M. Co., in same camp, is also in full operation.

At Campo Morado, the Reforma M. Co. is shipping \$20,000 of bullion per month.—La Dicha C. Co., near Chilpancingo, is blocking out its copper deposits preparatory to smelting operations.

The San Mateo and San Luis mines, near Naranjo, in Taxco district, have been sold to E. B. Lukis et al., who are preparing to put in pumps and other machinery and operate both mines.

##### Jalisco.

J. B. Izabal and R. D. Lauderdale, of Mexico City, are preparing to reopen and develop the Bolanos group of mines in northern Jalisco. There is a 20-stamp mill on the ground, but the workings are under water. The ores are said to carry gold and silver values.

At Bolanos the Zuloaga mine has been bonded for \$50,000 to F. J. M. Rhodes and J. McGrath. They intend to start operations at the mine next month.

A. M. Campanella, of Aguascalientes, says he proposes to establish a smelter at some point in Jalisco, probably Guadalajara, for which a company is being organized.

##### Nuevo Leon.

It is reported the Minas Nuevas group of mines on Mitre mountain, near Monterey, has been sold to the Minas Nuevas de Nuevo Leon Co., of which E. Doerr is president, F. A. Adams vice-president and F. W. Selover secretary. Some 550 men are employed at the mines and low-grade silver-lead ores are being shipped. It is understood the company will increase operations.

##### Queretaro.

The Ajuchitlan M. Co., of which B. Petersen, of Parral, is president, is building a 50-ton mill at Ajuchitlan for purpose of treating the ores from its gold property. It is expected to have the mill in operation in September. J. Brennon is manager and the mine has been under development for two years. A body of \$10 gold ore has been blocked out. The mine is three hours ride from the Mexican Central and the National railroads.

##### Tepe.

The wire rope tramways at the Buena Vista mines, near La Yesca, which were damaged by the fire several weeks ago, have been temporarily repaired. As soon as new cables and machinery parts reach the mines from the States, permanent repairs will be made. The production of the mill has been reduced as a result of the fire, as the entire supply of wood was consumed. The tramway used in bringing the wood from the mountain was damaged, and it was necessary to transport the fuel on the backs of mules. C. Gibson is manager of the Buena Vista properties.

##### Zacatecas.

The Mazapil C. Co. has put in power machinery at its mines near Concepcion del Oro. The plant consists of five gas engines 50 H. P. each, and they are to operate five electric motors of 550 volts and fifty amperes capacity. This is additional power to be used for hoisting and other purposes to relieve the power plant at the smelter.

## PERU.

A. W. McCune, manager of the Cerro de Pasco copper mines at Cerro de Pasco, reports the completion of his Peruvian railroad to its terminus at Cerro de Pasco. He says they were behind four months in completing the road because of the rainy season. This railroad will be 85 miles long on the main branch running from Oroya, the terminus of the present railroad, to the Cerro de Pasco mine and passing the smelter. Including the branches, the road will be 115 miles long. Its construction has been especially difficult because it runs for a good part of the way through low, swampy ground, where the work was completely swallowed up by the heavy rains until a solid road-bed was secured by hauling in gravel. Upward of 5000 men, entirely natives, were employed a portion of the time at the smelter, mine and railroad when the heavy grading was being done. They are rushing work on the smelter and expect to have it ready for operation with a 500-ton capacity in about a year. When completed it will be of 1000-ton capacity. Work continues at the mine in the way of getting out ore. They have five hoists constructed, three of them on shafts down a depth of 500 feet.

## SPAIN.

## Huelva Province.

At the Rio Tinto copper mine at Rio Tinto during 1903, there were 1,918,538 tons of ore extracted, of an average copper content of 2.39%. Of this quantity 688,919 tons were exported to Germany, the United Kingdom, or the United States, and the balance, 1,229,619 tons, was treated locally. Copper produced on the mines totaled 21,565 tons, while 14,245 tons were contained in the pyrites shipped. The revenue of the company amounted to \$8,245,000, and all expenses aggregated \$2,555,851. The dividends paid for the year aggregated \$16.98 per share. The company reports it has 130,000,000 tons of ore proved by workings and diamond drilling in its mine.

## Personal.

R. C. SPECHT has returned to Oroville, Cal., from San Francisco, Cal.

J. H. HOPPER, a civil engineer of Sonora, Cal., is in San Francisco, Cal.

A. J. MCCONE has returned to San Francisco, Cal., from Virginia, Nev.

J. B. FARRISH, a mining engineer of Denver, Colo., is in San Francisco, Cal.

W. E. DOWNS, a civil engineer of Sutter Creek, Cal., is in San Francisco, Cal.

ALVIN PHILLIPS, formerly of Denver, Colo., is about to locate in San Francisco, Cal.

E. F. FREUDENTHAL is superintendent of the Majestic copper mines at Milford, Utah.

B. S. REVETT left Breckenridge, Colo., last week for Alaska, to be gone several months.

F. F. THOMAS, manager of the Gwin mine, Calaveras county, Cal., is in San Francisco, Cal.

THOMAS CLARK, manager of the River Hill M. & C. Co. at Placerville, Cal., is in San Francisco, Cal.

A. R. BOYNTON, vice-president of the McKinnon G. M. Co. at Silver City, Ida., is visiting in California.

A. J. MALLOY is manager of the Bingham and New Haven Co. mines at Bingham, Utah, vice F. Benedict.

W. H. HARRISON of Grand Island, Neb., is looking after his mining interests in Summit county, Colo.

F. A. TAYLOR is superintendent of the Bingham & New Haven mines at Bingham, Utah, vice Coombs.

C. GIBSON is manager of the Buena Vista mines, near La Yesca, Tepic, Mex., vice J. McGrath resigned.

M. THOMPSON of Deadwood, S. D., is manager of the Columbus Con. G. M. Co., operating near Deadwood.

R. FRICK of Burlington, Iowa, is looking after his mining interests near Rowena, Boulder county, Colo.

E. J. BONSTELL, a cyanide operator of Sutter Creek, Cal., contemplates a trip to Mexico on mining business.

G. A. NIELL is superintendent of the Union mine of the Union Con. G. & S. M. Co., near Nevada City, Cal.

MANAGER STALLINGS of the Lincoln mines and mill, near Pearl, Idaho, has returned there from the East.

T. W. GALLIGER has been appointed superintendent of the Stockton mine at Stockton, Tooele county, Utah.

J. M. BENSON has been appointed master mechanic at the Oneida mine, near Jackson, Amador county, Cal.

EMERSON GEE of Los Angeles, Cal., is at La Paz, Lower California, where he is interested in copper properties.

LEONARD D. SIVYER has been examining mining property in Mexico and will now visit Tuolumne county, Cal.

C. E. GRUNSKY, member of the Panama Canal Commission, has been elected director of the Panama Railroad Co.

WILLIAM McDERMOTT of Salt Lake City, Utah, is general superintendent of the United Verde mines at Jerome, Ariz.

RICHARD A. PARKER of 217 Boston Bldg., Denver, Colo., is examining mining property in Guanacavi, Durango, Mexico.

J. R. B. TREGLOAN of Amador City, Cal., has been appointed engineer for the Shenandoah M. Co., near Plymouth, Cal.

L. H. CARVER, manager of the Mountain mine near Sierra City, Cal., has returned from the mine to San Francisco, Cal.

L. D. HUNTOON is now assistant professor of mining and metallurgy in the Sheffield Scientific School, Yale University.

W. B. JEFFS, a director in the Columbus Con. M. Co., operating at Bingham, Utah, is at the company's mines from Michigan.

F. VON FALKENSTEIN of Salt Lake City, Utah, has gone to San Francisco, Cal., en route to Valparaiso, Chili, to engage in mining.

W. T. BEANE of Deadwood, S. D., is manager of the Golden Empire M. Co., operating in Lawrence county, S. D., and Crook county, Wyo.

A. B. LEWIS, president and manager of the Monarch M. Co. of Beaver county, Utah, returned to Salt Lake City, Utah, last week after an extended trip East.

G. SNYDER of Salt Lake City, Utah, manager of the Balaklava copper mines of the Western Exploration Co. in Shasta county, Cal., is in San Francisco, Cal.

E. J. CALLAHAN has resigned as superintendent of the Santo Domingo mine of the Amparo M. Co., near Etzatlán, Jalisco, Mex., to look after private interests.

A. MIDDLEBROOK, manager of the Denver Branch of the Jeanesville Iron Works Co., was at Hazleton, Pa., July 27th, at the opening celebration of the Jeanesville Iron Works Co.'s new shops.

D. B. HUNTLEY, who has had charge of important mining interests in South Africa for some years, has returned to the United States. Mr. Huntley's present address is 1259 Webster St., Oakland, Cal.

S. L. BEYR, formerly superintendent of the Minnehaha C. G. M. Co., Washington, has been appointed general manager of all the Houghton-Thurston Co. properties in Washington and British Columbia.

GEO. L. FISHER, formerly engaged in mining in Colorado, Mexico and throughout the West generally, is now connected with the mining machinery sales department of the Allis-Chalmers Co., and is located at their exhibit in Section 82, Mines and Metallurgy Building, World's Fair, St. Louis, where he will be pleased to see his old friends and comrades.

## Trade Treatises.

"Westinghouse Industries" is an artistic treatise on the manufactures of the Westinghouse Electric & Manufacturing Co., as exemplified at the St. Louis Exposition, and elsewhere throughout the world. The booklet is for distribution at the St. Louis Exposition and is worthy of a place in the file of the company's similar publications.

The Cockerill gas engine is finely described and illustrated in a handsome quarto by the Wellman-Seaver-Morgan Co., engineers and manufacturers, Cleveland and Akron, Ohio. They are sole American licensees for this engine, which they present as being specially adapted for blast furnace blowing engine service, and for heavy duty electric light and power transmission.

Catalogue No. 6 from Pacific Tank Co., San Francisco and Los Angeles, Cal., contains prices of cyanide plants and supplies, and tanks for mining purposes. Considerable information is also furnished

regarding copper leaching and treatment of gold-copper ores by the ammonia-cyanide process. The catalogue also contains a telegraph code of every item listed which simplifies business communications. It is believed no other telegraph code in use mentions such items as used in connection with cyanide plants. The catalogue will be mailed free of charge to anyone on request.

## Commercial Paragraphs.

HENSHAW, BULKLEY & CO., San Francisco, Cal., report an order for nine more Kinkead mills to be added to four recently shipped to the same customer at Pachuca, Mexico.

THE Allis-Chalmers Co. is credited with having secured the contract for equipment and furnishing of 100,000 horse power by a turbine plant for the Brooklyn, N. Y., electric roads, which represents an outlay of more than \$2,000,000.

THE Redfield Drill Co., 1606 Blake street, Denver, Colo., have recently shipped one of their drills to Red Cliff, Colo., and one to Portland, Or. This company is getting up a new electric drill, which they will soon be ready to place on the market.

THE Little Wonder rock drill, manufactured by Martin Hardsocg, Ottumwa, Iowa, is reported as giving satisfaction wherever put in. The manufacturer has commendatory letters from California and other American States, and also several foreign countries, where the drill has been used with good practical results. Mr. Hardsocg guarantees "satisfaction or no sale."

THE National Wood Pipe Co. of Los Angeles and San Francisco, Cal., has finished a pipe line, 5 feet diameter at the mouth and 52 inches the remainder of its length, for the Imperial (Cal.) Valley irrigating ditch. They are also constructing a 5-mile pipe line for the W. & O. Power Co., Walla Walla, Wash. They are now putting in the entire pipe system for the Diamond Match Co. at the new town of Stirling, Cal., and recently supplied the town of Silverton, Colo., with several miles 10-inch patent machine-banded, redwood water pipe. The National Wood Pipe Co. further report supplying the Cleburne W. I. & L. Co., Cleburne, Texas, and making a shipment of their pipe to South Africa.

THE Progressive Concentrating & Milling Co., Boulder, Colo., manufacturers of the Tetrault improved concentrating table, has an order from the Cold Spring M. & T. Co., Gold Hill, Colo., for four of their improved tables and two Tetrault jigs, and have the contract for remodeling their mill. They report they have been able to make a saving on their improved Tetrault tables from 83½% to 87% on sulphide ores. They state they are getting in shape to manufacture the tables in larger quantities. Before selling their tables to a mining company they prefer to make a thorough mill test on the ore. They have a complete milling plant in connection with their table factory. They also handle the Tetrault jigs. E. C. Pohle is president and Alex. Tetrault superintendent. They also state they have a device for saving free gold without the use of plates. This device is made up of a series of riffles at the head of the table which they call a "gold trap."

THE well known firm of James L. Robertson & Sons, New York, manufacturers of Eureka packing, Robertson-Thompson indicators and many other useful steam specialties, in their desire to keep themselves and their goods before the public, started in February last a guessing scheme, offering three prizes—\$200, \$75 and \$25 in gold—to the engineers who guessed nearest to the number of admissions to the St. Louis Exposition on July 4th. Naturally, there were a great number of contestants. On receipt of the official figures from the secretary of the Exposition—namely, 179,258—a committee composed of the publishers or managers of the five most prominent engineers' papers examined the records and awarded to the following gentlemen: Joseph Carson, engineer for the Pennsylvania R. R. Co. (Market St. Station), Newark, N. J., who guessed 178,986, 1st prize; Mason Chilcoat, engineer American Sewer Pipe Co., Akron, Ohio, who guessed 179,738, 2nd prize; Albert Schmith, engineer American Multiple Fabric Co., Providence, R. I., who guessed 180,210, 3rd prize. The bags of gold have been sent forward to those persons and no doubt satisfactory acknowledgment of same will be returned. It is pleasant in this age of catch-penny prize schemes to note this substantial offer and the conscientious carrying out of same in a prompt manner.

## Latest Market Reports.

SAN FRANCISCO, July 29, 1904.

## METALS.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58½c, refined (1000 fine); San Francisco, 58½c; Mexican dollars, 47½c San Francisco, 45½c New York.

COPPER.—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$13.00; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £57 11s 3d spot per ton.

LEAD.—New York, \$4.25; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 13s 9d long ton.

SPELTER.—New York, \$4.85; St. Louis, \$4.75; London, £22 ½ ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$26.87½@27.05; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, \$30@32½c. London, £122 10s spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

QUICKSILVER.—New York, \$44.50@45.50, large lots; London, £8 San Francisco, local, \$43@43.50 per flask of 75 lbs.; Denver, \$46.00, Export, \$43.00@43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure, \$3.10, 50c; dust, \$3.10; sulphate, \$3.10; .04c.

NICKEL.—New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

## STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.60 @12.85; gray forge, \$12.00; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c per lb.

## Algonkian and Archæan.

There has been much discussion over and some confusion in the use of the terms Algonkian and Archæan. All geologists realize the difficulty of accurately classifying the pre-Cambrian rocks, as they are absolutely devoid of fossils, and classification can only be attempted on lithological grounds. As the character of the really primitive rocks has only been assumed to have been granite, and as granite is known to exist in different conditions, due largely to rate of crystallization, it is evident that an arkose rock, formed directly and wholly from the degrada-

age. The Huronian and Laurentian were divided into several separate periods, and this classification was adopted throughout America and Europe, as they were separated from the Cambrian rocks by at least one pronounced non-conformity. As it was recognized that in rocks of this character there might be represented several ages, J. D. Dana proposed that the name Archæan be given to the several groups of pre-Cambrian rocks, including Huronian and Laurentian. This name supplanted the term Azoic previously employed for non-fossiliferous rocks antedating the Silurian. In 1889 several members of the United States Geological Survey suggested

have been named Ontarian. Succeeding the Huronian was a long period during which no sediments were deposited, and this Professor Lawson has suggested be named the ep-Archæan interval. Following this is the Algonkian, divided into two members with an unconformity between them, followed in turn by the Cambrian, from which the upper Algonkian is also separated by unconformity. Some of the leading American geologists have already recognized this claim of the Archæan to retain its place in North American geology, not only because of priority, but for stratigraphical reasons, as it is a well-recognized fact that the Algonkian does not embrace all of the

tion of the original granite, must vary in character with the character of the original rock. These arkose rocks must also vary more or less with the distance at which the material is deposited from the original source, that at a greater distance being, of course, finer in grain than that deposited near the source.

Laurentian is a name proposed fifty years ago by a geologist named Logan for the crystalline schists in Canada along the St. Lawrence river. These rocks comprise limestones, quartzites, and conglomerates, and were known to be of fragmental origin. Later large areas were included under the Laurentian, embracing a variety of rocks other than those mentioned. Huronian is the name given to the rocks on the north shore of Lake Huron, and to some rocks on Lake Superior supposed to belong to the same

that the term Algonkian be substituted for Archæan to designate all clastic pre-Cambrian rocks. There is a series of rocks in the Lake Superior region which is clearly immediate between Archæan and Cambrian, and it has been suggested by A. C. Lawson in Bulletin of Geology No. 3, Vol. 3, of the University of California, that Algonkian might properly be applied to this particular formation, but objection is made to the substitution of Algonkian for Archæan which has become to be well recognized as a term covering the clastic rocks of pre-Cambrian age, although it was also known that these formations included igneous rocks which had been metamorphosed, and in some instances were mistaken for metamorphic sediments. In more recent years rocks have been discovered on the south shore of Lake Superior which are believed to be older than the Huronian or Laurentian, which

pre-Cambrian clastics. From the standpoint of practical mining, perhaps, the identification and differentiation of these several ancient formation is of less importance than would be the case in the confusion of rocks of any subsequent geological age, but unless it be understood that Algonkian does not embrace all pre-Cambrian rocks, but has a particular horizon of its own, there will continue to be confusion in the classification of these old non-fossiliferous rocks. There are many valuable mining districts in which Archæan rocks predominate. Noted among these are the schists of the Black Hills of South Dakota, portions of Colorado, much of Arizona, a large portion of Rhodesia, S. A., and the gold region extending along the Appalachian chain from Virginia southwesterly into Georgia, the predominating rocks being crystalline schists.

SOMETHING of the disadvantages under which the mining industry has labored in the Buffalo Hump region of central Idaho may be gained from the statement of a correspondent at Concord, who says that the cost of freight during the summer months to the Jumbo mine has been 2 cents per pound, and in winter 4 cents per pound. It requires good mines to endure such charges, but the development of the mines of that district continues and mills are being taken into the country, and no doubt within a short time railroads will be extended into that progressive district, which will permit the extensive development and equipment of many mines now considered too low grade to be operated under the conditions at present obtaining there.

SINCE the recent successful experiment of sending a diver in armor down into the lower levels of the Draper mine, near Soulsbyville, Tuolumne county, Cal., to repair a mine pump which had suddenly refused to work, a similar task has been given the same diver in one of the mines of the Utah Copper Company at Bingham, Utah. The successful termination of this second experiment will probably be sufficient to establish a precedent that the submarine diver is to become an important factor in the unwatering of flooded mines through the failure of mine pumps. The diver will soon become expert in this line of work, and success will doubtless usually attend his efforts; but he would probably draw the line in the lower levels of the Comstock, should they ever desire to avail themselves of his services, as he would be unable to protect himself against the hot water there. In working under water in a mine, the diver has the advantage of the absence of swift currents, but is somewhat hampered by unfamiliarity with his surroundings, particularly about sinking pumps, as these being located in the shaft, the footing is somewhat insecure, though better conditions obtain about station pumps. In modern diving outfits the electric light and telephone have become important attachments, which go far toward simplifying the difficulties.

## The Extralateral Right Law.

The law of the extralateral right is one which has been a source of more litigation than any other of the laws of the American mining code. There was something analogous to it in the mining laws of Germany during the sixteenth and seventeenth centuries, where an inclined location was permissible wherein the miner was allowed to take a claim, the side lines of which were inclined, conforming as nearly as possible to the dip of the vein, the miner being permitted to take all the valuable mineral found within 30 feet of the foot or hanging wall of the vein. It is not apparent that the adoption of a similar law in the United States would simplify existing conditions. When gold was discovered in California it quickly became necessary to adopt some code of laws to govern the appropriation and operation of mineral lands in the public domain. In framing the early mining statutes the mining laws of Spain and Mexico were followed to a great extent, and from these, with the customs and usages of the miners, the mining statutes were evolved, with numerous changes from time to time. Among the earliest and most pronounced exception to the Spanish and Mexican laws was that of giving the quartz miner the right to follow all the "dips, spurs and angles" of his vein, to indefinite depth in the direction of its dip, absolutely regardless of the surface underneath which it might penetrate. The first mining laws enacted by Congress were those adopted as the local rules and customs of the miners of California. Later, when mining law became more clearly defined but when, evidently, the knowledge of mining geology was somewhat clouded, the law of the extralateral right was passed—the law of 1866. This law presumably conceived a condition, which, geologically speaking, approached the ideal—a series of veins essentially parallel in dip and descending into the earth at an essentially uniform angle. Unfortunately for the quartz miner, this ideal is rarely found, though not without example. The copper-bearing conglomerates and beds of the Lake Superior region, and the gold-bearing reefs of the Witwatersrand, in the Transvaal, are typical examples. But in a district like Butte, Mont., Cripple Creek, Colo., or Rossland, B. C., where the geology is complex, and where veins strike in various directions, with variable dip and often connected by a system of reticulated smaller veins, the identity and continuity of any particular vein often becomes a matter of great difficulty and uncertainty. This complex geological condition and its bearing on the extralateral right has in some districts been the cause of expensive and seemingly almost interminable litigation.

Despite this there is that about the extralateral right which makes it attractive. While the fact that a change in the law which would operate to confine mine owners to the planes of their boundaries drawn vertically downward would put an end to that litigation over the much disputed right in newly located claims, yet it is a noticeable fact that in those countries where the extralateral right is not in force there is less activity in mining. There is something alluring in the condition which permits a miner to pursue his vein to illimitable depths if he desires, and he objects to being hampered in his search for ore by the intervention of an imaginary line or plane. As a matter of course he is limited by his end line in following the strike of the vein; but this he may overcome by taking up several claims adjoining each other; but stopping at the side line seems different. Owing to the uncertainties of the continuation of payable ore bodies, there is little incentive to sink shafts through the barren hanging-wall country rock to ascertain whether or not a vein successfully exploited at and near the surface will continue to be equally valuable in depth, and, as a rule, where the extralateral right is not in vogue mining is less active than in those regions where the law is in force. Elsewhere herein a correspondent makes a forceful argument in favor of the extralateral right, and argues a deadening effect in a law which limits the pursuit of ore to the boundaries of claims on all sides.

IN the matter of conflicting mineral claims, where the conflict is on paper in the land office only, due to inaccurate surveys, it is now clearly established that the monuments must control, and errors in sur-

veys must be corrected to conform to the facts. Recently, Acting Secretary Ryan of the Interior Department, in one of the Leadville cases involving this question of inaccurate survey which resulted in a conflict of claims on the land office maps, decided that in the designation of the position of mining claims two elements are involved in patent proceedings—first, the course and distance from a corner of the claim to a corner of the public survey, or a United States mineral monument, and the designation of the boundaries by courses and distances; second, by reference to and description of the monuments on the ground, by which the boundaries must be distinctly marked. These different elements should coincide, but cases are many in which they are at variance. With such variance always possible, the mining claimant who fails to mark distinctly upon the ground, before the survey of his claim, the boundaries thereof, with the monuments of fixed and enduring character and zealously thereafter to preserve them intact and in place as they are described in the patent, takes the consequences of his omission.

THE three active months of a presidential year are always marked by a business depression. Timid people and scary business men are always ready during the next ninety days to imagine all sorts of dire happenings and from their number they have a deterrent influence on general business. Those who find profit in panics now do their best or worst to precipitate what they are fond of calling "hard times." Times are always hard with some people, who find excuse for failure outside of their own lack of ability or their own timorous dispositions. Prosperity is based on public credit, and that is primarily a matter of confidence. In the mining world there is more than ordinary activity. Investments continue with profitable result and reports from all parts of the field show that mining machinery and appliances are in usual demand. Indeed, the incipient dullness in other branches of business induces even more than ordinary onward movement in everything pertaining to the mining industry, for, happily, this department of public activity tends to profit by the efforts of a fearful few to predicate disaster. Not in many years has there been more development with just promise of profit, forming a pleasing contrast to other forms of business which at present are temporarily quiescent because of this prevalent habit of dismal prophesy, which every four years partially paralyzes so many enterprises in the business world. That there is no real reason for cessation of prosperity in any department of general business is manifest, but despite this fact the regular quadrennial scare shows itself here and there, to be dispelled as usual when, after the November election, the croakers and Cassandras realize how baseless were their fears.

CRUDE petroleum has been applied to ore reduction in a variety of ways—in chlorination roasting, in ore drying and otherwise, but as yet it has not been attempted in the reduction of quicksilver ores in furnaces of the ordinary type—that is, in upright shaft furnaces such as are employed in the reduction of quicksilver ores. At the Socrates mine, Sonoma county, Cal., crude petroleum has been used in the reduction of cinnabar in the rotary furnace of the White-Howell type, which is the only place where oil has been employed for this purpose as far as known. It is the intention of the management of the New Idria mines in San Benito county, Cal., to make experiments with crude oil in the ordinary vertical shaft furnaces. No difficulty is anticipated in the coarse ore furnaces where the intense flame of the petroleum blast will impinge directly on the ore, but in the fine ore furnaces in which there are numerous arches, ports and baffle plates, the necessity for experimentation is evident. It is thought the application of oil to quicksilver reduction will result in cheapening the cost of the process.

WHERE there are State laws requiring that mines be operated along certain lines—as to timbering, ventilation, etc.—and the management slight these necessary requirements so far as it safely can without actually disregarding the law, the result is usually, sooner or later, a serious accident. If such regulations are considered essential to the safety of men, there should be some means of enforcing the law.

## CONCENTRATES.

A SMALL HAND JIG may be made for testing ores by this method of concentration. These jigs may be bought ready made, with instructions as to method of operating them and testing the ores.

IN Mexico tin is found in the States of Guerrero, Durango, Zacatecas and Jalisco and in the Territory of Tepic. In Jalisco it is associated with copper and iron. Nearly all Mexican tin carries small values in gold, especially that which is known by the Mexican miners as "estano colorado," or red stone tin ore.

IN the "Concentrates" of July 23, in re. the losses of mercury by pan process and subsequent treatment of tailings by the cyanide process, the second chemical equation should have read:  $2\text{Hg}^{++}\text{Cl} + 4\text{KCy} = \text{Hg} + \text{K}_2\text{Hg}^{++}\text{Cy}_4 + 2\text{KCl}$ , indicating the formation of potassium chloride, which was omitted in the former "Concentrate."

THAT there is any actual relation between the value of ores in veins and the formation in which they occur is not demonstrated by experience in the development of mines in many different kinds of rock. The statement that the wall rocks are of this or that character is not an index of the values in the veins. Good mines are found in almost every kind of rock.

THE appearance of metallic copper on the sides of an iron mortar in which copper-bearing ore was being ground in the presence of water was no doubt due to the fact that the ore contained some copper in the form of sulphate, and this being soluble was dissolved by the water and immediately precipitated on the iron sides of the mortar and also doubtless on the pestle.

OCCASIONALLY minerals are found so light as to float on water. Among them are some varieties of pumice, infusorial earth and quartz which has become cellular by reason of the decomposition of the sulphides or other soluble constituents, leaving spaces filled with air, the walls of which being impervious to water, the air has sufficient buoyancy to cause the entire mass to float.

MANY millmen burn the tin screens used in the battery before tacking them to the frame. The burning removes the tin and anneals the iron plate, making a tough and durable screen. The annealing renders the screen much less liable to breaking—a fault not uncommon in brittle screens. The burning can be best accomplished over a moderate charcoal fire. Care must be taken not to overheat the screen.

ASBESTOS is a calcium magnesium silicate. It is purely mineral and in no sense of "vegetable" or organic composition or origin. Its separation in some varieties into silky fibers is a natural property of the mineral, as much as the separation of mica into plates of extreme thinness. Asbestos of good quality is unaffected by heat, and for this reason is utilized in making fire-proof and refractory materials.

IN hoisting engines the brakes should never be neglected. There are several types of band and post brakes, but the post brake is most in favor because of its somewhat heavier construction. The hoisting engineer should at all times know that the brakes of his engine are in first-class condition. It is unwise to allow the shoes to go too long without renewal. On the brakes depends the lives of the men and their failure means disaster.

"CHINESE TALC" is a name given by Leadville, Colo., miners to a white, compact, semi-translucent mineral, found between the limestone and porphyry, and sometimes with the ore in that district. The mineral greatly resembles in appearance the material from which miners' candles are made. It is a silicate of alumina, with usually more or less sulphate of alumina, but is of variable composition. It is hygroscopic (absorbs moisture from the atmosphere), and hardens on exposure to the air.

THE Bunsen method of separating arsenic and mercury is based on the fact that when hydrogen sulphide is passed into an acid solution containing pentad arsenic and pentad antimony, and then the hydrogen sulphide driven out by air under pressure, antimonious sulphide ( $\text{Sb}_2\text{S}_3$ ) only is precipitated. The arsenic is reduced also, but much more slowly; but if the hydrogen sulphide is promptly driven out when the precipitation is complete, a satisfactory separation of the two—arsenic and antimony sulphide—is effected.

AT the last session of the California legislature three companion bills were introduced amending Section 3 of the code of civil procedure, the passage of all of which would have been to render mining claims liable for labor performed on them, and rendering of no effect the notice posted by the owner to avoid responsibility of debts contracted by bonders or others. All of these bills passed and one of them was signed by the Governor before any objection was made to the same, the other two being pocketed by the Governor. The precise effect of

the amending of a single section without amending the other two has not been passed upon by the Supreme Court of the State, and there is every reason to believe that at the next session of the legislature the coming winter the section amended will be restored to its original form, to obviate all doubt on the subject. The act, as it was intended it should be amended, would make it possible for the person having a bond on a mine to connive with several workmen to defraud the owner out of his property under the lien law.

IN Mexico miners are called "mineros," "barretaros" and "trabajadores de minas." In any particular mine the foreman is known as the "minero" and the miners as the "barretaros." The mine laborer is classed as a "peon." The timekeeper is the "rayador" and the mechanic is the "maquinista" or "mecanico." In a small mine the superintendent is called the "administrador." This name is also given to the paymaster of a larger mine. A prospector is a "prospetador" or a "rumbiador." Placer miners and chloriders are termed "gambucinos." Tin miners, both quartz and placer, are called "estaneros."

THERE are a number of laws on the statute books of California relative to mines and their operation, but none relating to safety appliances in shafts. The laws requiring a second means of exit from a mine over 300 feet in depth; the law providing for a uniform code of bell signals, for mines and other similar legislation, have no provisions for their enforcement, but they all depend upon the fact that failure to comply with the law deprives the owner of the mine of a defense in the event of the injury or death of workmen occurring through failure on the part of the mine owner (company or individual) to comply with the law. Thus Section 3 of the Bell Signal law says: "Any person or company failing to carry out any of the provisions of this act shall be responsible for all damages arising or incurred by any person working in said mine during the time of said failure."

ONE atom of copper passing into solution "cyanides" 3.5 to 4 molecules of KCN, forming a cuprosocyanide, probably  $\text{K}_3\text{CuCy}_4$ . As the atomic weight of Cu is practically equal to the molecular weight of KCN, a pound of copper would decompose, as a maximum, four pounds of KCN, or an ore carrying 0.1% Cu might decompose as much as eight pounds per ton. This, however, would be in an extreme case, when all the copper is in an oxidized form, such as the carbonate, when mechanical conditions also favor its rapid dissolving; the sulphide ores, especially when compact, are much more slowly attacked. The cyanogen in this double cuprous cyanide is not shown by the silver nitrate titration and is valueless as a gold solvent. Zinc will precipitate copper partially from solutions which contain but little free cyanide, but not from strong solutions.

THE terms "blanket vein" and "bedded vein" are synonymous. Often veins in crystalline rocks like schist, granite, diorite, etc., which lie at a low angle, are referred to as blanket veins, though originally "blanket vein" was the name given to "beds of ore" which were of chemical origin, as bog iron ores deposited in shallow lakes, etc., and to ore bodies in sedimentary rocks (sandstone, limestone, etc.) as the result of the deposition of mineral in those rocks by mineral solutions. These bedded deposits may be formed in any one of a number of ways. 1. By selective porosity, where the mineral deposits in a porous rock, such as the silver ores of Calico district, California, or of Silver Cliff, Colo., where the ore occurs as chloride in a porous rhyolite breccia. 2. As a residuary deposit, from the evaporation of water containing mineral in solution, such as beds of salt, soda, calcium borate, gypsum, etc. 3. As the result of the replacement of country rock by minerals deposited from percolating waters. Among these are the lead-silver zinc and iron deposits found in limestone, such as those at Leadville, Colo., and elsewhere. The Cambrian ore deposits in the Black Hills are impregnations in quartzite and lime shale, and may properly be considered as typical bedded veins.

WHERE contractors and company employees work in the same mine, complaint of misappropriation of tools and supplies, one from the other, is of frequent occurrence. This can be obviated by stamping tools—such as picks, shovels, drills and hammers—with the company name, these to be given to the company's men, and stamping a different device or none at all on the contractors' tools. At Morenci, Ariz., this misappropriation of tools but more particularly of supplies, led to the expedient of having colored candles made for the use of men on contract, the company's men using the plain white article. The fuse and powder are also marked in some way that it may be readily distinguished. Another idea, often prolific of good results to the management, is the numbering of all the machine drills and keeping a check on the disposition of every drill sent into the mine, its destination, etc. Then if the drill is carelessly broken it can not be taken to the surface, thrown out at the collar of the shaft, for repairs or the junk pile, and another machine taken down, possibly to share a similar fate in incompetent hands. All the wrenches, oil cans and other tools should be numbered to correspond with the drill to which they belong. This plan will often put an end to the petty annoyances of having the men appropriate

tools and supplies belonging to others, and the marking of machines will usually result in the men taking better care of the machines entrusted to their care. Where this has been tried it was found to operate satisfactorily in every case.

A DICHRSCOPE is an instrument used for the purpose of testing the dichroism of minerals. Dichroism is that property of a mineral which causes it to seem to have two different colors when viewed from different directions. Zircon is an example. A transparent crystal of this mineral viewed in the direction of its principal (vertical) crystallographic axis is a pinkish brown, but when viewed at right angles to this direction seems asparagus green. Light-colored tourmalines viewed in the direction of their vertical axis are opaque, and viewed at right angles to the vertical axis show some color. The dichroscope consists of an oblong rhombohedron of Iceland spar with a glass prism of 18° cemented to each extremity. This is placed in a metal case provided with a convex lens at one end and a square hole at the opposite end. When looking through it there appear to be two holes, due to the double refraction of the Iceland spar. When a dichroic or pleochroic mineral (one presenting three colors when viewed in different directions) is examined through the dichroscope, by means of transmitted light, on revolving it the two squares at intervals of 90° in the revolution have different colors, according to the vibration planes of the ordinary and extraordinary ray in the calcite. As the two images are side by side, a slight difference in color is perceptible. The instrument is often employed in the examination of gems.

THE 4-inch pump with 10-inch stroke, operated at Grass Valley, Cal., in which the "water hammer" is causing too much vibration, could be improved by placing an air chamber on the upper part of the pump, in addition to that on the pipe line. The object of an air chamber is to change the intermittent motion of the water moving with the pump piston or plunger into a uniform flow in the discharge pipe, and to reduce the shock of water hammer. Where water is forced through a column pipe by a reciprocating (not a rotary) pump, and where, therefore, the water in the pipe is alternately started and permitted to come to a state of rest, the velocity of flow cannot be allowed to be great; otherwise, the column of water will continue in motion for a short interval after the pump has reached the end of the stroke, and will then start back when the piston is on its return stroke. The effect of this is to cause the outlet valve to close suddenly, arresting the movement of the column of water with the consequent shock. In the pump in question, as the discharge column is but 2 inches in diameter and the pump cylinder is 4 inches, the relative area is as 4:1. Consequently the water moves four times as fast in the discharge column as in the pump—in this case nearly 300 feet per minute. If the additional air chamber, as suggested, fails to stop the hammer, a somewhat larger discharge pipe may help it.

THE NAMES of many of the subdivisions of the geological ages are derived from the name of the locality in which typical occurrences of the rocks were first studied. Azoic means without life, and refers to the earliest Archæan. Archæan means old, being the oldest formation known to geological science. Laurentian and Huronian are divisions of the Archæan; Laurentian being named after the Laurentian hills on the river St. Lawrence, Canada, a typical exposure of the rocks in question, and Huronian is the name given to a large area of ancient schistose rocks near Lake Huron, Canada. The Algonkian rocks were formed during a period intermediate between Archæan and Cambrian, and was named from a once powerful tribe of Indians that wandered from the Carolinas to Hudson bay. The typical exposures are near the shores of Lake Superior. Silurian is from the ancient Silures, a Celtic race, who at one time inhabited Wales where these rocks are prominently exposed. Cambrian is the lowest member of the Silurian, though sometimes separately considered, and is named from Cambria, the ancient name for Wales. Devonian is from Devonshire, England. The Carboniferous is named from the large amount of carbon (the coal measures) occurring in certain localities in some portions of the rocks of that age. The Jurassic (usually called the Jura) is named from the Jura mountains, between France and Switzerland. The Triassic is from the Greek, meaning three, in consideration of the three distinct divisions of this formation in Germany. The Jurassic and Triassic are usually considered together as the Jura-Trias. The Tertiary means the third (in point of classification). Formerly the Mesozoic, which includes the Jura-Trias and Cretaceous, was known as the secondary period. The Paleozoic—the period of old life—includes the Cambrian, Silurian, Devonian and Carboniferous. The Permian is the uppermost division of the Carboniferous. All of these divisions of geological time, together with the numerous subdivisions, will be found in any geology, unabridged dictionary or encyclopedia. Rock formations are usually identified by the remains of plant or animal life (fossils or fauna) contained. These are known as fossils. Where fossils are absent, the classifications are generally made on lithological grounds. The latter has led to many disputes among noted geologists in the identification of the older crystalline rocks and in some instances a certain confusion of identity and names, as, for instance, the relation of the Algonkian to the Archæan.

## Mining Potentialities of the Zambesi Valley.\*

Written for the MINING AND SCIENTIFIC PRESS by  
THEO. F. VAN WAGENEN.

The geography of South Africa, from the Zambesi valley to the Cape, is simple. A chain of mountains, ranging from 2000 to 8000 feet in altitude, and from 40 to 100 miles in width, follows the coast line clear around the sub-continent. In places it is within a short distance of the sea, as around the Cape, while elsewhere it lies from 10 to 50 miles or more back from the shore. The greatest elevations are on the Indian ocean side, back of Delagoa bay, where altitudes of 8000 or 9000 feet are attained. The lowest are on the Atlantic side, in German West Africa. Within this rim is a vast table-land, the higher parts of which are naturally at the base of the most elevated points of the circumscribing mountains, and from them slope away gently and almost imperceptibly to the west and the northwest. Innumerable minor ranges of hills rise from the surface of this plateau, but they are of insignificant height, are rarely persistent in length for over 100 miles, and are generally little more than mere crumpings of the crust of the earth. A hill, or range of hills, with an extreme altitude of 1000 feet and a length of more than 20 miles, is a notable projection upon the face of the South African upland.

At the broad southern end of the continent the great enclosing range is parted into several parallel ones, forming valleys between, or stretches of semi-upland. The Karoo desert is one of the latter, simply a rather long shoulder on the north and south profile of the continent.

Through this semi-circular rim three large rivers have cut their way from the interior to the sea—the Orange, which rises at the western base of the high range along the east coast and flows into the Atlantic; the Limpopo, heading in the same region and flowing at first westward, then northward and finally eastward and falling into the Indian ocean, and the Zambesi, which derives its main sustenance from central Africa, but also has a few strong tributaries coming in from the uplands north of the Limpopo. The Zambesi also empties into the Indian ocean. Thus the South African continental divide is a very sinuous line. It begins at the southern ocean about midway between Mossel and Algoa bays, and running north joins the main range at Beaufort on the edge of the Karoo. From there it follows its crest northward for a thousand miles to a point about midway between Delagoa bay and Pretoria, where, turning sharply to the west, it runs directly through Johannesburg and passes away between the upper tributaries of the Orange and Limpopo and along the east side of the Kalihart desert to the northwest and around the headwaters of the Zambesi.

These geographical conditions have had much to do with the slow progress of settlement by Europeans. Of the three rivers mentioned only the Zambesi is navigable for a considerable distance from its mouth, and for many years a safe entrance through its delta was unknown. Consequently the country had to be conquered by the deliberate methods of overland occupation. The lands at the southern end of the continent were naturally at first taken over. From these settlements slowly spread northward through and across the hills into the headwaters of the Orange river, forming the Orange Free State. Later the emigration advanced across the Vaal into the table-lands around the sources of the Limpopo, forming the Transvaal colony, and, still later, but along a more central route, into Rhodesia, which is practically such parts of the Zambesi valley as had not meantime been occupied by the Portuguese, who for over three centuries have claimed the regions around its mouth.

Rhodesia consists politically of two divisions, viz., southern Rhodesia, extending from the Limpopo northward to the Zambesi and covering an area about as large as Montana, and Northern Rhodesia, which includes the country north of the great river to the divide of the Congo on one side and the basins of the great lakes on the other. This area is about as large as the State of Texas.

Beyond a doubt South Africa is to become one of the great mining regions of the world, and to those Americans who are looking this way for professional work a correct understanding of the main topographical features of the region will not come amiss. This will be my excuse for the foregoing rather extended geographical statements. We who have done much wandering among mineral regions know that the trend of mountain ranges and divides and the general lay of the land has more or less bearing on the question of commercial success. Many will object to the statement that the country is "to become one of the great mining regions of the world" on the ground that it has already attained that position. So far as gold and diamonds are concerned, the objection holds good. But nearly all of the precious metals and gems come as yet from only two small points on the map—Johannesburg and Kimberly. The remainder of the

vast region, excepting a small part of Rhodesia and a little spot near the southwest coast where copper has been found, is almost totally unprospected. The Johannesburg mines are now yielding gold at the rate of about \$70,000,000 per annum. The diamond product foots up about \$25,000,000 in value; the Rhodesian gold mines are outputting about \$5,000,000 and the Cape copper field under \$500,000 worth of the red metal. If these represent all the mineral wealth of South Africa, the country will certainly flourish for a time, but only for a time. My opinion of its future, however, is based upon the indications and knowledge of abundant resources in other mineral substances, and to call attention to them is the main object of this paper. Gold and diamonds are good, but the history of all mining regions shows that more true and permanent prosperity results from the production of the base metals and of the long list of other mineral substances that are of economic value.

Very little is known of the geology of the sub-continent, except at a few scattered points where local investigations have been made. Writing broadly, one may say that the uplift along the eastern side has been sufficiently pronounced to bring a long line of the deep underlying granites and the Archæan schists, gneisses, etc., to the surface; while elsewhere, and particularly along the west coast, the mountains are made up of the later sedimentaries. Between the two there has been enormous erosion, which has carried away the bulk of the secondary and Tertiary rocks. The trend of this erosion has been to the Zambesi valley. At one time that valley (or much of it) has been a vast fresh water lake, or an arm of the sea. As its bed was filled up by the debris poured in from the south, it gradually assumed its present form and outlines. In the valley are very extensive areas of basaltic flow, one of which has caused the Victoria Falls, which is a remarkable natural phenomenon. But, in spite of the great erosion and degradation that has taken place, enough of the mineral-bearing rocks and formations remains to furnish work for the modern miner for many centuries. One can not help thinking, however, of the vast amount of good stuff that has been swept away through the ages via the Zambesi route into the Indian ocean, where it is now wholly beyond reach. We should have come here a few million years earlier.

To the traveler with a penchant for archæology and the pre-historic, there are overwhelming evidences that the valley has at some period of the past been very extensively prospected by a race of people searching for gold, and that a vast amount of the metal has been taken away by these ancient miners. Some South African, with a statistical turn of mind, has attempted to cipher out what has gone, basing his calculations upon the size of the excavations that have been found, and has arrived at the figure of \$375,000,000 or thereabouts. I am not yet sufficiently posted to either controvert or confirm this conclusion, and will simply turn it over to the reader for digestion at his leisure. The Portuguese were the first of modern people to enter the region. In 1498, I think, Vasco de Gama made his first memorable trip from Lisbon around the Cape of Good Hope to India, and early in the following century landings were made at several points along the east coast to the north and south of the mouth of the Zambesi, where several small Arab settlements were still existing, and to which every year small quantities of gold were brought by the natives of the interior to be exchanged for such wares as the traders had to offer. A glance at any good map of Africa will show that the Zambesi escapes from the continent between two rather notable mountain masses, viz., the Blantyre highlands at the foot of Lake Nyassa, and the Manicaland range, culminating in the Inyanga hills. Between the foothills of these two summits the valley is contracted to a width of less than 30 miles. Once past them, it broadens out into a vast area of low-land and flats constituting the delta. This delta is occupied by tribes of blacks that differ in physiognomy and language from all others in Africa. Instead of being black in color, they are distinctly brown and even yellowish brown. Their features are a great improvement on those of their neighbors towards the interior, and their profile has often a Semitic cast. Their language contains many Arabian words and forms, and altogether the conditions indicate centuries of association and admixture with whites from western Asia, combined with a long period since their departure, during which the original negro strain has been recovering itself. According to both history and tradition, the Arabs have for at least 3000 years past traded down the west coast of Africa, and one of the chief articles carried back to the north was gold. During those far away centuries when Tyre and Sidon, and later Alexandria, at the mouth of the Nile, were the financial centers of the nations, this trade was not only a large one, but South Africa must have been the only part of the then known world that was yielding the metal in any considerable quantity. At any rate, history does not point out any other place. But from the time that the wand of commercial supremacy crossed the Mediterranean to Venice, the bullion trade of Alexandria began to decline. During the Middle Ages Africa was almost forgotten by the nations, and certainly the geography of its east coast was unknown to Europeans. When, therefore, the Portuguese rediscovered it, few traces remained of its former importance. But what did remain, and

what could be ascertained, indicated points in the interior back of the coastal mountains where mysterious architectural ruins and vast mining excavations existed. The tales of these inspired the Portuguese to explore. Such of their records as have come to light tell of a number of expeditions into the Zambesi valley in search of the fabled gold mines, and of genuine and interesting discoveries of apparently very old human structures and great excavations along the croppings of quartz veins, all of which reports have since been fully confirmed. There is no doubt that the Portuguese made great efforts during the earlier period of their occupation of the coast to revive the industry of gold mining, and that they met with some success. A number of their forts, cannon and muskets have been since found at scattered points of the interior. But the general incompetence and brutality of the Government officials of that day soon roused the hostility of the natives, and in a short time the explorers were driven back to the sea shore. Unfortunately, the records of these expeditions were either very badly kept or have been lost or are still buried among the mass of Government archives in Lisbon.

Twenty-five to thirty years ago tales of these ancient structures and diggings began to come to the English and Dutch settlers in Cape Colony, and in 1885 a deal was made by some friends and business associates of the late Cecil Rhodes with the principal native chief of the region, one Lobengula, by which the latter sold to the whites the mineral rights of the region. Following this a party of occupation came up from the south and took possession. In due time, as is usually the case with such matters, conflicts arose between the whites and the natives, which resulted, after much bloodshed in the defeat and subjugation of the latter. Meanwhile Mr. Rhodes and his friends had organized the British South Africa Company, which, under a charter from the British Government, took over the administration of the country and has since retained it. The capital of the province is at Salisbury, where the chief governing officer, known as the Administrator, resides. There also resides the High Commissioner, acting as the representative of the English Government. The laws of the country are in the main the same as those that are at the foundation of the structure of Anglo-Saxon communities in all other parts of the world, but with some notable and fundamental differences. The country is actually owned by the administering company, colloquially called "The Chartered Co.," or, more briefly, the "Charter," who have been granted by the Imperial Government the right to dispose of the lands, mineral deposits and other natural resources and franchises very much as they saw fit. The results are not always satisfactory. The land is nominally open freely to the farmer and miner for occupation and usage, but the regulations and restrictions connected with the processes of settlement and occupation are often so complicated and onerous that commercial success in mining or almost any line of business is an extremely difficult achievement. For mining, prospecting licenses are required, and a rather stiff annual fee (about \$125) is necessary to keep claims current, besides which the Government retains an interest. This interest can be commuted upon flotation of the property into a company by giving the "Charter" a goodly slice of the vendor's stock; but if the owner does not care to capitalize his property and wishes to work it himself, he has to do a large number of bothersome and complicated things precedent to and during such a course, which, in most cases, effectually deters him from making the attempt. No fee simple title of any kind is obtainable for any class of realty. There is always some form of perpetual quit rent that must be paid. There is a procedure for mining claims, that is akin to our patenting proceedings, which is called "special registration." But, after one acquires it, the costs of maintaining the title are just as much as they were before; so that its advantages are not always apparent to the naked eye. In the early days of the country much of the best land was given away to the great mining companies that were organized, and while the miner can prospect and locate claims on these farms, many of which cover hundreds of square miles, he has to pay the land owner for his fuel and mine timbers. The water laws are also involved and difficult to get any satisfaction from. This is due to the fact that in such matters it has been decreed that the old Roman-Dutch law should govern in place of the English common law. As a consequence of these unfavorable conditions, there is little if any place in the scheme of things for the individual miner or the small capitalist. Those who framed the laws evidently did not contemplate him as a necessity or a probability. The capitalist and the company were believed to be more desirable. It was thought that the native would be the laborer and that the white workman could be dispensed with. The result is that Rhodesia presents the singular spectacle of a country without a laboring class; for it would be a joke to call the black man, even at his best, a workman. One white American or Canadian or Australian miner, applying his brains as well as his muscle, will do as much as ten of them. In some of the mines, which in other lands would have a force all told of 100 to 150 men, one finds it necessary to employ 50 to 75 whites as underground and surface bosses, and then from 1000 to 1500 blacks to keep, for instance, a 40-stamp

\*See illustrations first page.

mill in ore from a 3-foot lode. Operating expenses are therefore enormous.

It is only right to say, however, that the Rhodesians are waking up to the discouraging conditions under which they have to operate, and are making strenuous and successful efforts to change them. The laws are being altered as fast as the Government can learn of and understand the disabilities they impose upon the community. The fact is already well recognized that the individual makes a far better foundation for a nation than companies and capitalists, and steps are being taken to attract him by throwing open the resources of the region to his enterprise. The example of Canada is being watched with great interest, and those of the citizens who have the future of the country at heart and propose to establish a home in it, as well as the Government, are making a study of the mining laws of other lands with the idea of incorporating into the Rhodesian statutes all those provisions that have been found to work well elsewhere. An example of this is the fight that occurred in the Legislative Council a year ago to prevent the deletion from the law of the principle of the "extralateral right" for lode claims. By good fortune this provision existed from the first in the law, but certain interests sought to eliminate it. We have men among us who would do the same for the American law if they could. To such I would say that it is only necessary to live in a mining region where vertical boundaries prevail and observe the deadening influence on the community, to become a convert to the other system, in spite of all the legal difficulties it involves. And by the way, right here let me say that one of the very best possible advertisements that a mining camp can get, is a real, first-class, twenty-story, steel-frame, lawsuit.

At the base of every healthy mining community is the prospector, as an absolute necessity. And the prospector can only be induced to work actively in those places where he can own (solely and indefinitely) what he finds. The Western States of America (including Alaska), and Rhodesia, are the only two regions of the world, so far as I know, where the extralateral right of pursuit of lodes exists, and the former is the only nation possessing the prospector in real numbers. Rhodesia would have him also if the remaining provisions of the law were equally liberal—as they will be shortly. Compare the army of prospectors, fully 100,000 strong, that starts out each spring to search over the public lands of the West and Alaska, with the insignificant numbers of the same class abroad in British Columbia, the Northwest Territory, Mexico, Australia, the Transvaal, New Zealand and the Andean regions of South America. Compare the number continually at work in New Mexico with the few who are to be found in Texas, where claims have vertical side lines; those who are at work in northern Washington, Idaho and Montana, with those in British Columbia just across the line; the thousands that are tramping over the frozen surface of Alaska with the hundreds that may possibly be exploring the British Northwest Territories, and the wisdom of paying his price to the prospector will be at once apparent. That is, for those States that really wish to have their mineral resources discovered. I venture the opinion that if the American prospector were turned loose in Spain, with the same rights and opportunities he has in the Western States, he would transform that hoary old mining region in a dozen years into the richest and most prosperous corner of Europe.

So, by a lucky chance, the Rhodesian mining law contains the germ of success and prosperity, and this germ will sprout and bear fruit as soon as other conditions are made equal, for the land contains mineral resources of the best kind. Not by chance, but because of its inherent merit as a mineral field, were the ancients attracted here centuries ago. Whether or not it was the real, old, original "land of Ophir" from which King Solomon, assisted by his chum Hiram of Tyre (and no doubt Hiram Abiff was also of the firm), obtained the gold that gilded the dome of the Temple of Jerusalem may never be known; but the fact remains that in the region between the Limpopo and the Zambesi wherever the Archæan schists and gneisses are exposed they are found to be charged between their bedding planes with thousands and thousands of quartz lodes (here called "reefs"), and where these appear on the surface and have been softened and decomposed are remains of excavations dug by some people in the far past, and pushed down into the earth until either the zone of free ore was passed or water in unmanageable quantity was encountered. A few of these have been found to extend to depths of 100 feet or more, but the majority are under 50. They range in length from a few feet up to several hundred, and in width from 10 to 30 feet. All are more or less filled up with debris washed in from the surrounding country by the rains, and but for the banks of broken quartz alongside, and the fact that they follow each other along well-defined straight lines, marking the strike of the veins, might often be supposed to be simply natural depressions. (See illustrations on front page.) When these old excavations are cleaned out the quartz lode is found in the bottom ends, and with often a thin but continuous layer of charcoal lying upon it, showing that the method of working was by building fires against the rock and afterwards throwing water upon it. No tools of iron or other

metal have been found, but stone hammers (or mauls) are often picked up. These are of quartz or diorite, about as large as the double fist, well rounded, and apparently were held in the palm of the prehistoric miner and so used to batter down the shattered rock. Human remains such as bones or clothing are never found, though many individuals must have perished by the caving of the walls or through other accidents. The roughly broken quartz, after being carried to the surface, was evidently first sorted over very carefully and the fragments of low value disposed in long piles by the sides of the trench. Many thousand tons of these waste heaps have been milled by the modern miner. They may generally be relied upon to yield from \$3 to \$5 per ton. The richer portions were evidently carried a little distance away and distributed to individuals (perhaps women), whose part it was to grind the quartz to a powder so that the particles of gold were freed. This was done on slabs of hard diorite 18 inches to 2 feet long and half as wide, on one face of which a shallow depression would be made by grinding out with another stone. In this depression a handful of quartz at a time could be pulverized. Around all the ancient workings these grinding stones can be found in great quantity. Finally—at the nearest water, no doubt—the metal was washed from the pulp.

At a few places the remains of old smelting establishments have been found. These are great curiosities, and seem to indicate that a class of workmen existed who were acquainted to a certain extent with the art of recovering the gold from pyritous ores. They accomplished this in cylindrical clay crucibles 10 to 12 inches long, 2½ to 3 inches in diameter outside, and with a bore of 1¼ to 1½ inch. The vessel was, of course, closed at one end. A half dozen or so of these would be assembled in a bundle while moist, so that they would stick together, and when dried each crucible was filled with a mixture of ground pyrites and quartz, and the bunch so charged was made the center of a charcoal fire. Presumably the ancient metallurgist surrounded his fuel with a ring of stone, and urged its combustion with a skin bellows. In due time the charge would melt, a slag would form, and the gold, settling through it, would accumulate at the bottom. When the operation was complete and the crucible was cold, a tap on the base of each would break it off and reveal the little golden button that had settled there. At one place that I visited the ground for an acre or two in extent contains thousands of these bunches of crucibles, each with its end chipped off and its shaft still filled with the cylinder of slag. Evidently such a spot was a branch establishment of the genuine, original "smelter trust." If I could have found some evidence among the ruins of a "zinc penalty," the identification would have been complete. But perhaps the microbe of that original sin of the modern metallurgist had not at that time become active. I have tested the slag in several of these pots and found it very clear of gold. The African smelterman, like his modern successor, was an adept at his work.

At many points throughout this gold-bearing country are remains of old buildings, possibly forts, or central collecting stations. What remains of the walls shows considerable architectural skill, but the use of mortar was unknown. The largest is called the "Great Zimbabwe," and within its extensive enclosure several hundred thousand dollars worth of little golden beads and tacks have been washed out of the accumulated debris of the centuries. The structure is beyond question over 2000 years old, and how much more no one can tell. (See engravings front page.) A few inscriptions have been found and recognized as Himyaritic, and the style of architecture resembles in many points those ruins that still remain along the southern coast of the Arabian peninsula that are attributed to the Himyarites, a people who antedated Admiral Noah by several centuries, according to the authorities.

But what of the present? While the climate of Rhodesia is the most perfect that can be imagined—for I have not seen either a hot nor a cold day during the two years of my residence—the scenery is rather monotonous. According to our western conception of things, mines should only occur in mountainous regions, places where Mother Nature has had "throes" and has suffered more or less in the way of uplifts and contortions. Doubtless she has enjoyed some of these sensations here, but there is little evidence of it so far as the surface goes. Here and there are small hills, or ranges of them, but quite as many of the mines have been found on the flats between them as on them, if not more. Adit or tunnel work is rarely possible. Shafting is called for at once, and water may be expected within 100 feet. On the other hand, the mines are almost invariably dry below 400 feet. The bedrock in the gold-bearing regions is generally a hornblende schist, between the bedding or cleavage planes of which are lenses of auriferous quartz. These schist areas are generally bounded on all sides by uplifts of gray granite (in which no veins occur) and are of all dimensions, from 1 to 50 square miles in extent. Generally the Archæan rocks are tilted up at a high angle, giving the veins a steep dip. Usually—one might almost say invariably—there is a dyke or boss or intrusion of dark-blue diorite in the vicinity, which faults or disturbs the vein, causing the ore shoots to be of moderate length; but explorations have shown so far

abundant stability in depth, several of the mines having already been pushed down to 1000 feet and over. I have not yet seen any fissure veins in the true sense of the term, but the lodes give every promise of permanence and a few carry payable lenses of good average length (500 to 700 feet). Taken as a whole, however, it is a country of small mines, or rather short ones, but when the vast number of these outcropping lenses are considered, all deficiencies as to length may be safely overlooked. They are simply innumerable. A few spots in our West (like Gilpin county, Colo., for instance) can match their profusion, but only a few. The surface wash is generally less than 5 feet deep, and so the veins are easily discovered and traced. Within certain definite areas, known as the gold belts, the soil will always yield gold to the pan, and the debris consists mainly of vein quartz, much of which could profitably be milled. There are miles and miles of payable croppings in small patches 100 to 300 feet long, separated by other miles of unpayable "bull" quartz, which is here called "buck" quartz. Thus the country should be a perfect paradise for the individual miner and custom millman, and it will be as soon as the owners modify the laws so that they can operate. And here and there Nature has planted out a long and wide lens of good ore, or a succession of them, which affords the basis for a good company proposition, but, as elsewhere, these opportunities are few, as compared with the vast number of little things that cannot be handled under the complicated and expensive methods of corporate management.

Some, who I think must have examined the country in a cursory sort of way only, believe that the ancients have discovered it all, and that there is no room for the modern prospector. With this view I do not agree. I have personally seen a number of good and obvious chances that were entirely overlooked by them. Though they must have been here in great numbers, or through a very long time, to accomplish what we find, they were most casual and ignorant miners and missed many good pockets that have since been found and that were covered by only a foot or two of dirt. They had some faculty, however, as placer operators, for there are regions where the surface soil over hundreds and even thousands of acres under and alongside lines of outcropping quartz and in certain river valleys has been turned over and washed for its golden sands. But the amount that he has left and that is most easily available is enormous. I have seen much country that could be gone over with a plow and scraper, and the surface wash put through a mill or sluice box with profit, if the laws permitted of the operation. In time they will; in a short time too, for the citizens of a country belong to a race that works and succeeds as soon as the conditions permit of the exercise of energy and enterprise.

The list of Rhodesian mineral resources contains many items besides gold. Iron exists in great abundance and of good quality. Numerous coal beds have been found, and more will be reported as soon as the prospector can secure transportation for his product. This is at present an impossibility because the railroad lines are Government monopolies, and the Government itself is interested in coal mining. Enormous deposits of copper ore have been found in the divide between the Zambesi and the Congo, and on the ridge between the Zambesi and one of its main branches, called the Kafue. Argentiferous lead and zinc ores have been located in quantity at several points. Nickel has been discovered; tin is reported, and there are strong indications along at least one long range of hills of platinum placers. But there is not a single active prospector in the land. Vast areas have never been even looked at by the few that were here in the early days. Mineral oil is one of the certainties of the future. There are regions of the province now called desert that will turn out as rich as the forbidding parts of Arizona and New Mexico did when lines of communication were opened across them. So far the companies that have been organized to operate in the country have confined their attention wholly to gold, just as was the case in the early days of the West, and the only scheme of ore treatment that is known of is the stamp mill and the cyanide tank. But now at several of the mines sulphides are beginning to appear, and the ore is becoming rebellious, as we used to say in the West thirty to forty years ago. Concentration is, therefore, in order, but it will not pay to ship anything but a high-grade product to Swansea or Germany, so affairs are gradually approaching a deadlock. Coke and carbonates are wanted, as with us between 1870 and 1880, to constitute the working basis for a smelting industry. Both are here, and will appear just as soon as the laws and conditions will permit of their manufacture and production.

In a review of the mineral resources of the Zambesi valley, something should be said of the Victoria falls, for in time a part of the energy there going to waste will be employed, directly or indirectly, in exploiting them. For miles above the cataract the great river travels along the floor of a broad and almost level valley, the bedrock of which is basalt. Its course is from west to east, its width nearly a mile, and its depth from 10 to 20 feet during the flood season. Directly across the channel there must have been at some time in the remote past a dyke of some softer rock, with a width of 100 feet or

more. This has been bodily mined away by the continual flow of the water, till now there is simply a deep gash 150 to 200 feet broad and 300 to 400 feet deep clear across the channel of the stream. Into this chasm the water plunges and disappears, and when you examine the place where it should be traveling and where it undoubtedly did travel at one time, you find simply a narrow, tortuous and deep gorge 300 to 500 feet wide leading away eastward from the gash into which the water has fallen. At its bottom is the foaming stream, a wonderful and terrible sight as one looks at it from the brink of its nearly perpendicular walls. The very gentle slope of the valley at this part is proven by the fact that the gorge is over 30 miles long before it ends, and the water again spreads itself out and assumes the habits of an ordinary river. It will not be so easy to harness the Victoria falls for the services of the future South African, but it can be done.

To sum up, Rhodesia—the Zambesi valley—is one of the coming great mining regions of the world, in spite of the tremendous disappointments that have so far attended its development, and which have been caused almost entirely by trying to organize and operate the country under the same laws, systems and methods that were employed at Johannesburg. Moreover, the valley, though it lies along the 16° of south latitude, is for the most part a true white man's land, and certainly so as to its uplands where the mining regions are. Even as far north as the Congo divide and the Lake country, the altitude and the distance from the sea make the climate cooler than that of many parts of our own southwest, and far more bearable than central, western and northern Australia. It has but one great drawback, the curse of the unfortunate black man, the influence of an inferior and servile race in such numbers that their extermination is an unlikely eventuality, while their civilization is perhaps the most tremendous human problem at present before the world. On the other hand it is a problem that is thoroughly worthy of the splendid innate qualities of the Briton, and one that he will solve, or die in the attempt. Those of us who have watched the Englishman at his self-imposed task of reclaiming the waste places of the earth and the inhabitants thereof, though we may at times differ somewhat with the methods he employs, have almost unlimited confidence in a successful outcome.

### Production of Coal in 1903.

Returns made to the United States Geological Survey show that the United States has again exceeded all previous records in the production of coal. The forthcoming report on the country's coal production, which Statistician E. W. Parker will soon make, will show that the total output of the coal mines of this country in 1903 amounted to 359,421,311 short tons, an increase of 57,830,872 short tons, or 19%, over the production of 1902. The coal production of the United States in 1903 by States was as follows:

State.	Total Product.	Total Value.
Alabama.....	11,832,124	\$ 14,374,746
Arkansas.....	2,293,593	3,372,536
California and Alaska.....	105,620	306,118
Colorado.....	7,689,308	9,109,810
Georgia and North Carolina.....	434,240	546,759
I Idaho.....	13,250	13,250
Illinois.....	37,206,667	43,559,691
Indiana.....	10,906,812	13,367,859
Indian Territory.....	3,517,388	6,386,463
Iowa.....	6,852,686	11,304,638
Kansas.....	5,867,308	8,930,271
Kentucky.....	7,431,016	7,877,382
Maryland.....	4,783,083	7,084,453
Michigan.....	1,410,909	2,787,742
Missouri.....	4,303,332	6,913,444
Montana.....	1,505,576	2,472,822
New Mexico.....	1,543,466	2,105,885
North Dakota.....	301,105	456,315
Ohio.....	25,004,893	32,195,275
Oregon.....	91,144	321,631
Pennsylvania.....	103,271,057	121,832,439
Tennessee.....	4,797,346	5,978,555
Texas.....	926,758	1,505,383
Utah.....	1,681,409	2,036,038
Virginia.....	3,511,307	3,305,149
Washington.....	3,196,273	5,384,939
West Virginia.....	30,250,408	34,758,490
Wyoming.....	4,709,393	5,916,351
Total bituminous.....	285,107,393	\$354,154,285
Pennsylvania anthracite.....	74,313,919	152,036,448
Grand totals.....	359,421,311	\$506,190,733

Of the thirty States and Territories which contributed to the output in 1903, increased production over 1902 was shown in all but four. Two of those in which the production decreased were among Eastern States, Maryland and Georgia, and two were in the Rocky mountain region of Colorado and Montana.

THE next meeting of the Society for Western Chemists, Assayers and Metallurgists will be held in the Chamber of Commerce, Denver, Colo., on the 15th inst. This organization was first proposed last March and a preliminary meeting held on April 29, 1904. Since that time a charter membership of 400 has been secured, and the purpose of the present meeting is the adoption of a constitution and by-laws. It is the intention to publish a journal of proceedings. The move should meet with hearty and practical co-operation.

COPPER ORES containing gold with galena, pyrite and blende may be concentrated. It is sometimes advisable to hand-pick the copper ore, and then roast the remainder and treat with magnetic separator to remove zinc.

### Recovery of Bullion From Zinc - Box Sludge.\*

NUMBER II.—CONCLUDED.

Written by E. H. TAYLOR.

One experiment, wherein was used no borax, but niter = 90% and sand = 45%, yielded a mixture which fused only very imperfectly even at the highest temperature of the wind furnace.

In another experiment there was used niter = 55% and sand = 40%, with the same result.

In both cases the percentage of sand and niter was so adjusted as to yield slag containing 33% "acid radical."

TABLE I.

Reference Number.	Weight of Sludge, Avordupois Pounds.	Fluxes Used at Roasting.		Fluxes Used at Smelting.		Bullion Produced.		"Slag Values."

	52.5	10	15	10	30	65.0	31.1	21.0	15.8																
	52.5	10	15	10	30		23.9	12.0	13.6																

All the preceding determinations of "finenesses" and "slag values" were made at the assay office of the Great Boulder Perseverance G. M. Co., Ltd.

With reference to Table I, results 2-25 are those from successive cleanups during the past several months, and in every instance the material was passed through a 300 mesh screen prior to smelting.

Generally speaking, the results show, regardless of variations in the relative amounts of the fluxes used, that the proportion 1 flux : 1 "base" in sludge is too low in flux, slags of high "values" being produced consequent upon more or less imperfect fusions.

That the "finenesses" show only constant relative variations tends to emphasize the fact that in all instances the zinc must have been fairly well oxidized, regardless, seemingly, also of the percentage of niter used.

As the proportion increases to 2 flux : 1 "base" in sludge, so practically do the "slag values" decrease. A comparison of the average of results 8-12 = 13.1 ounces of fine gold per ton slag, with that of results 13-25 = 7.3 ounces, discloses the possible fact that, even within very small limits, the percentage of "acid radical" has a material bearing upon the resultant "slag values," manipulations being practically similar throughout.

In the case of results 8-12 the average percentage of "acid radical" in the slags = 31.7, and in the case of 13-25 = 33.8.

The "fineness" of bullion does not seem to be materially affected within such small limits, as the average "fineness" in both cases = 975.

At the time of obtaining the results in Table II there was no sludge filter press available, and in consequence acid treatment prior to roasting was not applied.

This accounts for the presence of visible "short zinc" in the two operations.

As regards Table III, results 1 and 2, operations were carried out on the sludge produced at a cleanup, and divided into two equal portions and treated side by side throughout.

Results 3 and 4 were obtained at another cleanup, the sludge being divided into two equal portions as before.

Regarding the screens used in operations (Table II), the material, prior to roasting, was passed

through a screen with meshes as indicated, except in the case of 4, which was passed through a 64 mesh screen. Then, after mixing, and prior to smelting, all material was again passed through screens with meshes as indicated in table.

All things considered, then, the results prove that a set of conditions whereby bullion of a high degree of "fineness" and slags of "low values" may be produced is:

1. That the material should be well oxidized.
2. That the proportion of flux : "base" should be not less than 2 : 1 (the contained borax not less than 35%), and so arranged that the percentage of "acid radical" in the resultant slag be not less than 33%.
3. That all material prior to smelting should be passed through a screen with at least 300 meshes per square inch.

### The Ore Deposits of Bisbee, Arizona.\*

NUMBER IV.

Written by F. L. RANSOME.

In the present workings of the Copper Queen mine the bulk of the cuprite occurs in the earthy condition mixed with limonite, pure crystalline masses of any size being comparatively rare. In stope 27, in the southwestern part of the mine, just above the second level, distinctly crystalline cuprite was noted, associated with limonite, malachite, brochantite, melano-chalcite and a little quartz. At the time of visit this was the only place in the mine in which any quantity of the mineral was seen in other than the prevalent impure earthy matter.

In the Calumet & Arizona mine, however, new stopes had been opened in ore bodies containing cuprite in large crystalline masses, usually associated with native copper, and in beautiful druses of ruby-red isometric crystals, usually in the form of simple cubes, or of cubes modified by the octahedron and dodecahedron. It is particularly abundant in the fine stope on the 950-foot level about 650 feet northeast of the shaft, where it occurs in glittering bunches in the more earthy ore, penetrated by dendritic masses of bright metallic copper and spotted with little vugs of acicular malachite. It has been found also on the 850-foot level in irregular bunches surrounded by melano-chalcite, chrysocolla, malachite and calcite.

TENORITE.—The crystalline form of the black oxide of copper was not observed in the course of the present investigation. The earthy variety, however, commonly known as melano-chalcite, occurs in some of the soft clayey ores, usually mixed with the black oxide of manganese in the form of a light sooty powder. Ore of this character containing about 5% of copper was observed on the 1000-foot level of the Lowell mine. In the Calumet & Arizona mine, about 30 feet above the 850-foot level, there is a natural cavern in the limestone, whose damp walls are covered with a black moss-like botryoidal growth. This material is apparently still being deposited, for the fragile stems of the dendritic efflorescence break off by their own weight when they reach a length of over ½ inch, and the floor of the cavern is deeply covered with a fluffy carpet of this black material. Inspection of the walls shows that they are composed of alternating irregularly overlapping layers of the black efflorescence with druses of calcite. Chemical tests of the black material, made by W. F. Hillebrand, show that it is a mixture of the oxides of copper and manganese, probably melano-chalcite and bog manganese, or wad. According to Foreman J. G. Merrill, some of this mixture contains as much as 15% of copper.

Koenig in 1891 described some small black crystals from the Copper Queen mine, and concluded that they were essentially a mixture of cupric and cuprous oxides, and were tetragonal in crystal form. He considered that they represented a distinct mineral species, for which he proposed the name paramelaconite. It appears, however, that more chemical and crystallographic work is necessary before paramelaconite can take final rank as a species distinct from tenorite, the crystallographic symmetry of which is still in doubt.

FOOTEITE.—This mineral, a deep blue chlorhydrate of copper occurring in minute monoclinic prisms implanted with paramelaconite on limonite, was first described and named by Koenig, from a specimen said to have come from the Copper Queen mine. Footeite is evidently a rare occurrence in the Bisbee mines and was not seen in 1902.

GANGUE MINERALS.—Of the various minerals associated with the ores, calcite, in its role of principal constituent of the limestone in which the important ore bodies occur, is the most abundant. It is seldom, however, that the mineral forms so large a part of the altered limestone in the immediate vicinity of the ore as it does of the unchanged rock in which mineralization has not been active. As will presently be shown, it has been largely replaced in the process of mineralization by pyrite, amphibole, pyroxene, garnet, chlorite, quartz, vesuvianite and other minerals.

In the form of stalactites, often beautifully colored with salts of copper, and in showy crystalline masses, calcite was abundant in the bodies of oxidized ore

\* Report Chamber of Mines, W. A.

\* Abstract Professional Paper No. 21, U. S. G. S.

worked in early days in the Copper Queen mine, and is still encountered to some extent within the oxidized zones. It is rarely, however, a conspicuous gangue mineral in the ores now exploited.

The unoxidized pyritic ores, particularly those too poor for working, are intimately associated with several minerals, chiefly silicates of calcium, magnesium, and aluminum in varying proportions, which so far as observed occur only in crystals of microscopic size. Their identification accordingly depends upon the microscopical investigation of thin sections. Of these minerals probably the most common is the calcium-magnesium amphibole, tremolite, usually occurring in aggregates of minute radiating prisms, which under the microscope show the characteristic cross sections, cleavage and optical properties of this mineral. Nearly or quite as abundant, and usually accompanying the tremolite, is a colorless pyroxene in microscopic grains, usually less than  $\frac{1}{10}$  millimeter in diameter, rarely showing sharp crystal outlines, but exhibiting a distinct tendency to the development of stout prismatic form. This mineral has the optical properties of diopside. Although neither tremolite nor diopside, so far as observed, occurs in the Bisbee quadrangle in crystals large enough to be seen with the naked eye, their presence in the altered mineralized limestone can generally be recognized by a faint greenish tint in the rock, joined with a certain compactness of texture that is unlike that found in any of the unaltered limestones. Most of the limestone encountered in the Spray workings from the fourth level down, and in the Calumet & Arizona mine from the 850-foot level down, exhibits this development of tremolite and diopside, and all gradations may be studied, from limestones consisting almost exclusively of calcium carbonate to those in which all of the carbonic anhydride has been replaced by silica.

A colorless garnet, probably the calcium-aluminum garnet, grossularite, occurs in some of the altered limestone, associated with tremolite and diopside. This mineral, associated with tremolite, diopside and calcite, was particularly noted in the altered limestone from the new station on the 1150-foot level of the Calumet & Arizona mine (the deepest point reached in the underground exploration of the district) and on the fifth level of the Holbrook, northeast of the shaft.

Quartz varies greatly in abundance in different portions of the ore-bearing ground. A few small veinlets of quartz, carrying pyrite, were observed in the altered limestone on the 950-foot level of the Calumet & Arizona mine, but vein quartz is exceptional in connection with the cupriferous ore bodies. The mineral, where it occurs at all, usually has the form of fine-grained aggregates that have replaced the calcium carbonate of the limestone or the feldspars of the granite-porphry. Small amounts of quartz may usually be found as a microscopic constituent associated with tremolite, diopside, garnet and pyrite in the altered limestones of the locally prevalent type. Near the porphyry mass of Sacramento hill quartz is more abundant than elsewhere. Much of the rock in the vicinity of the Gardner shaft, for example, originally limestone, now consists essentially of a finely crystalline granular aggregate of quartz with varying amounts of pyrite and chlorite. The bottom of the shaft, at the time of visit, was in such material. Quartz of the same fine-grained granular character associated with pyrite, sericite and kaolin also makes up much of the altered and mineralized granite-porphry of Sacramento hill.

On the 800-foot level of the Lowell mine the greater part of the west drift is in a mass of loosely coherent pulverulent silica, much of which, when dry, runs like sand. This material is associated with some yellow clay, a little decomposed porphyry and occasional bunches of oxidized ore. Embedded in the sandy material are occasional very irregular harder masses composed of finely granular quartz. These are cavernous and drusy on their peripheries and lie in the loose siliceous powder much like flints in chalk. The microscope shows that the pulverulent silica is composed of grains which are neither rounded by attrition nor yet bounded by crystal planes. They are rough in outline, showing either that they have undergone corrosion or formed part of a fine-grained aggregate from which some more soluble constituent has been removed. It is probable that this saccharoidal quartz represents a zone of fissuring and brecciation in the limestone, along which some silicification took place. The calcium carbonate of the shattered, partly silicified limestone was then dissolved away, leaving the quartz in its incoherent condition.

Most of the soft, earthy oxidized ores mined in the Copper Queen and Calumet & Arizona mines are accompanied by, and more or less intimately mingled with, limonite and clays of various colors. The limonite sometimes occurs in stalactitic or botryoidal form, but in the present workings is more often earthy and mixed with ore or clay.

The clay is sometimes white, sometimes pink or greenish-gray, but more often it is yellow or reddish from the presence of limonite. A snow-white waxy variety, beautifully diversified by little veinlets of light-green malachite, was collected on the second level of the Copper Queen mine, about 250 feet south of the Holbrook shaft, and subjected to chemical examination as representative of the purest form in which these clay-like secondary products occur.

(TO BE CONTINUED.)

## Emergency Treatment for Cyanide Poisoning.

H. C. Jenkins of the Institution of Mining and Metallurgy, in his paper on this subject, dealt mainly with the preparation of the antidotes which are recommended by the State of Victoria. The chief points are first to have the solutions always ready for use and to keep them unchanged perhaps for years—conditions that plainly indicated that they should be sealed hermetically in glass—and then to provide for their being mixed together and administered without loss of time, or the risk of administration of broken glass in a mixture full of precipitate. The gram and a half of caustic soda was made into a solution with 300 c.c. of water; this was a solution that would keep for a great length of time in a sealed flask of suitable glass. The two grams of magnesia would be perfectly safe in a sealed tube, but the seven and a half grams of ferrous sulphate that had to be in solution in order to prevent waste of valuable time when wanted most, presented difficulty, and even when made distinctly acid with sulphuric acid in 30 c.c. of water and sealed up in glass it deposited in a few weeks or months the usual precipitate of basic ferric sulphates.

The author found, however, that by using freshly well-boiled distilled water for the solution, boiling it in the tube and then sealing it before aeration of the solution could occur, that the action was stopped; its commencement appears to be dependent upon the oxygen dissolved in the water.

The exterior containing case is made of tin, 5 inches diameter and 7 inches high, painted red on the exterior to attract attention, and fitted with simple compartments arranged to keep each tube and the flask in place. There is also a filtering shelf of finely perforated sheet metal made strong enough to be used in the fracturing of the glass vessels when the antidote is required, and serving to keep back any tiny fragments of glass that might be so produced, there being no time for any more elaborate manipulation for this purpose. The case serves as a containing vessel of the mixture for administration. It is intended that this case be kept on a special shelf or hook in a prominent position, with the sheet of instructions permanently displayed near to it in full sight of the workmen.

The author cites the case of a Kaffir poisoned by cyanide who was successfully treated by means of ferrous sulphate and sodium carbonate administered off the laboratory bench in somewhat indefinite quantity. Cases such as this would alone justify some dependence on this antidote.

Below is given instructions how to treat a case of cyanide poisoning in the absence of medical assistance. Everything depends on prompt action, for the chance of recovery is extremely small after the lapse of a very few minutes if a fatal dose has been taken. One person should be dispatched for the nearest medical assistance that is available, but no delay in treatment should be permitted to occur on this account. The first care must be to neutralize the rapid poison by the antidote, and then to empty and wash out the stomach as soon as is possible.

The antidote consists of two solutions sealed up in bottles, and a sealed powder. The two solutions are to be first mixed together in the tin vessel in which they are packed by breaking off the sealed ends of the bottles. The tube containing the powder is also to be broken, and the whole of the powder added to the mixture, and the dose is to be administered as soon as possible. If the patient is still conscious he must drink the antidote at once without waiting for the insertion of the stomach tube; but if not conscious or not responsible then a small gag must be firmly inserted between his teeth, so as to prevent the stomach tube from being bitten off, and the tube is then to be passed down his throat and into his stomach. The antidote is to be poured down the tube, and is then to be followed by some water.

In any case, either before or after the antidote has been taken, the stomach tube (found in the set), is to be inserted, and about half a pint of water is to be poured down it, the patient being placed in a reclining position, a little raised from the ground. The insertion of the tube may produce vomiting; this, however, is entirely favorable to the course of the treatment. When the last of the water is placed in the funnel, and before it has all descended into the tube, the funnel end of the latter is to be lowered so as to cause the tube to act as a syphon, and the stomach emptied as much as possible of its contents. Fresh water is to be poured down the tube, and the stomach again emptied, and this is to be repeated several times so as to thoroughly wash out the stomach. When this has been done the tube can be withdrawn.

If the tube be not at hand every endeavor must be made to induce vomiting after the administration of the antidote, while an equal endeavor must be made to cause the patient to swallow more of the antidote between the intervals of vomiting, if the administration be not already and completely made.

Vomiting may be induced by an emetic, like mustard, or by tickling the back of the throat with a clean feather, or a piece of clean india rubber tube, or the finger. An ample quantity of warm water should be swallowed and vomited, so as to wash out the stomach as in the previous case. Should warm water be not at hand cold water may be employed in its place.

As soon as the stomach has been satisfactorily emptied and washed and the stomach tube withdrawn, steps should be taken to bring about artificial respiration should the patient appear to be in a state of collapse and should his breathing cease to be noticeable. The application of smelling salts or of ammonia to his nostrils may itself induce breathing again; but if this be not immediately successful, the patient should be treated as is done in cases of partial drowning or suffocation.

The package for treatment should consist of a tin vessel with lid, in which are packed:

(a) A hermetically sealed bottle, containing  $7\frac{1}{2}$  grams of ferrous sulphate dissolved in 30 c.c. water; and

(b) A hermetically sealed bottle, containing  $1\frac{1}{2}$  gram of caustic soda dissolved in 300 c.c. water; and

(c) A tube containing 2 grams of magnesia.

There should also be a gag for the purpose of opening the clenched mouth of an unconscious person, and a stomach tube, that can be passed through the gag and down into the oesophagus into the patient's stomach. This is very easy to effect, but several persons in charge of the plant should receive instructions from the nearest medical man as to how to insert a stomach tube, so that they know how to use it should occasion at any time arise.

The apparatus should never be allowed to be removed from its place, but always kept complete and ready for emergency. It is advisable to keep it in duplicate, in plainly marked positions in the works.

## Natural Bridges in Utah.

There exist to-day in San Juan county, Utah, three notable natural bridges. The largest of these bridges spans a canyon 335 feet 7 inches from wall to wall, and is a splendid arch of solid sandstone, 60 feet thick in the central part and 40 feet wide. Underneath it there is a clear opening 357 feet in perpendicular height. The accompanying cut shows the dimensions of this bridge as compared with the Capitol at Washington and the Great Pyramid. The other two bridges, while of proportions somewhat less massive, are worthy of note. They have been seen by few white men. The August Century contains an account of a visit made to these natural bridges in 1903 by H. J. Long and a cattleman named Scorp, with pictures of the colossal bridges, one in color, from drawings by H. Fenn from photos by Mr. Long.

## Mining and Ore Treatment in Western Australia.\*

NUMBER IV.

Written by DONALD CLARK.

In the chloridizing furnace the fire-box of the ordinary furnace is used as an auxiliary source of heat. The ore, after leaving the fourth hearth, slides into the cylinder, where salt is added, and the gases from the movable fire-box pass through and over it. Air is admitted also at the end of the cylinder.

An ore like that from the Boulder does not roast in the same way as the ordinary pyritic one. The finely powdered ore clings in dusty clots; it is light and fluffy, and like flour will not flow freely. Its penetration by air is slow, while any attempt to stir it vigorously or to cause it to flow in heated air leads to an inordinate amount of dusting. From a few experiments made with similar material, it was found that as soon as the calcium carbonate was decomposed the resulting oxide was acted upon by sulphur dioxide, giving calcium sulphite. Calcium sulphide also formed from the inter-reaction of pyrites or ferrous sulphide and calcium oxide. These in their turn slowly oxidized to calcium sulphate. Certain it is that the Boulder ores give on a bad roast a considerable quantity of alkaline sulphides. This may be due to the reactions given above, or more probably to the alkalies and alkaline earths in the ore reacting with ferrous sulphide direct. The product from all the furnaces on the field has a slight alkaline reaction.

The method of testing the roasted product is done, I was informed, by adding lead carbonate to the aqueous extract from the ore; this shows soluble sulphides if the black or brown lead sulphide is produced. A further extension of this is to boil the ore with caustic potash and then filtering; lead carbonate added to this solution will show the presence of sulphides, which may not be soluble in water. I have confirmed this test, which is a very useful one, so far as ferrous sulphide is concerned, although finely ground disulphide or pyrites only gave a faint sulphide reaction.

The quantitative method of ascertaining the state of the roast depends upon the termination of sulphur present as sulphide. This is done by determining the total amount of sulphur present by fusing the material with sodium carbonate and some oxidizing agent, thereby transforming the whole of the sulphur to the form of sulphate of sodium. The fused mass is disintegrated and filtered; the filtrate evaporated to dryness with HCl to render silica insoluble. The solution is taken, treated with barium chloride, and the sulphur determined from the weight of the barium sulphate produced. The sulphates are determined by boiling some of the ore with sodium carbonate; this serves to transform the sulphates into sulphate of sodium. The ore is filtered, the filtrate acidified, evaporated to dryness, and the solution treated as before, and the sulphur present as sulphate determined. The difference between the two amounts of sulphur is attributed to sulphides. The process can be shortened materially from that given in this description, but it cannot be said that such a mode of determination is altogether satisfactory. The difference in the two amounts is but small, and this small amount has to carry all the errors of both determinations. Further, the presence of a small quantity of barium sulphate in the ore would not be decomposed by boiling with sodium carbonate, and the sulphur in it would consequently be counted as sulphide.

The estimation of the sulphur as insoluble sulphide is not an easy matter on such an ore as this. The method of fusing with a known weight alkaline carbonate and some oxygen-supplying compound, and estimating the alkalinity afterwards, fails in the presence of easily decomposable sulphates, e. g.,  $\text{CaSO}_4 + \text{Na}_2\text{CO}_3 = \text{CaCO}_3 + \text{Na}_2\text{SO}_4$ ; each molecule of calcium sulphate neutralizing one of carbonate of sodium.

As the sulphur as sulphide has not only all the errors of determination, but also all of a bad extraction laid on its shoulders, it is necessary to state that this is not the case, but that all other reducing agents must be looked upon as equally bad; and even the oxidation of such agents may not suffice to correct the evil. The sulphur as sulphide, then, can only be looked upon as an accompanying evil, and a simpler test might be devised to show the state of the roast relative to the consumption of cyanide. For example, the KOH extract might be acidified when diluted, and its reducing power estimated with a standard solution of  $\text{KMnO}_4$ .

The same samples might be tested with KCy shaking test to determine the consumption of cyanide. From the two on ores of a similar nature a table could be readily constructed showing the relationship between the reducing power of the ore and the consumption of cyanide. The most direct test as to the state of the roast is tried now at test mines, and also at the Great Boulder. This is the shaking test with cyanide on a sample of the ore.

Although such tests are useful for the same class of ore, and while they may give good results so far as showing the state of the roast is concerned, they

may be of little or no use in guiding the metallurgist as to his probable extraction. Very often a roast that will respond to all tabulated tests will fail to give a good extraction, and one reeking with basic and other sulphates, which the text-book authorities are so strong on, may be made to give a first-rate extraction. The cause of the non-extraction of fine gold by solution is either due to the destruction of the solvent by some other agent in contact with the gold or by want of contact of the solvent with the gold. The latter includes cases of bad percolation where certain patches of ore are not acted on at all, and the more common cases of the gold being locked up in some other material, either physically or chemically. It may exist in fused oxide of iron, or in some easily fusible silicates; it may exist in a telluride naturally, or may be locked up in some metal or metallic sulphide formed in a roasting furnace. In the case of some solvents, such as chlorine, the outer coating of many of the reducing agents will be destroyed, and the gold, whether locked up physically or chemically, will be dissolved, the exceptions to this being the case of an insoluble compound forming and enveloping the gold, such as chloride of silver. Even this material does not prevent the entire solution of the gold, provided the latter is present in the alloy to the extent of 60%. Should the particles enclosing the gold be too coarse, then the solvent action may be too slow, even if in course of time a perfect extraction might be obtained. While the solvent is dissolving the particle it is being destroyed as such, and consequently can not attack the gold, so that there must be an ever replenishing supply to all such particles. It is very often forgotten by the metallurgical engineer that he is dealing with masses which may only be very imperfectly represented by molecular formulae. He forgets that every change that takes place is between molecule and molecule, and that in the smallest particle visible there are some myriads of molecules, and in the time given for action a comparatively small number may be acted upon. Chlorine is able to penetrate and dissolve gold out of material impervious to cyanide; so that when the latter solvent is used on rich ore which is likely to frit in any way, it is necessary to grind the product very finely, and thereby expose as much of the metal as possible. This is an accepted axiom on the Kalgoorlie field.

After leaving this furnace the roasted material is sent along by means of push conveyors, two for every six furnaces, to a bucket elevator. There are two of these elevators, each delivering ore continuously into a mixer. Each mixer is a small steel vat, 4 feet in diameter and 2 feet deep, fitted with a movable cover, through which a shaft fitted with paddles works. There are six discharge outlets near the top of the mixer, through which the pulp flows into the amalgamating pans. The hot sand is churned up with the stream of solution supplied from the wash water and excess cyanide solution from the filter presses. The object of the mixers is to damp the ore without creating much dust; in this they are partly successful. The pulp flows from the mixers into twelve grinding and amalgamating pans. These are of the usual Wheeler type, and are arranged to have a continuous overflow from sets of three into a large settling pan. The contact of the dry, hot sand with water causes a solution of many soluble materials present in the roasted ore. The two which have the most influence on subsequent operations are calcium and magnesium sulphates. The former exists in the mine even at low levels, in the form of gypsum ( $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ ), while it is also produced from the interaction of calcium carbonate, sulphur dioxide and oxygen of the roasting furnace. The magnesium sulphate is produced in a similar manner.

The anhydrous calcium sulphate is very slowly acted upon by water. It is practically dead, burnt plaster of paris, but in course of time it becomes  $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$ , or the ordinary plaster of paris, which, under ordinary circumstances, sets very rapidly, becoming  $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ , or it goes back to gypsum again. This action is more or less retarded by the presence of other salts, but appears to be going on at almost all stages of operations at the Boulder. The settling takes place to such an extent in the pans that all parts become coated with a crust of material which has to be chipped off from time to time. For the same reason, it is useless hanging amalgamated copper plates in the pans, the amalgamation being done by adding large quantities of mercury, somewhat after the fashion of silver amalgamation, and periodically replacing that amalgamated. Whether the crystals of gypsum, as they form, are able to lock up gold and prevent it from further attack I was not able to discover, but should this be the case it would be preferable to allow sufficient time for the crystals to form and then grind them, it being obvious that when once the compound formed regrinding would reduce it to a slime, which would not reset. The chipmings from the pan bottoms have a high value, but this is due to the amalgam entangled. The pans are cleaned up twice per month. By starting at one end of the series and doing one pan per day, then on the thirteenth day the first pan would be again cleaned up, and so on.

The amalgamation which takes place is very good, while the loss of mercury is small. This is no doubt due in a great measure to the fact that hot alkaline

cyanide solutions are used in place of water in the pans, thereby keeping the mercury and gold bright, and also to the fineness of the product fed into the pans. A pulp which contains from two and one-half to three parts by weight of water to one of dried slime has been found to be fluid enough for the operation. Under ordinary conditions a pan is not a suitable amalgamating contrivance if worked with a continuous supply and discharge. In the first place the finer particles, including the fine gold, are washed out without ever getting to the bottom or coming in contact with the mercury. Secondly, the fine gold present only amalgamates with great difficulty, and even if amalgamated plates are hung on the baffles or sides of the pan the bulk of the fine gold will pass out. Thirdly, a reducing action appears to be always going on, and hydrogen is always evolved in appreciable amount, while with arsenical ores arseniuretted hydrogen is given off freely. Fourthly, the pulp has to be so diluted that practically all the mercury fed in periodically immediately falls to the bottom, where it becomes covered with all the heavy metallic minerals present. It should not be necessary to point out these simple facts, but in parts of Australia the system of pan amalgamation is still believed in as the most perfect of all methods. It is a different proposition altogether to take a thickened pulp and have globules of mercury disseminated evenly through it, to add chemicals to assist amalgamation, and then to thin down so that mercury and amalgam sink to the bottom and the thin fluid pulp overflows. The pan amalgamation process at the Boulder serves to eliminate the coarse specks of gold from the pulp, while only the finest or that capable of being dissolved by cyanide solutions in a limited time is carried over into the settlers. Solution of gold is, in fact, going on all the time. The amount of gold recovered as amalgam varies from 30% to 60%. The amalgam caught by the pan is treated in an amalgamating barrel and thereby cleaned. The cleaned, well-squeezed amalgam contains from 25% to 33% of gold. The pulp overflows from three pans into a settler. This is of the usual type, having suspended paddles working from a vertical shaft. The duty of the settler is to allow the fine globules of mercury carried over to subside. The pulp is so fine when it leaves the pan that 98% of it will pass through a 120-mesh screen, the balance through a 100 mesh. From the settlers the pulp passes into a sump, from which it is pumped up 48 feet to two distributing tanks, each having four discharge holes leading to four small conical spitzkaste, from which it overflows into a series of spitzkasten. The former serves to eliminate any coarse or heavy particles which may have come over with the slime. These are led back again into the pans; the latter are for the purpose of thickening the pulp and clarifying the solution. So effectively do the spitzkasten do their work that clear water is drawn away from the top of the final one, while a pulp having a consistency of one of water to one of slime by weight is drawn off below. The clear water from the spitzkasten is led back to the mixers, while the thickened pulp is led into the agitation vats. The strength of the solution is now made up to from .01% to .08% KCy, and the paddles are started and as a rule kept going from sixteen to seventeen hours.

Tests are frequently made to see if the gold is passing into solution. Since the weight of pulp and solution is nearly equal, by taking samples and filtering and determining the amount of gold in the solution, the decrease in the slimes may be readily inferred. This result is checked from time to time by assaying the slimes themselves. The ordinary method of determining gold in cyanide solutions by evaporating to dryness with litharge, and then running down the lead button and cupelling, is not looked upon with favor by some of the metallurgists on the field. It is held that large losses take place on account of the solutions being saturated with chlorides and other salts. Mr. Goldstein of the Great Boulder No. 1 is positive that this method of assay is misleading, and seeks to lessen the error by adding charcoal as well as litharge to the solution to be evaporated. He also fuses at a low temperature.

(TO BE CONTINUED.)

### Unscientific Gold Milling.

TO THE EDITOR:—I recently returned to the city from a few months in the mountains where I was employed as an assistant to the millman. After being there a week or two I found it necessary to remove the cam shaft in order to replace a broken cam. To do this it was necessary to remove the stamps, and this, owing to the peculiar construction of the mill, could not be accomplished without first removing all the stamps of the battery. To make matters worse I had to knock off the boss heads. I had taken one off after much difficulty, and was engaged on a second one when the boss millman came in. He looked surprised and asked, "What are you trying to do? Don't you know those things are put on to stay—they are not intended to be taken off." On explanation he agreed that it seemed the only course, but he could not see how we were to put them back again so they would stay. On cleanup day the coarse sands were taken from the battery and put in the cleanup barrel, which the boss ran steadily for over thirty-six

\*Abstract Australian Mining Standard.

consecutive hours, at the end of which time he had as "fine" a lot of quicksilver as one would wish to see. "Somehow," he said, "it don't seem to get together." Finally he turned the barrel with the man-hole uppermost, and then called in the stable man to help, and the two "agitated" the mass, each armed with a 4-foot piece of 2x4 scantling, for three solid hours. Then being satisfied that the "quick" was all right, or too tired to "keep up his lick," I don't know which, he turned the barrel over, and with a small stream of water and scraping with his hands, he finally got the stuff out of the barrel. He panned the grit then to recover. It took him the best part of three days and he felt proud of the result. He probably got about 50% of the "quick" and amalgam. The tailings, together with sweepings, "concentrates" from cleaning plate, amalgam, etc., he sent to the smelter, instead of treating the material as he should have done at the mine. It was a daily thing to clean up several ounces of "quick" and amalgam from the concentrators. I saw things done at that mill unlike I ever saw before elsewhere, or ever heard of, and when the "boss" ordered me to feed the rock breaker, and at the same time keep my eye on the feeders and the machines, I found I was unequal to the requirements of the place, and that is why I am in the city—looking for a new job.

MILLMAN.

### Underground Electric Haulage.

In extensive mining operations the transportation problem is always one of importance and of economic

the following portions of the system to be in operation:

	Feet.
The main tunnel from its entrance at the Economic mill to the Gold Coin shaft over 1000 feet of which tunnel is 8x14 feet with double tracks, the remainder single track	3,808
Bull Hill lateral	2,000
May B lateral	223
Gold Coin laterals	370
Sidings	991
Economic mill tracks	405
Dump tracks	1,395
Total tracks	9,402

It is proposed to extend the main tunnel and its branches several thousand additional feet, the total system to be about 20,000 feet when completed. The tunnels are electrically lighted, as well as the buildings. The power is supplied by the Pike's Peak power plant of the Pueblo & Suburban Traction & Lighting Co.

### Sampling Ore Shipments.

Written for the MINING AND SCIENTIFIC PRESS by  
W. J. ADAMS, E. M.

It is a frequent belief among mine owners and leasers, and almost accepted as axiomatic by some, that custom works, whether smelter, chlorination or amalgamating, are often unfair, even though owned and managed by men of the highest integrity and technical skill. This slur is constantly thrown at them, because, forsooth, the ore shippers do not get the returns expected according to their own sampling and assaying.

Why these discrepancies occur, is the object of this

or even more frequently, the errors of values would balance themselves in the course of time—perhaps in six months, perhaps in a year—but if the market price of the metal was fluctuating, each individual lot must stand on its own valuation.

It is not a good thing to cheat oneself, and yet this is what many miners do, partly due to human nature, but mainly to negligence. Important shipments are made and the values determined by the assays of grab samples, and it is human nature to pick out, perhaps unconsciously, the better class of rock and certainly clean ore, and not the fines which probably are much poorer or much richer, from the waste which must get into the bulk if worked on a commercial scale. Or a grab sample is taken from the top of each sack of concentrates, which are usually damp when put into canvas bags, and always unequally mixed, the finer and generally richer sulphurets collecting on the top in settling the mineral by jumping the sack. Perhaps a little more physical exertion and supposed carefulness is employed. The ore is of all sizes from ten pounds weight to dust, and each day's product is dumped together, from which an occasional shovelful is thrown on the sample pile while filling the sacks. At the end of the day this is taken to the assay office and found of sufficient value to ship. The same operation is repeated each day, and at the end of a week sufficient has accumulated for a carload and is sent away; but a different weight has been sacked each day, and there have been appreciable differences in the daily assays. Yet the shipment is valued on the average of the assays and perhaps also checked (?) by the assay of all these samples mixed together. With such absurdity, can

Office and Tunnel House of the United Mines Transportation Co., Victor, Colo.

interest. Large operations require for the purposes of economy that mechanical haulage of some sort be employed. At Cripple Creek, Colo., this problem has received much attention, and one of the most complete installations is that of the United Mines Transportation Company. This is a common carrier, the electric system being employed. The company has extended its system on both the surface and underground, hauling the ores of its own mines as well as those of other companies whose properties are situated along the line of transportation. The underground features of this scheme are of importance, as the extension of the tunnels not only makes accessible the resources of the mines, but affords an outlet for water and improves ventilation. The accompanying illustration shows the buildings of the United Mines Transportation Company at the mouth of the main tunnel. The last official report of the company shows

article, being brought home to the writer very lately when a dispute came to his knowledge, due, as far as can be learned by correspondence, to errors in sampling on both sides, but mainly to the faulty method pursued at the mine.

After years of experimenting by competent metallurgists, in all parts of the world and on all classes of ore, one method was devised which gave as nearly accurate a sample of the ore tested as it was commercially possible to obtain, and this has been now universally adopted by all sampling works, even those under the ownership and control of the mine owners themselves. Unless a similar procedure is carried out at the mine, the resultant values will not tally, except by accident or when the shipment is absolutely uniform in size of rock as well as in the distribution of its valuable contents. However, it is very probable that with regular shipments, weekly,

there be expected any agreement between mine and reduction works? Perhaps only concentrates are shipped, but the ore has come from all parts of the mine, and there is a daily difference in the values of the sulphurets, depending on whether the bulk of that day's output came from the oxidized ore of the upper levels or the sulphides of the lower levels, whether, also, taken from the pay shoot or outside of it. Then occasionally the settling boxes are cleaned out and mixed with the concentrates of that day's run of the mill. These concentrates are dried and sacked each day and graded according to the assays into different lots; but even in each lot there is often a variation of values between the contents of the sacks of ounces of silver and dollars of gold. Can a true estimate be made by averaging these different assays, or assaying the mixture of all the samples, with the variations of weights of each day's run, as

well as the difference in value? It is an absurdity, and yet all of these methods are employed, and by men known to the writer as intelligent, good practical miners and superintendents, with other methods just as ridiculous.

Twelve years ago the writer was employed as metallurgist by two companies in Placer county, California. One of the mines produced high-grade shipping ore in addition to that worked in the mill, the grades typically distinguished by the eye. Within a half mile of this was another mine, the ores of which when compared side by side to ocular demonstration looked identical, and on this appearance the second mine was taken under bond by outside parties, and the writer was requested to oversee a test on 100 tons of milling ore in the company mill. About twenty tons were hauled to the mill to start on; but an examination of this caused the writer (owing to the waste and "bull quartz" mixed with it) to call the bonder to one side and tell him that before the test was started he must remember that a "custom mill sometimes cheats." No further explanation would be given, but as a result three "samples" were brought for assay to serve as a guide to the large values in the ore. One piece, four ounces in weight, represented an average sample of the ore sorted out for shipping, and supposed to be worth \$1500 or more; the second was one piece of the milling ore, clean quartz and one pound in weight; while the third consisted of three pieces of clean quartz, each the size of a walnut, which constituted the "average sample" of the twenty tons sent to the mill. The shipping ore assayed \$10 per ton instead of \$1500 as in the ore of the company's mine identical in looks; No. 2 gave \$8 and No. 3 \$6. The test was made, amalgam saved, retorted and assayed, concentrates dried, weighed and assayed, and the tailings during all the run systematically sampled and assayed, and the total value of the original ore, combined from these several items, gave only \$3.50 per ton. Then the bonder wanted to know what became of the values, as the average of the three samples was \$8 per ton, and if the writer had not shown him while on the ground the true facts of the case—a minute quantity of clean quartz assayed and a working test of a large quantity taken out of the mine just as blasted and carrying waste and barren quartz—he would never have been persuaded but that the mill owners had absorbed for their own benefit the difference of \$4.50 per ton. This is by no means an extreme case, and though this gentleman was a shrewd and successful business man, he knew nothing about sampling, and all rocks looked alike to him.

In general a mine has not the proper facilities in regard to floor room, crushing devices, storage bins and the other adjuncts to allow the operations of systematic sampling such as is employed by a smelter or a custom sampling works; but even with limited ground, a really accurate sample can be procured by exercising care and judgment.

Before entering into the various ways this can be done, it will be well, even though accused of explaining something every mining man knows, to describe briefly the regular custom sampling.

The ore is emptied from the sacks on the pinnacle of a cone, or, if of several tons, on the edge of an extended wedge, and the large pieces are broken with a hammer to a nearly equal size, not to exceed 2 inches in diameter. When all the ore of this shipment is emptied, and the sides dressed to a uniform slope, the sampling is begun. Depending on the intrinsic value of the lot, from nine to two shovels of the material are thrown on the shipping pile and one shovelful on a cone, so that, with the samplers starting from each end, there remains after all the ore is shoveled, two cones, which contain from one-tenth to one-third of the original bulk. This is then put through a rock crusher and reduced to a size not to exceed that of cherry stones. If no crusher is available, it must be broken to at least one-half its original size by hand. An iron cross is now laid on the sampling floor and all the material again shoveled alternately from each cone, one-half to the shipping pile and the other half on the cross. When this is completed, the men with square-pointed shovels walk around and around the cone, gradually flattening it and drawing the ore uniformly to the outer circumference till the top of the iron cross appears. Then opposite quarters are shoveled to the shipping pile, and the remaining quarters reconed in the same way till the bulk is reduced to about fifty pounds. This is then put through a fine grinder, screened through a sieve of 50 or 100 meshes, and further reduced by quartering to the assay sample. The final work must be done in a room free from draughts and separated from the main sampling room.

In the case of concentrates or precipitates no crushing of course is needed; but the operation otherwise is the same. Should the material be of very high grade it is advisable, after the first coning, to separate the two quarterings and make a duplicate sample which should check in value on assaying.

At the mine, where this complete method is not available, either take every tenth bucket or car, or every tenth shovel, according to bulk of the shipment, and put into a coning pile, breaking up the large pieces. When the shipment is complete, crack the rock into halves, and take every other shovel, break again and reduce one-half till the sample is small

enough to be manipulated in the assay office; but never reduce for assay sample till the shipment is complete. Only in this way can the proportional weight of each day's production be included in the sample.

In regard to concentrates, when filling the sacks take every fifth or third shovel and proceed as above; but, as they are ground uniformly fine, a very accurate sample can be conveniently taken after sacking.

Fill the sacks and sew them ready for shipment. Then, after laying them horizontally, open the two corners very slightly, till a "trier" can be introduced. Shove this diagonally through the sack from each corner till the bottom is reached, and quarter down the sulphurets withdrawn. Given a piece of gas pipe  $\frac{1}{2}$  to  $\frac{3}{4}$  inch diameter, any blacksmith can make a "trier." Split off one-half the pipe for 6 inches to 1 foot, then round and sharpen the lower end, and bend over the upper end for a handle.

As the trier is inserted it is twisted around like an auger; and, in fact, if no trier can be procured, a small ship's auger will answer the purpose, but it is harder to clean off the sample after each boring.

So far everything written above has been to the benefit of the reduction works as against the shipper, but it can be stated that some reduction works also are faulty in their work, where they follow out the nearly obsolete custom of taking every fifth or tenth sack from a shipment, sampling them only and basing the values of the entire lot on these returns. That style of sampling is only guess-work, no more, no less, and should under no circumstances be countenanced.

There are some points hardly in the province of sampling, but they should be included in this article, where the reduction works cling to some old customs by which the shippers are unjustly treated and do not get the full value that is due them, considering the small losses incurred in modern metallurgical works.

Granted that the sampling is fair to both sides and the actual value of the metallic contents determined, the smelters ask a stated sum for working charges, which is also fair to both sides.

Now, in addition to this, on copper ores there is arbitrarily subtracted 1.3% of the copper, because in years gone by there was that difference between the assay and smelter returns, owing to loss in slag, etc. At the present time there is never a loss greater than .3% or the furnace manager is discharged, but the shipper is still taxed with a loss of 1%, or twenty pounds of copper to the ton, without any recompense. To still further discourage him, he is also given a price per pound for the remaining copper contents which is 5 cents less than the current market quotations, and with copper at 10 cents per pound only gets 50% of its value. Yet he pays a working charge that alone gives a profit, and would not grumble at an increase if he received the full value which the ore calls for. This 5 cents is supposed to be for refining charges, and is also based on the cost of expensive methods now obsolete.

Suppose it is a lead ore. The smelters pay on the returns from a fire assay, which has been proven time and again to be lower than the actual output of the ore, so that the returns should be made on the wet assay.

Suppose it is gold and silver. Such assays are made which give an excessive loss. Nitre is used in the crucibles, and gold with silver volatilized. Cupellations are carried out in muffles at such high heat that the cupels absorb an excess of the silver; in addition to this, whether the ore carries twenty ounces or 10,000 ounces of silver, an arbitrary reduction of 4% is taken off the number of ounces for refining charges. These refining charges are certainly a legitimate and necessary expense, but should be given at the proper cost per ounce and the full value of the silver stated. The difference in returns would be considerable under the fluctuations of the silver market.

Years ago the writer was connected with a small smelting and refining works in San Francisco, Cal., where very high-grade concentrates, 2000 ounces to 10,000 ounces silver, were reduced.

These concentrates were assayed by crucible and cupel, and the returns based on the direct assay. As a matter of curiosity, the cupel was ground up and re-assayed, when there was found to be a loss, or rather gain, over the returns, absorbed by the cupel, of forty ounces to the ton, and, as the owner of the works remarked, "that constituted the smelter's profit."

Times and methods have improved since then and no such losses are now allowed, but still, as shown by this extreme case, there is danger of unaccountable losses, even under most honest management.

As shown above, custom works are not swindling concerns, but in these progressive times, should change some of the arbitrary rulings founded on obsolete methods. Even if increased working charges are necessary to carry on the business at a profit, the smelters should keep from antagonizing their customers by billing these excesses.

The United States laws provide for adverting the claim of any person who attempts to appropriate mineral lands under agricultural filings.

## THE PROSPECTOR.

The statement made last week in the "Prospector" to the effect that the Laramie epoch was at the base of the Cretaceous was an oversight. The Laramie is at the top of the Cretaceous and extends upward into the Eocene—the lowest Tertiary.

There are dry washing machines which work as perfectly as a device of this construction can be expected to work. They are all constructed and operated on the action of an intermittent current or blast of air. This may be of varied volume and intensity and is usually supplied by a bellows. In conjunction with this a shaking screen is actuated by a cam or eccentric device. The result is the blowing away of the lighter particles of earth and dust and the screening out of the larger pieces of rock. Should gold be present in pieces so large as to remain on the screen, it is presumed the operator will see them, while the smaller nuggets and flakes will pass through and be concentrated with a comparatively small amount of material of high specific gravity, such as "iron rock," garnets, etc. The field for the dry washer is in dry desert regions where the "wash" contains the minimum of moisture. It is not the best device for a wet country like Alaska. In such regions water is usually available, and a rocker, sluice box or some similar "wet process" is productive of better results than those obtainable with a dry washer.

The mineral specimens from Baker City, Or., are determined as follows: No. 1 is a quartz rock, seemingly quartzite—a sandstone silicified by the infiltration of silica. No. 2 is a dense flint-like quartz rock and possibly is a portion of the same reef as No. 1, though the latter is somewhat decayed, and contains a few small grains of magnetite. No. 3 is also quartz stained with iron oxide and contains veinlets of quartz. The red portion is porous, and has been subjected to some agency which has leached out some former constituent, possibly pyrite. This rock may contain precious metals and should be assayed for them. No. 4 is flint and may come from a limestone formation somewhere in the neighborhood. A prospector would be justified in having each of these rocks tested for gold, though No. 3 is the most promising in appearance.

The rocks from Holmes, Wyo., are: No. 1 basic gneiss, largely composed of hornblende and its alteration products, with feldspar and quartz; mica is also present. No. 2 is similar, though more massive than gneissoid. Both of these rocks have resulted from the alteration of some basic rock, possibly like No. 3, which is gabbro, and No. 4 is diorite-aphanite. Although No. 4 contains visible iron sulphide, it can in no sense be considered an ore. However, this and similar rocks, under the influence of hot mineral solutions, may be so completely changed as to become unrecognizable, and may also become a carrier of valuable minerals to a sufficient extent to entitle it to be classed as an ore.

## Capilar Oil Filter.

An old and simple principle, that of capillary attraction, is utilized by the Capilar Co., 138 South Fourth street, Philadelphia, Pa., in the filter here-with illustrated. The company claims that the

CAPILAR OIL FILTER

Capilar will maintain an even flow of filtered oil under all conditions of service. They say that a filter having a capacity of one gallon an hour at a temperature of 100° F. gives a continuous flow of oil irrespective of the ratio of clean or dirty oil in its tanks. The oil passes upward through a series of wicks, as shown in the illustration, leaving the dirt behind. The heating coil of the tank is so arranged as to prevent overheating of the oil. Neither water nor impurities of even microscopic fineness can be carried over into clean oil storage, according to the manufacturer's claim, and that the oil, after passing this filter, is as efficient as it was originally.

So confident is the company that its claims will be substantiated that they offer to send a filter of the required size to any responsible concern on thirty days trial, free, and if found to be unsatisfactory it may be returned, the Capilar Co. assuming all expenses of shipment.

## Mining and Metallurgical Patents.

PATENTS ISSUED JULY 26, 1904

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE WASHER AND SEPARATOR.—No. 765,801; S. B. Wise Whiteoaks, N. M.

Ore washer and separator comprising longitudinally inclined box or casing provided with a screen above riffled bottom, screen and bottom discharging at upper ends, adjustable hangers supporting box at upper end, means at lower end supporting and imparting vertical and horizontal movement to box, whereby material under treatment is tossed toward upper end thereof, in combination with water distributing pan supported above and adjustable independently of box or casing.

APPARATUS FOR HANDLING MINE CARS.—No. 765,902; W. J. Patterson, Pittsburg, Pa.

In apparatus for handling mine cars, combination with elevated structure and shaft therein, of elevator in shaft, track in proper position with reference to elevator, carriage adapted to travel to and from elevator, yielding pusher on carriage in path of car, mechanism for moving carriage.

STAMP SHOE OR DIE.—No. 765,876; W. Brinton, Highbridge, N. J.

A stamp shoe or die comprising outer body of cast and toughened manganese steel having central opening throughout its entire length walls whereof are corrugated; and plug of cast and toughened manganese steel having its surface in engagement and interlocked with corrugated walls of central opening of body.

DRIVE HEAD.—No. 765,864; C. R. Thomas, Hartford City, Ind.

Pipe, collar on end of pipe, drive head bearing upon collar, head having shank which passes through collar and enters pipe, shank next to head being of diameter next to head to make close fit inside of collar.

ORE ROASTING FURNACE.—No. 765,997; G. Shellabarger, Dekalb, Ill.

In ore roasting furnace, furnace body comprising plurality of longitudinally extending separate ore chambers, one of chambers constituting primary ore chamber and others constituting return or secondary ore chambers in communication with primary ore chamber, ore chambers being sealed against admission of products of combustion thereto, plurality of interspersed air passages, and means for supplying air to each of return ore chambers.

DRY PLACER MACHINE.—No. 765,811; J. J. Callahan, Pueblo, Colo.

Combination with suitable support, of tank mounted to rotate thereon and having central post, cruciform frame mounted on post and provided with agitators, one arm of frame projecting beyond periphery of tank, and means connected with projecting arm and acting on tank for simultaneously actuating tank and agitators.

COMPENSATING PIPE JOINT.—No. 765,484; L. Hochstein, Dietrichsdorf, near Kiel, Germany.

Compensation device for pipe conduits, combination with two stuffing boxes connected with each other, of free lying pipe fitting in boxes and open at both ends, and means for leading and carrying off fluid into and out of pipe.

COMPRESSOR.—No. 766,017; I. Carlier, Denver, Colo.

In compressor, combination of motor and fluid chamber, plunger moving in chamber adapted to be reciprocated by motor, tube for admission of air to fluid chamber, second tube for escape of air compressed in chamber by fluid, valves in tubes, coil arranged in fluid chamber and adapted to have liquid circulating therethrough for cooling fluid in chamber, supplemental fluid-receiving tank arranged adjacent to chamber, pipes connecting said supplemental tank with air-discharge tube and with fluid chamber, valves in pipe, and means, including rod, movable vertically at predetermined times for controlling valves.

SAFETY SHAFT FOR QUICKSAND OR OTHER DANGEROUS GROUND.—No. 766,132; R. Baggaley, Pittsburg, Pa.

Means for sinking shafts, comprising casing composed of sections adapted to be successively attached, supporting cables, and wall which is built within casing as it is lowered; casing having a cutting portion at its end.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

The report of the United States Geological Survey shows the output of the coal mines of the United States during the year 1903 was 359,421,311 tons, an increase of 58,000,000 tons, or 19% over the preceding year. The value of the product is given as \$504,190,733, an increase of 38%.

## ALASKA.

Berners Bay reports say the property is showing up satisfactorily. Superintendent J. MacDonald, of Treadwell, says the machine drills have entered 35 feet of solid ore. The quality of the ore in the Kensington mine has increased with depth. The plan is to erect a 300-stamp mill and make other improvements. A townsite has been laid out.

J. Maglott, vice-president of the Mansfield G. M. Co., and G. A. Rusk, treasurer, report the work progressing satisfactorily. About twenty men are employed, and as they have an abundance of water, they will open up several more pits. The Mansfield gold mines (placer property) are on McGinnis creek, near Juneau.

C. H. Cosgrove of Ketchikan reports mining works in that district improving. The Laskawanda G. & C. Co. is increasing work and has its tram, built to get machinery to the property, nearly finished. The tram is 1½ miles long. Assays show the ore to average \$10.

## ARIZONA.

### Coronino County.

The Brannen-Stanley group of mining claims and locations in the White Mesa mining district has been sold to E. T. Merritt of Duluth, Minn., for \$25,000. These claims are about 17 miles southeast of Lee's Ferry and 38 miles northwest of Tuba. Work will start by Sept. 1.

The Hermit G. & C. M. & S. Co. has been incorporated at Salt Lake City, Utah. It owns the Hermit Nos. 1, 2, 3 and 4, in Coconino county. J. W. Lee is president, A. R. Teepler, E. W. Lee and F. J. Barber officers.

### Gila County.

The Pacific M. Co. having deeded in trust to E. Wilder the Clipper group of mines, 8 miles west of Globe, he and associates are forming a company to exploit them. J. D. Copen of Denver, Colo., is manager and is preparing to start work.

The Pasquale Negro group of four copper claims, at head of Pinto creek, near Globe, have been bought for \$17,500 by L. S. and C. W. Gibson. They now own eight claims in one group. The Gibson mine is operated through a shaft 200 feet deep, on which they propose to put a steam hoist. On the Negro group there is a tunnel 500 feet long, and they propose to drive this tunnel 3000 feet or more and by a raise connect with the shaft. The tunnel will strike the ledge 130 feet deeper than the bottom of the shaft at present, giving them that much more stoping ground, and will enable them to run the waste rock out of the tunnel. There is also ore developed on the Pasquale Negro claims, and this will be handled more cheaply through the tunnel and shaft than is possible at present, as it now has to be packed up the hill on burros to be loaded in wagons at the shaft. The Gibsons are delivering ore to the Old Dominion smelter.

### Graham County.

The June output for the Arizona C. Co. of Clifton is reported at 1148 tons of Bessemer copper.

The Detroit C. Co., near Clifton, is enlarging and improving its concentrating plant, which, when completed, will double the capacity for handling concentrating ore.—C. E. Stevenson, superintendent of the Cuprite M. Co., reports that the tunnel is in 170 feet and in ore. The vein is 8 feet wide, with 2 feet of black manganese ore. The company will increase development work.

H. L. Martyr, superintendent of the Standard C. Co. mines, near Clifton, reports to the Clifton-Morenci Mining Bureau that the large amount of development work mapped out by President Ross is under way, and that promising new ground is being opened up. A 25 H. P. engine is being placed in position at the mines, which will take the place of the other two engines, increasing the capacity and also cheapening cost of hoisting ore from the mine. Ore is being shipped, which will be increased later in the season. G. G. Gill, president of the Shannon C. Co., operating the Shannon mine, near Clifton, says the mine is outputting a better class of ore than for some time past, and as a consequence the output from the smelter is also on the increase.

Manager Sweeting has taken charge of the Polaris group and development work

will be increased. More men are being put to work. The ore carries gold-copper values. It is near Clifton.

After a year's steady work from both ends, under Mine Superintendent M. H. McLean, the tunnel driven from the West Yankee and the Old Yankee mines, near Morenci, to connect both workings, was broken through last week. This tunnel will aid in handling the ore from the Old Yankee mine, which will now be worked to its full capacity. The ores will be run through the tunnel to the West Yankee hoist, and from there raised to the surface. In cutting the tunnel, which is 1700 feet long, several bodies of low-grade ore were struck, and the work has answered the double purpose of developing the ground passed through and that for which the tunnel was started. It is estimated that the cost is approximately \$15,000, which will be still further increased before the connection is in the condition the Detroit C. Co. puts all its workings for the safety of its men.

### Morenci County.

The Swiss-American M. Co. is preparing for increased development work on its property at Vivian the coming fall and winter. A new hoist has been set up and the shafts on the Ben Doran and Uncle Sam mines will be sunk farther. The Ben Doran shows a large body of milling ore.

Ore is being shipped from the C. O. D. mine, near Chloride, of the Fletcher M., M. & S. Co. of Needles, Cal., and it is said the stopes show bodies of high-grade ore. The C. O. D. mine is made up of a number of veins. The ore occurs in lenses in these veins and can be worked through one shaft. It is intended by the Fletcher to sink a new shaft to cut the vein near the 400-foot level and work out the old ground completely above that level, and at the same time new ground will be opened out ready for stoping.

### Pinal County.

Superintendent A. C. Sieboth of the Lake Superior & Arizona M. Co., at Superior, near Florence, says he has put in an air compressor. The progress of work at the mine has been retarded by lack of compressed air. Difficulty has been experienced in getting teams to haul machinery and supplies to Superior, owing to railroad construction and work at the Tonto damsite, which has created an unusual demand for teams. The Lake Superior & Arizona is sinking its shaft, having made 45 feet since resuming. There is considerable water coming in.

### Yavapai County.

The George A. Treadwell M. Co. will build a narrow gauge railroad to connect its mines with the main line of the Prescott & Eastern Railroad, thence to the company's smelter at Mayer. Ground has been broken for the new smelter. E. D. Treadwell is manager.

It is reported that Manager G. Bethune of the Yavapai Gold Co. will build a 5-stamp mill on his mine at Mayer.

The Gold & Consolidated M. & M. Co., says Superintendent Pickerell, is expecting to start its mill for the Longfellow group of mines this week. The mines are 12 miles south of Prescott and development work is going on and the bins are being filled with ore.

The Black Rock M. Co., near Martinez, is preparing to put in a mill, with F. Perkins of Salt Lake City, Utah, as superintendent. The mine has a large amount of development work done. The deepest shaft is down 210 feet and is in sulphide ore. There are 60 feet of quartz carrying gold values. The company has a gasoline engine, hoists, machinery, etc. Twenty-five men are at work, but development work is temporarily suspended to put up the mill.

The mill at the Crowned King mine at Crown King, especially constructed to handle the 50,000 tons of tailings accumulated there, started up last week.

Superintendent Pickerell of the Gold & Copper Con. M. & M. Co. says that at the company's Rockefeller group of mines, 12 miles south of Prescott, in Hassayampa district, he is continuing development work and is filling bins with ore and expects to start the mill this week. There are 2 miles of underground workings and the main shaft is down 815 feet.

## CALIFORNIA.

### Amador County.

At the Burlington mine, near Sutter Creek, L. Smith of Chicago, Ill., manager and owner, has men on development work and is putting up a hoist. A two-compartment shaft is being sunk. When the ore bodies are blocked out a mill will be built.

Work is reported progressing at the Fremont-Gover mine, near Amador City, with the non-union crew. Underground work is going ahead and the bins in the mill are being filled with ore.

A gravel strike has been made in the

Butte Basin mine, 3 miles from Jackson, in a tunnel which has been worked for years with little success. A 5-foot deposit was disclosed and gravel is being taken out that goes from 10 cents to \$1 per pan. The number of men working will be increased. W. E. Stewart is superintendent.

### Butte County.

The Gold Mountain mine near Inskip is being actively operated and the 10-stamp mill is running on ore taken from the strike made in the spring. The ledge is 4 feet wide, all of it carrying values. It is free milling. The Diamond Match Co. railroad runs within 8 miles of the property, and will afford means of access. C. E. Clough is manager.

### Calaveras County.

(Special Correspondence).—At the Royal Con. mines at Hodson, a Merton roasting furnace has been built under supervision of the inventor, and it is said to be in successful operation. The furnace is used to roast the sulphides concentrated by the 120-stamp mill, preparatory to chlorination. Chlorine gas for the process is generated by a reaction of SO<sub>2</sub> gas (sulphurous anhydride) on brine (NaCl solution). The gold is precipitated from the gold chloride solution, but is not allowed to settle in the precipitation tanks, but by agitation is kept suspended and the mixture is passed through sawdust filters. These filters collect the particles of precipitated gold, which is recovered by incinerating the sawdust when filled.

Hodson, Aug. 3.

Operations are to be started at the Hamby quartz mine, 2 miles from Mokelumne Hill. This mine is owned by Will & Pink of San Francisco and is under bond to J. King of Mokelumne Hill. There are three tunnels, run 800, 250 and 150 feet, respectively. A drift has also been run on the lead 283 feet and the ore extracted prospects well. A 20-stamp mill will be put in, as well as other machinery, and the work of grading for same has been started.

A 3-stamp mill is on the ground for the Woodward & Fuller quartz mine, near Mountain Ranch. Ore has been taken from the mine and is on the dump, to be milled.

Twenty-two men were put to work at the Sheep Ranch mine, at Sheepbranch, last week. The number will be increased.

The old Stickle hoist of the Utica G. M. Co., at Angels, was torn down last week and a new one will be built in its place.

The Voinich M. Co. is reported preparing to put up a 30-stamp mill on the Voinich mine, west of Angels.—The Prince mine at Altaville, near Angels, has been bonded to C. H. Bean of Los Angeles and J. F. Hamby of Calaveras and first payment made. Work will be resumed in the shaft.

### El Dorado County.

A. K. Grim of Berkeley, president El Dorado C. M. Co., operating at Georgetown, says the company is preparing to put in heavier machinery at the hoisting works and the sinking of the triple-compartment shaft will be resumed. The hoist has been removed from the old Eureka shaft to the works on the hill and work on the Eureka mine suspended for the present.

H. F. Barker and R. M. Crackles of the Rescue M. Co., at Rescue, are arranging for addition of machinery at the Rescue mine, recently bonded. Preparatory work is in progress and the property will be developed. The mine is a gold-bearing quartz proposition. R. M. Crackles of Rescue is president of the company.

The Star mine, near Latrobe, is being developed and is reported turning out \$400 a day regularly. The ore is said to consist of porphyry carrying fine gold. A mill has been built and twenty tons of ore are put through the mill a day. G. H. Jones, T. H. Edwards and W. S. Banks are owners.

### Kern County.

The Associated Oil Co. has a number of gas engines on the ground, near Bakersfield, and will put its wells on the beam. Most of the companies are changing from the pumping jack to the beam on account of the greater efficiency of the latter method of the pumping, says the Pacific Oil Reporter. With an engine at each well it is possible to work the pumps much faster and a corresponding increase in production is the result. Another advantage of the separate engine is that when it is necessary to pull up the pump for repairs the power is always at hand.

Of the companies operating in the Kern River field nine are paying monthly dividends amounting to \$74,500, or \$894,000 per year. The aggregate land owned by these nine companies is about 950 acres, about one-fifth of the proven territory of the field, and less than one-quarter of this 950 acres is developed. There are about 5000 acres of proven oil land in the Kern River field, and less than 1000 producing

wells. A well is said to drain the oil from about one acre of land. The largest factor in the Kern River field is the Associated Oil Co., and the Associated has not yet declared any dividends. In addition to the Associated and the nine companies first referred to is the Petroleum D. Co., which is owned by the Santa Fe Railroad. There are also a number of companies that pay quarterly and semi-annual dividends, and those are also left out of the account. With the profits of these companies added to the amounts already given, it is estimated that the net returns from the Kern River field in the present depressed condition of the oil industry approximates \$2,000,000 per year. These figures are for net profits, with cost of operating, deterioration and betterments taken out. They are made, too, on the basis of the prices which the companies have been getting for their oil—less than 20 cents.

### Mariposa County.

The Champion mine, near Mariposa, has resumed work after a few weeks' shut down. The shaft is down 200 feet. Superintendent Chandler of San Francisco says the ore carries free gold.—The Virginia mine, 5 miles south of Coulterville, is dropping its ten stamps on payable ore. D. O'Toole is owner and manager.

At the Princeton mine at Mount Bullion Manager C. C. Derby has started rebuilding the surface plant destroyed by fire on the 19th ult. The hoist, carpenter and machine shops were burned also and the timbers in the mine shaft to a depth of 150 feet. The 20-stamp mill was saved, also 2000 cords of wood piled near the buildings. Loss is placed at \$75,000, with no insurance. New machinery will be put in.

### Nevada County.

(Special Correspondence).—At the Mountaineer mine at Nevada City, 2½ miles of pipe are being laid to carry water for power purposes. The water enters a 24-inch pipe and is delivered through a 15-inch pipe, 800 feet difference in elevation. The drift has been run into the hill for 800 feet, than a shaft sunk 800 feet on the incline and a drift run back for 1200 feet. A three-compartment shaft will be sunk 675 feet to tap the face of the drift. When the shaft is completed ten more stamps will be added to the 10-stamp mill. The company is figuring on the utilization of the water power for either electricity or compressed air for haulage or other purposes. J. C. Campbell is superintendent.

Nevada City, August 3.

(Special Correspondence).—The Gray Eagle mine and mill at Maybert have been running since early spring when the pipe washouts were repaired. The vein is narrow but high grade, being free milling quartz. A 575-foot crosscut has been run and 450 feet drifting. The mill, tramway and compressor are run by water power, a Tuthill water motor running the compressor. H. Kaler is superintendent. Maybert, August 2.

(Special Correspondence).—In three years 6000 feet of drift have been run at the Union Blue gravel mine at North Bloomfield. A 40 H. P. steam locomotive, burning anthracite coal, handles the cars. These are made at the mine and are provided with wooden bumpers as they are pushed into the mine by the locomotive. Drawbars and chains are provided for pulling them out. The brakes can be set on all four wheels. A No. 4½ Baker rotary pressure blower, belted to a water wheel, furnishes air through a 11-inch riveted pipe. This, with the shaft 2000 feet from the mouth, gives good ventilation. The gravel is given a preliminary crushing in two jaw crushers, run by separate Pelton water wheels. Thence it passes to the 20-stamp mill. This is equipped with 1000-pound stamps and double discharge mortars. The large amount of water used in milling scours the plates, and so four troughs are provided at the lower end to catch the quicksilver and amalgam. Formerly the pulp from the plates was run over riffles, but shaking tables are being put in to effect a further saving. Eighty men are employed. A. D. Gassaway is superintendent.

The Shady Creek Dredging Co. is at work near Cherokee. The gravel is moved by a hydraulic giant, the big boulders separated by a grizzly or trap, and the water and gravel run into a pit and raised by a 6-inch centrifugal pump 50 feet—a sufficient height to allow washing on riffles. This handles 15 cubic yards per hour. The pumps have to be frequently reined. C. L. Miller is in charge.

North Bloomfield, August 2.

The Champion M. Co., near Nevada City, which has for some time been operating forty stamps, is making arrangements to start up the remaining thirty stamps in its mill.

N. P. Brown and F. White have bonded

two quartz mines in Willow valley, near Nevada City, one being the Austin mine and the other the Wedge. Both have been partially developed. The claims adjoin the Murchie mine, and the Independence ledge is said to run through them. It is expected that work will begin next week.

M. Stewart of Rough and Ready has bonded eighty acres of the Kohler ranch on the north slope of Kentucky Ridge and will start men on work of development. The land bonded is north of the Niagara mine and adjoining same, and is said to be on the trend of the ledge in the Norton Ranch mine. Iron gossans are there, an abundance of timber and two springs of water. Stewart will drive a tunnel to cut the gossan, having already struck a 12-inch ledge which he will follow.

A report by President J. D. Hague shows during six months ending June 30, 1904, the North Star M. Co. at Grass Valley produced \$305,000 at an operating cost of \$142,000 and \$53,000 expended for general development of the North Star mine (including the deeper workings of the Central shaft). Further outlays during same period for other developments, mainly at Gold Hill, amount to \$27,000. During the half year the expenditures, mainly for new mill construction and other equipment and including about \$4000 for property purchase, have amounted to \$61,000, whereof about \$37,000 will have been drawn from the surplus fund, which amounted to \$224,000 at the beginning of the year. The general condition of the company's property and business is reported satisfactory. The construction of the 40-stamp mill at the Central Shaft mill was long delayed by unfavorable weather during the winter and spring. It is now nearly ready for operation.

#### Placer County.

(Special Correspondence).—Since the new company has taken hold of the Three Stars mine, near Auburn, under the superintendence of B. F. Hartley, 2000 feet of electric railway have been run to the Almont shaft from the Three Stars 20-stamp mill for ore transportation. This shaft had been sunk 500 feet and was then abandoned. It is now being unwatered and retimbered, preparatory to extraction of ore, which will be hauled. The mill is crushing ore from the 700-foot vertical Three Stars shaft, and also ore from the dump.

Auburn, Aug. 2.

(Special Correspondence).—For six weeks from the first of May water was taken from the 460-foot Gold Blossom shaft at Ophir. Since unwatering thirty men have been at work. Drifts had already been run 1150 feet to the old shaft and the 100, 200 and 300-foot levels. Connection is now being made on the 400-foot level. They are also drifting east and have struck a body of ore. The present working is to verify reports, future progress depending on the outcome. A feature of the surface installation is the placing of the rock crusher half way between the shaft and the 20-stamp mill, which are connected by a tram. This removes the vibrations due to the crusher from both gallow-frame and mill. F. Homer is superintendent.

Ophir, Aug. 2.

#### Shasta County.

The Mammoth copper property, comprising 900 acres of land showing ore blocked out at the mine, near Kennet, in Backbone district, has been sold to F. G. King of Denver, Colo., and J. Filius of Boston, Mass., for \$140,000. They have had it bonded for three years and have expended \$60,000 on development work. Their plans provide for breaking ground for a 500-ton smelter within sixty days. It is thought a railroad will have to be built a distance of 2½ miles to the Southern Pacific main line at Kennet.

#### Sonoma County.

A strike of quicksilver ore has been made near Mark West Springs and it is said San Francisco men have bought Kettlewell, Goodwin and other ranches in that section and will begin tunneling.

#### Trinity County.

G. F. Lewman, owner of the Jo Ham placer mine, above Junction City, reports he has completed his season's work on the mine. In his clean-up was included 6½ ounces of platinum, some of which was in nuggets.

#### Tuolumne County.

In the Don Pedro mine, south of Chinese, a drift has been run 582 feet in ore from the 116-foot level. The steam hoisting plant will be in place next week and operations on a larger scale will be started, says Manager W. H. McClintock.

At the Longfellow mine, near Groveland, the mill is being set up. Superintendent Partington says he expects to start up by August 15th. He bought

the equipment of the Alameda mine, west of Jamestown, consisting of hoisting engine, with 4-foot drum; boiler, gallow-frame, skips, etc. Grading is being done for the hoist and lumber is on the ground for buildings. Drifting is being continued on the 400-foot and 500-foot levels in ore.

### COLORADO.

#### Clear Creek County.

The Fostoria G. M. Co. has arranged to drive the Silver Gem tunnel, near Idaho Springs, to intersect its group of claims at the head of Gilson gulch. The tunnel is in 900 feet, and within 350 feet will reach the Summit vein at a depth of 650 feet below the surface. In the meanwhile connection will be made with the pipe line of the Consolidated Gem M. Co. and air will be supplied from the latter company's Silver Age plant. The mouth of the Silver Gem tunnel is but 300 feet above the Silver Age-Franklin tunnel—Negotiations are pending between the Little Mattie Co. and the owners of the Star tunnel on Chicago creek, for the use of the tunnel to open up the Mattie-Newton vein. The Star tunnel will reach the vein by driving additional distance of 300 feet, and will cut it at a depth of 900 feet from the surface. Besides unwatering the vein to that depth it will be a desirable method of handling a large tonnage of ore to the Mattie mill, located across the creek. The dump of the Star tunnel is almost on a level with the Mattie mill, and by building a few hundred feet of tramway they could be connected. Manager Arkills of the Star tunnel says he will resume work in the tunnel. Several of the veins already cut have ore which can be profitably mined.

Manager Eaton of the Pelican-Dives Co., operating near Silver Plume, says arrangements have been completed for erection of a concentrating mill for treating material that has accumulated during the long period that this property has been operated. Tests have been made on material from the dumps and stopes of the property, as several hundred tons were sent to different mills and the result reported satisfactory. The mill will be located at the portal of the Burleigh tunnel and the motive power for its operation will be electricity. Tramways will be built from the Seven-Thirty and Pelican dumps and the Burleigh tunnel will be driven through to connect with the Seven-Thirty shaft and cut the other lodes owned by the company at that level. The mill will be of 400 or 500 tons daily capacity.

The Democrat Mountain M., M. & L. Co. has been incorporated to operate a group of claims on Democrat mountain, near Georgetown, and has started operations. The number of men will be increased as development proceeds. The group includes the Fred Rogers, Polar Star, Bonanza and other early-day producers. C. I. and K. R. Burt are interested, the company having the property under lease and bond.

#### Dolores County.

The Emma G. M. Co., on the Dunton side of the range from Rico, has completed a 750-foot drift on the vein in the second level and connected the second and fifth levels by a 300-foot raise, blocking out a body of ore 4 feet wide, 300 feet high and 750 feet in length. The main or fifth level is into the mountain 2900 feet and the vein holds out. The second level has reached a horizontal length on the vein of 2500 feet and is also in ore. In addition to doing development work, twenty stamps have been kept dropping in the Emma mill continually and several carloads of high grade ore smelting ore have been shipped to Durango.

The San Juan Ore Co., near Rico, has unwatered the Argentine mine and the extraction of ore has been started. The Pro Patria mill, which is being overhauled by the company, will be in running order this week. The cave in the Pro Patria tunnel is being caught up and ore will be taken out in the Laura workings of the United Rico M. Co. property by the San Juan Ore Co.

#### Fremont County.

F. W. Jones of Boston, Mass., president of the United States Mica M. & Co., says he is shipping mica from his mines at Micanite, in northern Fremont county. The product of the mines at Micanite is free from iron and is adapted for use in electrical industries. The company has expended \$400,000 on its plant. They have uncovered twenty-one veins and holdings cover 240 acres. The mica is quarried. With present installation of machinery, they manufacture into the finished product three tons per day; by Jan. 1st next they expect to double this capacity, says President Jones. The value of mica depends on its size. Sheets approximating a foot square are worth \$13 a pound; but the smaller pieces have their

value. There is no waste in the product. The by-product is ground into a fine powder and sold as "flitter" to wall paper manufacturers. Jones says no raw product is shipped out by his company. Micanite is 20 miles from Canon City by wagon road, but the company will build its own railroad connection with the Rio Grande at Canon City.

#### Gilpin County.

The Quartz hill properties of the Kansas-Burroughs Con. M. Co., near Central City, are employing 100 men on the leasing system. For June the shipments over the Gilpin County Tramway lines were 145 cars, or 1235 tons, maintaining a daily average of 40 tons. Most of this tonnage was delivered to the stamp mills and concentrator at Black Hawk, the balance going to the sampling works. English capital is interested, with R. Skyes as manager. It is reported that the Ridgewood mine (formerly the Rialto), on Lawrence street, will start up again.

#### Gunnison County.

W. S. Chenoweth of Davenport, Iowa, of the Little Tyecon M. Co., owning property in the silver belt 5 miles north of Pitkin, says it is proposed to resume operations. The workings consist of tunnels and shafts. Considerable stoping has been done from a tunnel which is in 400 feet. A shaft sunk 30 feet showed a body of ore 2 feet in width between dolomite hanging and blue lime foot wall that averaged 150 ounces in silver per ton and carries some galena. The property has not been in operation for eight years. Men will be put to work cleaning out the old workings and developments continued. Chenoweth says machinery will be put in.

#### Hinsdale County.

At the Contention mine, near Lake City, Superintendent Kazar is finishing the concentrating mill and increasing work on the Mayflower tunnel, so that mine connections will be made as soon as possible after the mill is ready for the ore. A body of milling ore that makes a solid breast in the Mayflower tunnel has been opened. There has been delay in receiving the machinery.

#### Jefferson County.

Pyritic smelting in Colorado will have another trial in Golden, commencing August 15, says the Times, when the plant built by the Clear Creek R. Co., owned by the Independent S. & R. Co., will resume operations. It will handle the material, to begin with, at the rate of 250 to 300 tons per day, and by November 1st it is expected to have the capacity enlarged to 500 tons per day. As the Colorado & Northwestern Railroad in Boulder, Gilpin and Grand counties, and the Colorado & Southern Railroad in Boulder, Gilpin and Clear Creek counties, have each extended low rates on certain classes of ores for the benefit of the Golden plant, a steady supply is expected. Ores of the higher grades are not solicited. For the present the Golden plant will be a modified pyritic smelter, making a specialty of low-grade siliceous and gold-copper ores. This excludes the lead-silver and lead-zinc material, which may be later provided for in a separate furnace. M. A. Bettman of New York City, N. Y., is president and manager and A. H. Carpenter is superintendent. After the plant gets fully under way the feasibility of extracting sulphuric and other acids from Gilpin and Clear Creek sulphuretted ores, before handling such ores at the smelters, may be taken up. The acid plant would in that case be located on the Colorado & Southern track, between the mouth of Clear Creek canyon and the smelter.

#### Lake County.

(Special Correspondence).—The White Cap M. Co., J. A. Shinn manager, has made arrangements with the Yak Tunnel Co. to operate the lower workings of the White Cap mine through the Yak tunnel. The upper levels of the White Cap are under lease on the block system. The ore bodies from the Moyer and Minnie Lee are said to be trending in the direction of the White Cap, and it is expected to cut a body of sulphide in the Imes dike. The same channel carried carbonates in the upper levels with large values in gold. The lower workings will be worked from a winze from the bottom of the Yak tunnel.

It is stated that a mill will be erected by the Yak Tunnel Co. at the tunnel entrance.

Leadville, July 31.

The boilers have been set up and foundations built for the machinery for the electric plant which will supply the Yak tunnel and workings. Electric haulage and lighting will be used.

#### San Juan County.

A company to operate in Sylvanite basin with claims adjoining the New York-Brooklyn property, near Silverton, has been organized & Grand Junction by

D. Parker, J. J. Lumsin, J. S. Robin and T. Chambers. The company is the Tomkins M. & M. Co. T. Manion, of the New York-Brooklyn group, has supervision of the present summer's work on the new company's property.

Work is progressing at the Ruby T. & M. Co. workings on the Ophir road, at foot of North Lookout mountain, near Silverton. From a lead opened by the crosscut a 20-ton carload shipment of lead carrying gold and silver values is being made weekly, and exclusive of the shipping product, there is said to be a good tonnage of mill dirt. Excavating for a 50-ton concentration plant at the foot of the tunnel is under way, and by October 15 it is expected to be running. The machinery will consist of Cornish rolls, etc. A short side track has been laid from the Red Mountain railroad. Thirty-five men are on the payroll.

The Venetian M. Co., operating at Gladstone, near Silverton, has thirty-four claims. Among improvements contemplated is a 100-ton mill.

#### San Miguel County.

The Bayfield group, in Waterfall gulch, near Ophir, owned by G. Anderson, C. Fredlund and H. Meyers, is making regular weekly shipments of high-grade silver-lead ore to Durango. C. Rittmaster has been given an option on the group. He is preparing to increase development. In addition to values in silver and lead the ore carries gold, and associated with the rich streak is from 2 to 4 feet of concentrating ore. At present the ore is coming from stopes above a tunnel which has been driven on the vein 560 feet. The group comprises nineteen lode claims, a placer and a millsite, and is favorably located for operation through tunnels. A stream crossing the placer and millsite furnishes water for concentrating purposes throughout the year, and on the former there is timber.

#### Summit County.

The Cashier M. & M. Co., operating in Brown's gulch, near Breckenridge, is considering placing additional stamps in the mill. It is said a new ore zone has been exposed in the mine. L. C. Stanton is president.—The larger boiler and air compressor at the Senator group on North Star mountain, near Breckenridge, have been connected up, and the machine drills are in operation in the tunnel.

#### Teller County.

Cripple Creek reports say the Lily shaft on Bull hill is to be used for hoisting the water in that section from the district and for that purpose the Vindicator Con. G. M. Co. has bought the property for \$30,000. The Lily contains 6½ acres of territory. While the ore shoot of the Lily is said to dip into the Vindicator, it is thought further development work may lead to discovery of others. It is the intention of the Vindicator company to use the shaft to drain territory when they resume work of sinking their main working shaft, which will be started by Sept. 1. The Lily shaft is down 1500 feet.

The output of the mines of the Cripple Creek district for month of July is reported showing increase. The United States R. & R. Co. treated 18,000 tons, value \$432,000. The smelters handled 10,000 tons, bringing value up to over \$600,000. The other mills and reduction works will increase this amount. Of the sections which contributed to this tonnage the Gold Sovereign leads, with 1500 tons of average value of \$30. The Last Dollar mine has shipped 1100 tons. This property, since installing the washing machine, is reported saving all values in the rock. Its milling grade returns 1½ ounce gold per ton, with a smelting grade of 4 ounces to the ton. The Doctor-Jack Pot estate during the month sent out 600 tons, with average value of 1½ ounce to the ton. The Rose Maud, since making its recent strike, has sent out 150 tons, but has a total tonnage for the month of 300 tons, with values of three ounces per ton. The Victor mine, on Bull cliffs, a new producer, sent out 150 tons, which returned two ounces per ton.—The management of the Independence, Ltd., has that mine reopened after a month's idleness. This mine will again enter the shipping list. The directors in London have ratified the leases recommended by the local officers. Notices have been sent out to twenty-three of these bidders notifying them that their proposals have been accepted.

### IDAHO.

#### Bannock County.

Pocatello reports say the Inman M. Co., through W. W. Stevens, has closed a deal whereby it bought eight claims on Rabbit creek, 7 miles from the group of the Inman Co., for \$10,000. It has a well developed vein of 40 feet with pay ore uncovered. Stevens states he intends to

start shipping next week from these claims.

#### Boise County.

Work was started last week in the English Co.'s shaft in Gambrinus district, near Idaho City. The shaft was sunk 50 feet before machinery was put on. Superintendent V. Thorne is prepared to continue work to depth of 600 feet.

#### Custer County.

The plant and properties of the Clayton M. & S. Co. at Clayton are reported under option to the Guggenheim Exploration Co. for \$1,500,000. E. W. Nash is president of the Clayton Co. and L. Greene manager. The Clayton mines are equipped with a smelter, which is not, however, in commission. It is said bullion containing lead, silver and gold is stored at the camp, awaiting a less expensive outlet than the wagon road provides. It is thought an outlet by rail will be provided.

The mill on the Lucky Boy at Custer resumed operations last week.

#### Kootenai County.

A large amount of development work is being done in Trussell creek district, says I. J. Brant of Sandpoint. The district is located 1 mile north of Pend d'Oreille lake and 7 miles from Sandpoint. He is developing four claims, largely by open cuts in tracing the courses of the veins, and in doing that work has taken out ready for shipment six carloads of ore which carries \$25 per ton in gold. The ore also carries 4% to 6% lead. Considerable work is being done on a group of claims owned by Johnson & Co. of Spokane, Wash. The vein is 4 feet between walls. Brant says they are looking forward to completion of the Panhandle smelter at Sandpoint, as they will then be able to market ores at nominal transportation charges.

#### Shoshone County.

Mines are being opened by the True Fissure M. Co. on Gold Hill. They are owned by W. J. McConnell of Moscow and they are doing extensive development work. They are also making ready for a mill which they propose erecting this summer. Three nearly vertical falls, from 80 to 125 feet, in a creek directly under their claims, give them a natural mill-site. Added to this, the claims can be worked from a tunnel running directly into the mill. It is 25 miles in an air line to the nearest point on the Coeur d'Alene branch of the Northern Pacific. It is 65 miles from Missoula, Mont. A 25-mile wagon road from Gold Hill to Lo Lo Hot Springs, Mont., will connect Gold Hill with Missoula.

### KANSAS.

#### Cherokee County.

At Baxter Springs the plant of the Ford & Troupe mine is grinding out ore. Another drill hole is being put down on the Angel land near the lead strike. The Sunny Side mine is hauling ore for shipment. J. T. McRuer, of Parkville, Mo., is putting in a boiler and pump for his mine on the Ford & Troupe lease, and will continue sinking until the body of ore shown by the drill is reached.

### MISSOURI.

#### Jasper County.

The Carthage Lead & Zinc Co., which is sinking on the Palmer land at Kendricktown, has put in a steam pump, also a steam hoist. They are down 100 feet and are said to be within 20 feet of ore. Men have been put to work in the Monitor mine, west of Carthage, which has been idle for three weeks on account of wet weather. They have started drifting. A night crew will also be added to continue sinking, it being intended to carry the shaft down to the lower run of mineral while still developing the upper drifts.

The Independence mine and lease, consisting of 160 acres, near McKinley switch, north of Joplin, has been sold for \$40,000 to T. Rhodes of Chicago, Ill., and T. J. Schmitt. They will prospect the land extensively. There is one mine on the lease—the Independence—producing ore.

The Independence M. Co. of Joplin has been incorporated. C. B. Wolcott, W. P. Betts, H. A. Wolcott, H. L. Baird, W. E. Evans, M. K. Salsbury, J. A. Wilson, R. A. & J. Balph, C. B. Judd, G. M. Jones and J. M. Young have incorporated the Pittsburg-Missouri Zinc & Lead Co. in Carthage.

The Pearson-Sayers M. Co., on the Picher land, is sinking on a drill hole prospect, having six holes down, showing 70 feet of ore. The shaft is down 120 feet and lead was struck at 110 feet. Zinc ore of payable quality is being obtained with the lead.

There seems to be a scarcity of shovel hands in the mines around Cartersville. Two mines—the Brass Ring and the Majestic—have shut down on account of lack of hands. T. Coyne's mill has started

operations. It is equipped with machinery run entirely by electricity. The Opal Wonder mine has been leased to H. Tibbons et al. Repairs are being made and work will begin next week.

The Stepp & Kaiser plant is operating on the first lease on 175 acres of the J. C. Guin land, near Cartersville. They have built a mill and office. There are five new mills on this ground and all are working in ore. Stepp & Kaiser average 7½ tons of jack per day, and report lead enough carried in addition to pay the labor.

Notwithstanding the mines have generally all been restarted and the output increased, the sales last week were only 340 tons of zinc ore more than the previous week, says the Joplin News-Herald. The highest price reported paid was \$40 per ton and the assay basis was \$35 to \$37 per ton of 60% zinc. The companies paying the highest assay price are the heaviest buyers. So long as the shipment continues as large as last week, and the mines that are now closed down from water, directly or indirectly, remain out of the outputting class, the reserve stock will increase slowly. Nearly all producing plants are in operation and the output will be increased. Lead remains firm at \$54 per ton, \$1 higher than last year. Mine operators expect the market prices will remain around the \$40 mark. The shipments of spelter for export are said to be increasing. Besides the 1000 tons said to have been recently sold to Japan, 600 tons have been sold to an English firm to relieve a shortage there.

#### Lawrence County.

Aurora reports say the I. X. L. Co. is arranging to sink another shaft on its lease, work to begin this week. The shaft will be put down to open a body of lead that has been drilled into in the bottom of one of the drifts and considered too far from the shaft to make it profitable to develop without sinking a new shaft. The shaft will be put down to a depth of 200 feet.

At Aurora work is progressing in shafts on the United Zinc Co.'s ground, and several feet have been added to the depth of the new shaft, and this fall two new mines will be in operation in that quarter of the camp. The Myrtle J. and No. 4½ mines on the Boston-Aurora land, which have been shut down, may be started up this week. The development at the No. 1 mine on the Boston-Aurora ground is reported showing up satisfactorily. Hudson, Griffith & Co. report making a weekly output of 25 tons of silicate at their mine on the Black land.

### MONTANA.

#### Broadwater County.

E. J. Morison of Townsend says the outlook is favorable for beginning work on the placer deposits on Indian creek by Sept. 1. The deposit is in the bed of Indian creek, 2½ miles from Townsend. He says it runs on an average of \$1 a cubic yard from the grass roots to bedrock, with an average depth of 12 feet. It is intended to put on three shifts of seven men each. Electric power will be used to run the machinery. The power will be furnished by the Missouri River Power Co.

#### Fergus County.

The Kendall G. M. Co. reports making \$25,000 profit per month on \$6.50 ore. The property, controlled by Finch & Campbell, is at Kendall under management of H. H. Lang. The mine is developed by open cuts and by a 500-foot incline shaft, with levels at regular intervals. The vein strikes northeast-southwest along a lime footwall. A dike of porphyry cuts the vein at right angles and the richest ore is on contact of the lime, shale and sandstone with the porphyry. At the 200-foot level the vein has an average width of 125 feet, with a dip of 65°, says the Spokesman-Review. The ore is a quartz porphyry with principal values in gold, there being a trace of silver. It is suited to cyaniding, 300 tons per twenty-four hours being treated by that method. The ore is crushed to ¼-inch size before placing it in the leaching vats, each of the latter being 22 feet square and 8.5 feet deep, built of steel, twelve in number, holding 170 tons each of dry ore. Seven days are required for leaching; three pounds of cyanide per ton of water is used as strong solution, this being followed with a weak solution in which one pound of cyanide per ton of water is used, and finally by a wash of fresh water. In precipitation by zinc shavings the consumption of zinc amounts to 0.33 pound per ton of ore treated. The ore, as fed to the mill, averages \$6.50 per ton, the extraction being 90%. Superintendent Lang states the cost, including mining, milling and development, averages below \$2 per ton of ore treated. Everything is run by electric power and seventy-five men are employed. The Barnes-King M. Co. mine is on the same ore zone as the Kendall. The Barnes-

King, however, is wholly within the lime, the vein being 30 feet wide, with a dip of 35°. It is opened by surface cuts and a 270-foot shaft. The collar of the shaft is 200 feet below the apex of the vein. From the 100-foot station an 800-foot drift has been driven; a 600-foot level has been run from the 200-foot station. A 200-foot winze has been sunk in ore from the 200-foot level. The ore comprises altered lime with some sandstone. The values are in gold, with a slight trace of silver, said to average \$9 per ton. The gold is extracted by cyanide. Thus far, the ore is well oxidized. It is found necessary to mix the sandstone and lime ores in the vats to overcome the free slacking of the latter. Superintendent H. I. Shaw says they use 0.3 pound of cyanide per ton of ore, and that the consumption of zinc in precipitating amounts to 0.25 pound per ton of ore treated. E. W. King is manager. The mill is handling 160 tons of ore daily. The Golden Discovery group and others are being developed on the same belt.

#### Missoula County.

The Denver & Rock Island Dev. Co., composed of Pennsylvania mining men, has been incorporated to develop the Rock Island group of claims, formerly held by the Duquesne M. Co. The claims were sold at sheriff's sale in Missoula and bid in by A. Lutz of Pittsburgh, Pa. The mines are north of De Borgia and are said to be in the same silver-lead belt as the Shoshone Co., Idaho, Coeur d'Alene mines, but on the opposite side of the summit of the Bitter Root range. The property is a concentrating proposition and there is also ore that could be shipped. The ore contains silver and lead values.

#### Silver Bow County.

The known area of the copper deposits of Butte district is being widened by explorations from the working mines, says C. J. Fitzgerald. The Speculator Co., owned by the Largey estate, has struck a new body of high-grade copper ore in a crosscut run 1000 feet from the 1200-foot level of the Speculator mine, the ore being in the Jessie ground, one of the original claims of the Speculator group. This strike occurred in territory outside of what were heretofore considered the boundary lines of the copper deposits on Anaconda hill. A good body of copper ore has also been opened by development work carried on by H. L. Frank in the Gem mine, which is also near the boundary of the copper zone. The fact that copper ore is constantly being uncovered by exploration in the old silver producing mines warrants the expectation, says Fitzgerald, that the copper deposits extend under the silver belt of Walkerville. The Anaconda mine, now a copper producer, was originally located and worked as a gold and silver mine.

### NEVADA.

#### Lincoln County.

H. J. Norris of Boston, Mass., interested in the Seven Devils gold-copper claims, 15 miles north of Muddy Springs, near Moapa, says a company will be organized to open up the properties, build a smelter and do development work.

By fall twenty stamps will be dropping in the Quartette mill at Searchlight. Preparations are being made for ten additional stamps. A number of men were laid off last week, as the many improvements, together with a great deal of development work, are completed. It is claimed that but five men are required to keep the 10-stamp mill supplied with ore. The electric pump is at work in the shaft, the Cornish pump will not be used until sinking is resumed, says Superintendent Harrington.

#### Lyon County.

It is reported the Southern Pacific Railroad has decided to build a cutoff 27 miles in length from a point 8 miles north of Wabuska to Hazen, 7 miles east of Reno, thus saving the long haul up the grade to Mound House, and considerably shortening the route to Salt Lake City, Utah, which would benefit the shippers of ores from Tonopah district. The only point now to be decided is whether the road from Hazen to Wabuska shall be narrow gauge or standard. In the former case the Western Ore Purchasing Co. will build a sampling plant at Hazen, but if the standard gauge is continued to the Wabuska end the sampler would be installed there. This latter plan would be preferable, as it would enable the smelters to handle the tonnage of low-grade copper ore blocked out at Yerington, which, however, cannot stand the cost of reshipment.

The Central G. M. Co. has been incorporated by Connecticut men to operate near Silver City. The company has bought the Lillian & Hope property, adjoining the Golden Eagle and Brodek, and is developing it through the Zadig-Keating drain tunnel, which will cut the old

workings of the Lillian & Hope 300 feet below the surface, where there is said to be a vein of pay ore. A crosscut is being run from the tunnel. A blower operated by a gasoline engine has been set up in the main tunnel, which furnishes ample supply of good air for development work. C. H. Glines is superintendent.

#### Storey County.

An examination of the Union shaft at Virginia City, made through the drain tunnel, shows that the shaft at that point is not damaged. The pump shaft is now clear of debris, but the main shaft is not yet entirely cleared. The work of retimbering the shaft has been started.

#### White Pine County.

Work has been resumed at the Pilot Knob copper properties at Ely.

### NEW MEXICO.

#### Grant County.

The output of the Chatham smelter at Silver City will be increased, as recent development work on the company's mines in the Burros mountains are said to be showing additional ore bodies. Since the smelter has proved successful, many of the smaller miners have decided to resume work on their claims. The main portion of ore handled by the smelter at present is the output of the company's mines, especially the Virginia. The ore from the latter is high-grade copper, carrying gold and silver. A body of ore has been uncovered at a depth of 150 feet. The smelter employs 150 men.

#### Lincoln County.

The Montezuma M. Co., J. M. Blocker of Bridgeport, Tex., superintendent and director, is preparing for active operations on the company's property near Nogal.

#### Luna County.

R. C. Ely of Deming, with New York and Pennsylvania men, has organized the Luna Lead Co., with the following officers: S. R. Bush of Easton, Pa., president, and J. T. Duryea of New York secretary and manager. The company owns properties in Luna and other counties and will build a smelter at Deming for treatment of its ores.

#### San Miguel County.

The Blake M., M. & I. Co. at Las Vegas is preparing to equip a 50-ton reduction plant with leaching and settling tanks. Steam power will be used.

#### Socorro County.

The Carthage coal fields at Carthage are reported sold to P. Stackhouse of El Paso, Tex., of the Colorado F. & I. Co. Their development heretofore has been hindered by lack of transportation facilities. It is understood the new owners intend to build a railroad to the fields either from the Santa Fe or as an extension of the Santa Fe Central.

### OREGON.

#### Baker County.

The 10-stamp mill, started in operation on December 15th last, has not missed a day's operation since, and last week they started the sawmill cutting timbers for the buildings in which will be put the deep-sinking plant and air compressor, says F. D. Smith, manager of the Snow Creek mine, near Greenhorn. The machinery will comprise a hoist of 1000 feet sinking capacity and a 4-drill air compressor. The shaft will be sunk at a point 550 feet from the portal of the present working tunnel, a raise of 120 feet having been completed to the surface. The shaft will be extended 200 feet, and then crosscutting to the vein will be started; in the meantime the mill will continue to treat the ore from the present drifts. The concentrates and shipping ore will be sent to Sumpter. The placer mines, for which the company has obtained a patent, are being put in shape for operations the coming season.

T. Lee of Cincinnati, Ohio, of the Alpine Con. G. M. Co., owning the Alpine mine at Cable Cove, near Sumpter, says he has ordered a resumption of operations in the mine and the finishing of construction of a 20-stamp mill, the machinery for which is on the ground.

Arrangements are being made for resumption of operations on the company's mines near Sumpter, says S. M. Moulton, treasurer of the Turnagain Arm Co. The mines include the California in Cable Cove, the Cracker-Oregon and Cracker-jack properties. Work will resume at the California, says Moulton. Tests have been made of California ore during the past winter, and they are prepared to continue milling operations. Roads are opened to traffic to the Cove. The county has been doing improvement work and the mining companies also, and between the two they are eliminating the traces of last winter's snow and this spring's floods.

As the California got caught short of chemicals and other supplies for the leaching plant last winter, work was suspended until the same could be provided. Work will be increased at the Cracker-Oregon, the management contemplating development on three levels of the mine.

E. F. Zinns of Houghton, Mich., has a bond on the Climax group near Bourne. Zinns has till October 1 in which to start development work and make first payment. The Climax group is owned by G. W. Grayson of San Francisco, Cal. There are four full claims in the group, which adjoin the Columbia mine, and is near the Golconda and North Pole and Taber Fraction. In the Columbia No. 2, the Climax group picks up the broken ledge which was dropped in the Columbia on the 300-foot level. The Climax has been developed by several thousand feet of tunneling, crosscuts and raises. Ore is blocked out. The ore assays \$6 in gold and is mostly free milling. The Climax carries water and timber rights. Zinns expects to put on men to extend the lower and upper tunnels, and it is thought they will also sink.

W. L. Vinson and W. J. Patterson of Baker City have a bond on the Watson placer mines and water power on John Day river. This embraces 600 acres. Arrangements have been made to equip the mine with hydraulic machinery, for which there is said to be an abundance of water available.

#### Yamhill County.

The Red Jacket M. Co. of North Yamhill reports a portion of the underground workings of the mine have been lost through a cave-in. The property is on Trout creek. The cave occurred below the 200-foot level, and more than 100 feet of the main shaft is said to have gone in. The shaft penetrated soft ground at that point, and the timbering was not sufficient to withstand the great weight to which it was subjected. The extent of the damage is not known. Work has been begun to remove the debris from the tunnel. The company had just put in a steam plant, with pumps and new machinery, and was planning to clear the mine of the small amount of water remaining in the workings. It is considered possible that a new shaft will have to be sunk. It is thought ore shipping will be delayed several months. A large vein of ore had been cut on the 350-foot level. A heavy flow of water struck at the time the vein was tapped is considered responsible for the damage.

### SOUTH DAKOTA.

#### Lawrence County.

The first shipment of ore from the Black Hills to the South Dakota gold reduction plant at the World's Fair at St. Louis was sent out last week by the Golden Reward from its mine in the Bald Mountain country, west of Lead. The initial run of the stamp mill at the Fair grounds will be made on this ore. Shipments from other mines in the Black Hills will follow, and the mill will be kept in continuous operation until the close of the Exposition.

The Commonwealth M. Co. has been incorporated by W. F. Dutton, P. N. Stankovitch, V. W. McKay, S. E. Crans, J. J. Morrow, L. B. Bailor, E. J. Barklow and J. Smith, with principal place of business at Lead. The company owns thirty-five acres of mining ground adjoining the Globe M. Co., west of Lead. It is intended to sink a shaft and crosscut the formation in both directions. W. F. Dutton, of Lead, is president, and P. N. Stankovitch is manager.

W. L. McLaughlin, manager of the Horseshoe M. Co., says the Horseshoe mine and mill, near Deadwood, are again in full operation. Production for June and July fell below average, due to heavy rains and consequent flooding of the Ben Hur workings. The Ben Hur has been unwatered, the mill is dropping seventy stamps and regular shipments are being made to the smelter. The Snowstorm shaft has been unwatered and ore is being taken out from the Ben Hur mine through this shaft. An arrangement has been made between the company and the Snowstorm owners whereby the former gets the use of the shaft. Ore will be raised by a skip, from the shaft to the Burlington railroad tracks above.

J. Bylow, of the Hidden Spanish M. Co., says the company owns 200 acres of mineral land 5 miles south of Lead, adjoining the ground of the Wauconda company. It is developed by a shaft 140 feet deep, equipped with a steel whim. Developments show payable ore. Preparations are being made for resuming operations and to increase development.

The framework for the mill of the Gilt Edge-Maid M. Co. in Bear Butte district, near Galena, is up, and lumber and other building materials have been delivered for completing the structure. It is ex-

pected to be ready for service by Sept. 1st. Right of way has been secured by the Belt Electric L. & P. Co. from Pluma to the site of the mill, and the poles are being set. The plant will have an initial capacity of 130 tons of ore a day, and provision has been made for doubling its capacity without addition to the building. One Chili mill will be put in. G. A. Duncan is manager.

Mining operations are reported increasing around Custer Peak, near Roubaix. The Custer Peak M. Co., owning 400 acres southeast of the peak, has completed installation of a plant, including a 75 H. P. boiler, single-drum hoist, 8 drill air compressor and pumps. An assaying laboratory will be built. The main shaft is down 75 feet and will be continued several hundred feet. J. H. O'Brien is superintendent. The Amazon, which has been closed due to litigation, is again in operation, by F. A. and C. Sherman of Pactola. It is equipped with a stamp mill. Adjoining the Amazon, the Sherman Bros. have opened and are developing a body of free milling gold ore.—It is said C. Donaldson et al. of Minneapolis, Minn., have a group of copper prospects in the same district and are developing with a shaft.—It is reported a deal is pending for sale of the St. John group, north of Box Elder creek, 2½ miles southwest of Roubaix. It is equipped with a hoist and 2-stamp mill.

#### Pennington County.

The North Fork M. Co. has resumed operations near Keystone, and President H. B. Leonard is in charge.—New discoveries of quartz and placer gold are reported from Spring Creek, near Rockerville. The owners are S. Rush and D. Phinney.

G. M. Thresher of Berton Harbor, Mich., of the Black Hills C. M. Co., says at the company's property on Copper Reef mountain, 5 miles from Rochford, work will be resumed next week. The property is developed by an incline shaft, which has attained a depth of 800 feet, and much lateral work has been done. Drifting was done in an easterly direction from the shaft the past spring, but owing to water struck work was suspended until pumps could be put in. It is expected the east drift from the incline will cut the main ledge. The company owns 510 acres of land taking in Copper Reef mountain. The property is equipped with a plant of machinery. J. B. Taylor is superintendent.

### UTAH.

In the ore and bullion market the settlements for month of July aggregated \$1,644,103, which, during same period last year, amounted to \$1,829,250, says the Salt Lake Tribune—this, too, with increasing production by the mines. Manager Whitley of the American S. & R. Co., explaining the shrinkage in the settlements notwithstanding the increased production of ores, says a short output of ores in Colorado during hostilities in that State had made it necessary for his company to forward a larger volume of ore to its smelters there. The Utah settlements are accordingly deprived of this credit, and hence the apparent shrinkage in the output of Utah. July, at the copper smelters, closed on an output of copper bullion, containing gold and silver, amounting to 3,207,896 pounds and of a value of \$750,000, the output from all sources, including that produced at the furnaces of the American S. & R. Co., showing a total of 4,223,896 pounds. Nor were copper producers permitted during the month to show their strength. On the contrary, not one at Bingham but is capable of doubling its present output. However, the gains over the same month in 1903 have been pronounced. August promises an increased production at each of the plants.

#### Beaver County.

By Sept. 1st it is expected Contractor J. Dederich and his men will finish the concrete work at Newhouse, near Frisco, where the concentrating mill for the Cactus mine will be erected. By that time the railroad from Frisco will be completed and much of the material for the various buildings will be on the ground. Altogether Dederich is working 100 men in putting in the concrete foundations and in grading the Newhouse Co.'s railroad, over which the ores of the mine will pass from the tunnel entrance to the mill. The line will be 2 miles long. In the meantime machine drills are busy in the tunnel which is to connect with the 600-foot level of the mine. The distance has been reduced to 1300 feet, and with men working from both sides good progress is being made. S. Newhouse of Salt Lake City says he expects to have the adit finished in November.

#### Box Elder County.

The output of the Century mine for the

first half of July was \$8000, notwithstanding the mill has not been kept running up to normal on account of the necessity of making repairs, says Assistant Manager V. R. Madsen. He shipped a gold bar of \$3000 value, a carload of concentrates from which \$2000 were realized, and 1000 pounds of high-grade concentrates valued at about \$3 a pound.

#### Carbon County.

Two-thirds of the miners working at the Pariette gilsonite mines have been laid off indefinitely, the management giving as the reason that there is at this time no market for the product, says the Price Advocate. The mine has been producing for the past thirty days twenty-five tons a day and this ore is stacked up at the mine ready for shipment. The shaft at the Pariette is down 525 feet, where the ore in the drifts is 4 feet wide, but the average of the vein is 20 inches. The second class stuff is on top of the vein and the first grade at the bottom. Lately a small flow of gas was opened and this makes bad air in the property. The gas vein has been plugged. D. Raustrom, superintendent, says the ore now stacked at the mine will be taken to Price and shipped to Chicago, Ill.

#### Juab County.

A Tintic report says C. H. Blanchard is preparing to open up the King William ground, adjoining the Grand Central, near Eureka.

Eureka reports say shipments from Tintic district for the week ending July 30 amounted to 107 carloads, the producers being: Bullion-Beck 5, Gemini 12, Centennial-Eureka 42, Joe Bowers 1, Granite 1, Eureka Hill 2, Eagle & Blue Bell 1, Uncle Sam Cons. 3, Yankee Cons. 5, Mammoth 20, Grand Central 11, Lower Mammoth 1, Ajax 2, Victor Cons. 1. The Uncle Sam mill shipped three cars of concentrates and the Eureka Hill mill four carloads.—For the month ending June 30 the shipments from Tintic district were as follows: Ajax 9, Mammoth 72, Grand Central 71, Victor Cons. 4, Lower Mammoth 4, Carisa 9, Bullion-Beck 22, Gemini 66, Laclede 1, Centennial-Eureka 220, Eagle & Blue Bell 8, Yankee Cons. 27, Tetro 3, Uncle Sam Cons. 10, Sunbeam 4, South Swansea 1, Joe Bowers 1, Granite 1, Eureka Hill 2; total, 535 cars. Concentrates—Uncle Sam mill 24, Eureka Hill mill 4, May Day mill 1; total, 29 cars.

The movement of copper, gold and silver-bearing bullion and high-grade concentrates from the mill with first-class ore from the mines has been resumed by the management of the Eureka Hill Co.'s plant at Eureka, Tintic district. The bullion goes to an Eastern refinery, the concentrates and ores to the furnaces of the United States M. Co. Since the company's mill went into commission bullion and concentrates have each been piling up until, says Manager Fox, there are 600 tons of the former, with a considerable volume of concentrates. But a portion of the battery of stamps with which the mill is equipped is dropping at present. For several years the Eureka Hill mill was hung up while ore shipments were desultory. During that period, however, a large volume of milling ore was blocked out.

Preparations to continue development of the Lucy L. Co. properties at Clifton, west of Fish Springs, in the Deep creek country, are being made, says F. L. Wilson, manager. Copper ore with gold values has been opened up.

#### Millard County.

The management of the Copperhead M. Co., whose properties near Oasis are being developed, shipped a trial lot of ore last week, which was sold on controls showing \$17 gold, 12.5 ounces silver and 4.3% copper. The ore bodies are being opened up under direction of Superintendent J. Clive.

#### Piute County.

The Signal Peak M. Co., operating in Gold Mountain district near Marysville, has a group of twelve claims at head of left fork of Fish creek, 2 miles south of the Annie Laurie mine. D. D. Hanks of Eureka is president and J. H. Nelson director and manager. The surface showing at the Signal Peak is that of three veins, trending north, 125 feet and 300 feet apart on top. The apparent dip of the three is expected to bring them together. The east ledge is 12 feet wide, the middle 6 feet and the west 10 feet. The main working tunnel, driving east to tap the ore bodies, has reached the length of 325 feet. According to surveys a total length of 770 feet will carry it to the ledge. At that point the stopping depth attained will be 500 feet, says Manager J. H. Nelson. It is estimated that an average of \$9 per foot, or about \$7000, will complete the tunnel to its destination. A thousand feet of air pipe, a fan and water wheel are on the ground for use in the tunnel. Timber and water are abundant.

—An air plant has been put in at the Annie Laurie Extension mine and the tunnel is progressing toward the ledge. Manager S. Black has men drilling to the lead of the Richfield M. & M. Co. group on Deer creek, near the Butler-Beck.

#### Salt Lake County.

The Deems group in Bingham has been organized as the Deems M. Co. The officers are: C. D. Rooklidge, president; J. P. Spaulding, A. Hanauer, Jr., J. E. Kauffman and J. P. Megeath.

W. A. Sherman has an option on the Julia S group of mining claims at Bingham for \$60,000. The property has been productive of high-grade ore and Sherman will increase work.

The Heaton jiggling plant in Bingham canyon, near Bingham, has, with its water right, been sold to E. A. Wall, and will be used in the reduction of Kempton ores.

#### Summit County.

An attempt was made last week to destroy the hoisting works of the St. Louis-Ontario M. Co. at Park City by dynamite. The work was done while Superintendent Lapelt and his men were at dinner. Investigation proved that giant powder had been placed under the buildings and that it had been touched off by a long fuse. The force of the explosion threw the corrugated iron sides of the building out, tore off part of the roof and destroyed the hoisting bucket and a heavy mine car which stood near the collar of the shaft.

The work of putting up the hoisting plant to replace the one destroyed at Ontario shaft No. 3, near Park City, is progressing satisfactorily. The gallowa-frame is in place and the machinery is being set up.

#### Tooele County.

The Katharine, a former producer of Stockton, will resume operations this month.

G. St. Clair, manager of the Chloride Point mine on Lion hill above Ophir, says he is shipping ore averaging 300 ounces silver with \$2 gold per ton, with silver sulphides. At a vertical depth of 400 feet from the surface the main ore body is being opened up. It is from 2 to 6 feet between well-defined walls, dipping at an angle of 35°. The second-class ore is being piled up. To reduce this, says St. Clair, he will use pan amalgamation, which will replace the cyanide process with which the present plant was equipped several years ago. Alterations at the present mill will be made and the substitute process installed as soon as the volume of milling ore justify it.—At the Northern Light, same locality, G. Weston has uncovered another shoot of ore at the grass roots, and is extracting rock while developing it along the strike. At the Clark mines and mill in Ophir canyon operations are again in full blast, with fifty tons of concentrates produced daily, while at the Ophir Queen streaks of high-grade ore are occurring in the second class, for the treatment of which later a mill is under consideration.

The management is preparing to reduce the large tonnage of arsenical ore that has been blocked out in the properties of the Sacramento G. M. Co. at Mercur. The ore body underlies the oxidized zone, on which latter the company has been drawing for several years, and, while it is refractory and will require roasting, it is expected it will be made to afford a margin. Of the supply of mercuric ores Treasurer McConaughy says the output of quicksilver has been active, the ores have maintained a good average and the stoep from which they have come is comparatively a small one.

### WASHINGTON.

#### Okanogan County.

T. James of Spokane, interested in Slate Creek mining district, in the Cascade mountains, near Twisp, says the Mammoth is running a 10-stamp mill and the North American Co. of Minneapolis, Minn., has a 10-stamp mill on the road. The Mill Creek mine intends to get a mill. The Eureka M. Co. has to remodel its 10-stamp mill and to resume underground work. The Mammoth and the North American are each working thirty-five men.

J. C. Hass of Spokane and W. F. Smith of Greenwood, B. C., have a bond on the Copper Queen, the No. 9, Golden Curry, Neutral and Aztec claims on Copper mountain. They are ½ mile east of Bolster. Work will start this week. The showings on these claims are deposits of iron-copper ore.

Nespelem reports say the Multnomah M. & M. Co. is driving its tunnel ahead and is in 590 feet, the breast of the tunnel showing mineral. They have cut two ledges that assay in gold, silver and copper. The company owns twelve quartz claims and several placer claims on the Columbia river which are patented. It

also owns the water right of the Nespelem river, which will give them power.—Four claims of the Croll group have been bonded to Lind & Oleson, and they are sinking on the Pittsburg and are down 60 feet in silver ore. They are working four men. The Doubleheader and Little Chief will start up this week.—The Pacific Coast M. & M. Co. has stopped work temporarily while putting in machinery. They are down on the Seattle claim 150 feet and have crosscut 90 feet. The ledge is 85 feet wide on that level. The company has worked sixteen men all winter.—Cook & Yates of Republic will start up work on the Last Chance mine, a high-grade silver proposition.

#### Stevens County.

Northport reports say the Last Chance M. Co. tramways are completed and horses and mules are being used to haul ore from the foot of the first tramway, at the bottom of the hill below the mine, to the top of the one on the hill above the smelter, a distance of about 6 miles. The ore will then be shipped by rail to some lead smelter. It is said that a body of silver-lead ore is blocked out and that at least one carload of ore a day will be shipped. It is also said a small smelter may be built either on the flat below the mine or in Northport.

## FOREIGN.

### AFRICA.

#### Rhodesia.

The Ayrshire G. Co., near Bulawayo, reports for month of June 6950 tons of ore crushed, 2150 ounces of gold recovered; value, £8550. Mill worked twenty-two days, sixty stamps running. Average value of tailings assay, 3 dwts. The full battery of sixty stamps ran from the 13th; thirty stamps ran the full month, equivalent to twenty-two days' run for sixty stamps.—The Globe & Phoenix G. M. Co. for June reports forty stamps ran twenty-seven days, crushing 5640 tons of ore; duty per stamp per day, 5.03 tons; yield, 2538 ounces bullion. Tailings: average assay value per ton, 2.36 dwts. (fine gold). Cyanide: tons treated, 3550; yield, 491 ounces bullion. Total 3029 ounces.

The Rezende Co. during month of June had twenty stamps running twenty-eight days, crushing 2850 dry tons; recovered from mill, 940 fine ounces; recovered from tailings by cyanide, 216 ounces; total, 1156 ounces fine gold. In addition, 14 tons concentrates were produced, containing 84 ounces fine gold.

### AUSTRALIA.

#### New South Wales.

The annual report of the Department of Mines of New South Wales has been issued, showing aggregate value of metals and minerals produced in the State to the end of the year 1903 to be £158,339,798. Production for the year 1903 was £6,059,486, being a net increase of £421,341 over that of 1902. All the principal minerals show satisfactory increases in value. The most important increase was in the production of copper, and amounted to £122,263. Decreases were in the output of gem opal and oil shale.—Under the heading of gold the product to the end of 1903 is placed at 14,071,700 ounces, valued at £51,822,617. The production of gold from ores, etc., mined in the State during 1903 was 254,260 fine ounces. The principal producing field during the year was the Cobar, which turned out 79,860 ounces of gold. A statement of the yield obtained by dredgers during the past four years shows an increase from 8882 ounces in 1900 to 27,238 ounces in 1903, the increase over the previous year being 1764 ounces. The chief center of gold dredging operations is in the Araluen division. There were fourteen plants at work there at the close of the year, and they contributed 53% of the value of the yield obtained by that branch of the industry. Satisfactory yields were also furnished by the dredgers operating in the Stuart, Tom, Tingha, Adelong and Sofala divisions.—The quantity of coal produced in 1903 was 6,354,846 tons, valued at £2,319,660, as compared with 5,942,011 tons, valued at £2,206,598, for the previous year. The Northern district was the largest producer, giving 4,410,565 tons, while the Southern district contributed 1,476,005 tons and the Western district 468,276 tons. The total production of "keresene" shale for 1903 was 34,776 tons, valued at £28,617.—The estimated net value of silver, silver-lead, concentrates, ores, etc., for 1903 was £1,501,403, and with lead and zinc added the total value was £1,626,576.—From ores raised in the State during the year the value of the copper produced was £431,186, as compared with £308,923 for the previous year. The increase in value of production was in the main contributed by the mines at Cobar and Burraga. The quantity of tin ore obtained

by the dredgers during the year amounted to 244 tons, valued at £20,100. At the close of the year there were six plants, equipped primarily for saving tin, at work, while three dredgers were saving tin as well as gold. Several additional plants were on the point of starting operations, and others were in the course of construction. The output of tin ore during 1904 is, therefore, expected to be largely augmented from this source. The number of plants in commission at the end of 1903 was forty-one, valued at £253,480. Four plants were idle during the whole year, and three others were dismantled owing to operations being proved unremunerative.—The estimated quantity of diamonds won during the year was 12,239 carats, valued at £9987, an increase of 244 carats, but a decrease of £1339 in value, as compared with the output of 1902. The bulk of the yield is still drawn from the deposits in the Tingha division, but the output from the principal mines on the Boggy Camp field evidenced a falling off.—The estimated value of the production of gem opal in the White Cliffs division was £100,000, as compared with £140,000 for the previous year. The known opal-bearing area had been worked and reworked, and the decrease in the production was due to the partial depletion of the deposits already opened.

For month of June, the gold output of New South Wales is reported at 28,508 ounces valued at £95,205, as against 34,622 ounces, value £129,859, in June, 1903. Yield for first six months of 1904 was 169,047 ounces, against 119,718 ounces for same period of 1903.

#### South Australia.

The Northern Territories M. & S. Co. reports, via Adelaide, for month of June as follows: At the smelting works, the water jacket smelter worked twenty-eight and one-half days, averaging sixty-two tons daily, and 1770 tons were treated, the average assay value before treatment being: Copper 4%, gold 4 dwts. 9 grs., silver 11 ounces per ton, production being 236 tons of matte, containing, copper 70 tons, gold 387 ounces, silver 19,500 ounces, valued at £7576. The tonnage treated consists of 1180 tons of ore and 590 tons of slag, the value of the ore being £6 5s per ton.—At the Mount Ellison mine, the main shaft was sunk 20 feet; timber fixed to 100 feet; now putting in 12-inch pump. Raised during month 300 tons carbonate ore, estimated value 7% copper.—At the Iron Blow mine the main shaft was sunk 23 feet, total 133 feet, on 100-foot level; south drive extended 22 feet, total 91 feet, assay value copper, gold, and silver, £6 5s per ton. Raised 1500 tons of ore.—Tramways: Mount Ellison section: Earthworks completed for 8 miles 6 furlongs; the rails are laid for 8 miles 6 furlongs; ballasting completed for 7 miles 6 furlongs. The large proportion of slags used at present is said to be necessary on account of there being a considerable percentage of finely divided carbonate ores. A briquetting machine will be put in and is expected to be working at the mines by Oct. 1st. The finely divided ore will be made into briquettes, and slags will not then be required for smelting. When the fine ore is supplied to the water-jacket smelter as briquettes, the tonnage of ore smelted will be increased by nearly 50%.

#### Queensland.

Brisbane reports show the Queensland gold output for month of June as follows:

	Tons Crushed.	Yield in Ounces.
Charters Towers.	21,300	21,300
Croydon.	6,000	3,600
Geelong.	17,500	9,800
Mount Morgan.	21,300	10,000
Ravenswood.	2,600	2,900
Other Fields.	4,500	2,400
Alluvial.		1,200
Total yield.		50,700

The total yield for the first six months of the year was 310,200 ounces.

The New Chillagoe R. & M. Co. at Chillagoe reports for period ending June 30 the smelting plant treated: For Chillagoe Co., 1228 tons copper ore; Mungana Co., 713 tons copper ore and 655 tons lead ore; purchased ore, 93 tons copper ore and 403 tons lead ore; Mount Garnet, 671 tons copper ore and 154 tons lead ore; total, 2705 tons copper ore and 1212 tons lead ore; producing 115 tons copper matte and 261 tons lead bullion, containing 86 tons copper, 261 tons lead and 47,452 ounces silver in the following proportions: Chillagoe Co., 43 tons copper and 3878 ounces silver; Mungana Co., 2 tons copper, 154 tons lead and 26,806 ounces silver; purchased ore, 7 tons copper, 91 tons lead and 6386 ounces silver; Mount Garnet, 19 tons copper, 16 tons lead and 7274 ounces silver; total, 71 tons copper, 261 tons lead and 44,344 ounces silver. Balance of product apportioned to matte retreated; copper and lead furnaces ran twenty-two and twenty-five days respectively. June railway receipts were £4105, with working expenses.

## BRITISH COLUMBIA.

The statistics of the approximate mineral production of British Columbia for the first six months of the present year, compiled by the Minister of Mines, includes the figures given below. The production of the last six months of this year will exceed the first six months, on account of the amalgamation of large concerns in the Boundary district and the installation of several concentrating plants in Rossland. The total production from January 1 to June 30, 1904, was: Gold, 123,339 ounces; silver, 2,037,061 ounces; copper, 17,513,886 pounds; lead, 16,500,000 pounds. The total production during the whole year of 1903 was: Gold, 232,831 ounces; silver, 2,996,201 ounces; copper, 34,359,921 pounds; lead, 18,089,283 pounds.

#### Boundary District.

J. P. Graves, manager of the Granby C. M. & S. P. Co., says the company has decided to spend about \$75,000 in equipping the No. 2 and the No. 3 tunnels at the Granby mines at Phoenix, which are reached by the Great Northern tracks. He will put an ore crusher, with capacity of 1000 tons every ten hours, at each tunnel, which will treble present crusher capacity at the mines. The ability of the mine to produce ore is now greater than the capacity of the smelter to reduce it. While it has been settled to increase the size of the smelter by doubling the number of furnaces, Manager Graves says it is hardly likely that they will make that improvement this year.

The Granby M. S. & P. Co. mines at Phoenix have shipped over 300,000 tons of ore so far this year, an average of about 8500 tons per week. Total for Boundary district for the year to July 15 was \$31,673 tons. The Granby smelter treated a total of 322,621 tons.

#### East Kootenay District.

After a shutdown of eleven weeks the coke ovens at Morrissey have recommenced burning. Sixty ovens are in operation. Six weeks ago the mines started after a close down which lasted five weeks, but the coal has been shipped out for steaming purposes. It is expected that by Sept. 1st the entire 240 will be fired, and the output of 500 tons a day will be reached. The coke weight is between 60% and 70% of the weight of coal put in the ovens, hence the mins will have to turn out 700 tons of coal to supply the ovens, which is double the quantity they now ship out. About eighty men will be required to handle the ovens.

The Gold River M. & P. Co. intends to put in hydraulic pipe, sluices and monitors and a sawmill with 20,000 feet capacity a day on its mine on Bull river, near Fort Steele.

#### Nelson District.

Near Ymir, the \$60,000 option on the Bayonne group of mineral claims will be taken up by H. B. Winchell, G. T. Magee, A. Janczewsky, C. F. Booth et al., of Butte, Mont., who will put in machinery for development.

#### Rossland District.

Machine drills have been put in at the Jumbo mine at Rossland. The compressor plant is running and air is used in the forge blowers. The development in the intermediate level is to be driven ahead with the machine drills. The mine is shipping fifty tons of ore daily.

A year ago concentration was a thing of the future in Rossland so far as concrete facts were concerned, says the Rossland Miner, but in the intervening twelve-month equipment for handling the milling ores of the camp has reached the following status: Le Roi No. 2—Fifty-ton plant in continuous operation and officially reported to be earning profits; cost, \$40,000. Velvet mine—Fifty-ton plant in partial operation; balance to be running by this week; estimated cost, \$15,000. War Eagle—Center Star mines—Two-hundred-ton plant partly running; entire works to be operating by August 1; estimated total cost, \$250,000. White Bear Con.—Seventy-ton plant partly built and progressing; may be in operation before September 1; estimated cost, \$30,000. Le Roi—Twenty-ton experimental works running continuously; construction of large works probable sequel to completion of milling details.

J. H. Mackenzie and F. W. Bradley, consulting engineers for the Le Roi mine, have recommended to the directors of the Le Roi M. Co. the erection of a 250-ton concentrator at the mine at Rossland.

#### Slocan District.

At the Monitor mine, at Three Forks, Manager M. Gintzburger will put in an air compressor and ore crusher. The concentrator will be built at Rosebery and run in conjunction with the zinc enriching plant under way there.

A company has been formed to take over the Molly Gibson mine, on Kokanee creek, 5 miles from Mollie Gibson landing,

to be known as the Aspen M. Co. The company is composed of Sherbrooke, Quebec, and Nelson, B. C., men. S. Jencks, of Sherbrooke, is manager. Nothing has been done at the mine since the slide of two years ago.

#### Vancouver Island.

G. H. Robinson of Salt Lake City, Utah, manager of the Britannia C. Co., operating on Howe sound, near Vancouver, says arrangements are being made for a tramway  $3\frac{1}{2}$  miles long and for a mill over the tables of which 600 tons of copper-bearing sulphides will pass daily. The breaking of ground for the plant will start this week.

## CANADA.

#### Alberta.

H. C. Galer, recently of Grand Forks, B. C., vice-president and manager of the International Coal & Coke Co., at Coleman, says although coal mining operations were started less than nine months ago the underground workings already exceed 1 mile in length, and a daily output of 250 tons is maintained in development. An extensive plant is being installed.

#### Quebec.

The Department of Lands, Mines and Fisheries' report of mining operations in Province of Quebec for year 1903 contains the following summary:

Kind of minerals.	Quantities Shipped or Used.	Gross Value.
(Tons of 2,000 lbs.)		
Titanic iron ore.	112	\$300
Bog iron ore.	12,035	34,985
Chromic iron.	3,020	45,300
Copper ore.	26,481	109,875
Asbestos.	26,481	916,970
Mica (thumb trimmed).	145	74,119
Ocher calcined.	1,748	20,440
Gold (ounces).	5,510	1,600
Slates (squares).	5,510	22,040
Cement (barrels).	40,000	66,000
Granite.		140,000
Lime (bushels).	1,000,000	140,000

Other non-metallic products bring the total values to \$2,772,782.

The total number of workmen employed was 4662 and their wages amounted to \$1,308,925.

## INDIA.

The Indian mines' gold output for the first six months of 1904, as compared with 1903, is reported as follows:

	1904.	1903.
	Ozs.	Ozs.
January.	51,588	48,080
February.	50,151	46,288
March.	51,034	48,327

The report of the principal producers of the Kolar field for June was: Champion Reef—Mill, tons, 15,120; ounces, 15,208; tailings (cyanide), tons, 20,176; ounces, 2770; total ounces, 17,978.—Mysore—Mill, tons, 1550; ounces, 15,219; tailings (cyanide), tons, 11,882; ounces, 1570; total ounces, 17,035.—Ooregum—Mill, tons, 10,894; ounces, 5209; tailings (cyanide), tons, 10,305; ounces, 1008; total ounces, 6217.—Nundydoo—Mill, tons, 6550; ounces, 5095; tailings (cyanide), tons, 5018; ounces, 551; total ounces, 5646.—Balaghat—Mill, tons, 2950; ounces, 2336; tailings, tons, 238; ounces, 225; total ounces, 2561.—Mysore West and Mysore—Wynad—Mill, tons, 1759; total ounces, 1022.

## MEXICO.

#### Chihuahua.

It is stated the Cia. Metalurgica de Torreon, owner of the smelter at Torreon, has plans prepared by Manager J. W. Pender for a concentrating plant for its San Diego mine at Santa Barbara and the mill will be built this year. Development work is blocking out ore.

La Doris gold mine, 85 miles northwest of Parral and 50 miles southwest of Batopilas, owned by J. F. Bode et al., of Parral, is being developed under superintendence of D. E. Owen. About eighty men are employed, and the mine is equipped with a 100-ton Huntington mill. The vein is 35 feet wide and is said to run \$10 per ton in free milling gold. Manager Bode proposes to put in improvements for increase of the output.

P. H. Heffron, who with J. W. Piper is working the Dos de Abril mine, near the Dolores mine at Dolores, west of Minaca, says the ores of the mine carry gold and silver and are in a limestone formation. They are sinking an inclined shaft which is down 70 feet, and they expect to strike the vein at 100 feet. They have a small mill. Heffron says the Heffron company is preparing a site for its mill, which it expects to have in operation by October 1. About 300 men are at work at the mine.

J. W. Pender of Parral, who controls the Socorro mine near Sahuayacan, in the western part of the State, and in the Jesus Maria district, expects to start

work on the property this week. J. A. Dick is in charge of the mine.

J. F. Johnson, B. Peterson et al., constituting the Descubridora M. & Dev. Co., are shipping 1000 tons of ore per month from the Descubridora mine, near the Adela mine at Santa Barbara. The ore carries silver and gold.—El Rayo M. & Dev. Co., composed of the same men, is developing El Rayo mine adjoining, and ore is being taken out, but none is being shipped as yet. H. L. Brown is manager. A mill will be built.

F. Howard and E. M. Parish are starting increased work on the Monte Cristo mine in Parral camp. They are to start a shaft and put on an electric hoist. They have done considerable work on the San Nicolas mine of the Monte Cristo group. The properties are on the veins that accompany a dyke, 2000 feet north of the Palmillo mine.

#### Coahuila.

The production of the coal mines in State of Coahuila is increasing, the output being approximately 1,000,000 tons of coal and 100,000 tons of coke a year, says the Mexican Investor. The Mexican Coal & Coke Co., working Las Esperanzas property, is producing 400,000 metric tons of coal and 75,000 tons of coke per annum. The shipping point is Barroteran on the Mexican International Railway. The company is building its own railway to the International, which will be 30 miles distant from an additional coal property bought in Muzquiz district. The Coahuila Coal Co. is working its properties at Hondo, 16 miles from Sabinas on the International Railway, and at Mezquite, 1/2 mile from Sabinas. It is producing 250,000 tons of coal and 20,000 tons of coke per annum. The company has begun to open a new part of its holdings known as the "upper coal field." The Fuente Coal Co., working its lands at Fuente on the Mexican International Railway, is producing 160,000 tons of coal per year. It has increased its holdings. The Monterrey Iron & Steel Co. is working its coal lands at San Felipe, 12 miles from Sabinas on the International Railway, and producing 150,000 tons of coal per annum. It has made arrangements for building 30 miles of track from Mezquite to Menor, the center of an additional tract of coal which it has bought.

A 34-foot bed of coal is reported found on the San Blas hacienda and another vein on the adjoining hacienda at Sanceda. They are near Monclova and development is under the Coahuila C. & O. Dev. Co.

The Fuente Coal Co. at Fuente, the Mexican C. & C. Co. at Esperanzas, the Coahuila Coal Co. at Hondo and the Mexican Iron & Steel Co. at Felipe are all increasing their holdings and operations will be extended. Further equipment will be required.

#### Guerrero.

(Special Correspondence).—In La Union district work will be started on the iron claims at La Mira, near the mouth of the Rio Balsas. Considerable ore is blocked out.—Nearly 2000 mining pertenencias of iron deposits have been denounced in the district recently.

La Union, July 20.

It is expected that a 60 or 100-stamp mill will be built at the Mina Grande property, near San Nicolas del Oro, says Superintendent W. W. Miller. The Mina Grande is owned by the Balsas Valley M. Co., which is operating it, having bought it for \$100,000 gold. Of this amount half has been paid. About 150 men have been steadily doing development work.

#### Jalisco.

M. G. Perez, of Guadalajara, who holds title to the Estrella del Sur y Anexas mines in southern Jalisco, says arrangements are being made to form a company in Chicago, Ill., to work them. Machinery will be put in. These mines were worked by the Spaniards and were producers of native silver. Two of the mines are flooded, and will be unwatered. There is a good wagon road from the mines to Zapotiltic, a station on the Zapotlan branch of the Mexican Central railroad.

Superintendent Fitzgerald of the Lupita mine, west of Ameca, says five stamps will be added to the mill.

The iron mines, mills and foundry at Ferreria de Tula have been leased to R. H. Beach of New York and G. Townsend of Indianapolis, Ind., who will increase the capacity to fifty tons daily and also build a steel plant. J. E. Jones of Pittsburgh, Pa., is manager.

A 50-ton concentrating plant has been placed in operation at the Soquito Prietas mines, south of Ayutla, says the Jalisco Times. These mines are owned by an American company and W. H. Lees is manager. The ore is low-grade copper.

A concentrating plant will be built by the Bautista M. Co., operating three old Spanish silver mines, near Ayutla. The company is of Boston, Mass., men and the

mines are managed by B. McLellan.

The Fortuna M. Co. has started its mill at the Candelaria mines, near Etzatlan. The mill and mines are under Manager R. Eames.—The mill of the Pozos M. Co. will be started about August 1, under management of S. S. Gates. The Pozos mine is owned by C. Kratz and C. E. Carroll.—J. J. Mann, of Philadelphia, Pa., has bought a half interest in the San Pablo group of mines, two hours' ride south of Etzatlan. There are five mines in the group, and they are old Spanish properties. Mann & Mathews are operating them with forty men. They have opened up 1500 feet of tunnels and stopes. The properties are between the Altamira group and the Santo Domingo mine.—The Camichi M. Co. has put in a larger hoist.—The Amparo M. Co. is shipping forty cars of ore per month, which is said to net \$1500 a car.

#### Lower California.

The Mendoza C. M. Co. is shipping high-grade ore from its mines at La Paz, direct to San Francisco, Cal. In June 125 tons were shipped, besides the free gold extracted on the plates, and the shipments for July aggregated 300 tons.

#### Michoacan.

(Special Correspondence).—In Arrio district, the Carrizal G. M. Co., owning 700 acres of mining ground at Agua Fria, has 125 men at work. The 5-stamp mill is crushing twelve to fifteen tons of ore daily averaging about \$16. The ore is a soft, blocky quartz and is easily milled. The ledge outcrops between layers of porphyry and slate lying on the granite. Over 500 feet of work have been done on the main incline—the Fortuna and the Bella Vista. Recently, while crosscutting, the Fortuna No. 6 old workings were cut into. Among the improvements contemplated by the company are a cyanide plant and the addition of a grinding mill, which is en route to the mines from Patzcuaro, on the Mexican National Railway. A tramway is to be built from the mine to the mill, a distance of 800 meters, reducing the transportation costs from about \$1 to an estimated 4 cents per ton. S. Butler is president of the company, E. B. Sanderson manager and W. J. Kelly chemist.

J. Luna has denounced ten pertenencias of mining ground south of Los Posos. The claim is a free-milling gold proposition.—Over 5,000,000 francs have been expended on the Inguaran copper mines, mostly in mine exploitation. A smelting plant is being built near the Rio Balsas. The mines are owned by a French company, in which the Rothschilds of Paris hold controlling interest.

In Apatsingan district work has been suspended on the San Juan and Virgen mines near Aguillita. They are copper-silver claims.—Work is progressing on the Alacranes mine and shipping ore is being produced. It is a silver claim and is owned by Aguillita parties.

#### Sonora.

La Brisca G. M. Co. has been organized to exploit placer ground adjoining the Greene Gold Co.'s property, 50 miles from Magdalena, by P. J. Debaney, J. A. Campbell, T. Evans, J. M. Walsh, P. R. Lucas, F. A. Mosher and G. W. Arnett, all of Cananea.

It is reported the Yaqui C. Co. is to put in at its mines at Campo Santo Nino a 100 H. P. hydraulic plant to operate the projected 2000-ton smelter, drills, etc. The source of power is the Yaqui river. W. E. Pomeroy is superintendent.

At Sahuaripa the Cienegueta C. Co., G. Beebe of Chicago, Ill., president, is preparing to put in two copper furnaces of 100 tons daily capacity for smelting its ore.

Two leagues below Sibachicori is the smelter of the San Juan mines—a water jacket, with a daily capacity of seven tons. The San Juan mines include 6 denunciations and 100 pertenencias, owned by J. Sattory, manager, and C. Laux, F. H. Seymour of Torres, A. G. Pace and C. M. Hughes of La Colorado. A ledge 16 feet in width runs the length of the properties and in places open cuts and other antigua workings show extensive development has been done. The properties are under bond to E. S. Rutherford of Nogales, Ariz., who is planning to increase operations. The present owners have sunk a shaft 130 feet deep on the ledge, developing a 4-foot body of ore carrying copper, gold and silver.

#### Zacatecas.

E. Gmelin has an option on the America mines, adjoining the Mala Noche mines, near Zacatecas, and says he is arranging to commence operations. It is expected that by Sept. 1 he will start work opening up the mines and installation of machinery.

J. F. McNabb, of the English company organized to take over the gold mines at Mesquit del Oro, says M. Cockerell,

manager, is starting operation of the Mesquit properties. The work of remodelling the 50-stamp mill at the mines is progressing, and the plant will be put in condition to treat 100 tons of ore daily.

At La Noria and San Bartolo, 12 miles from Sombrerete, B. C. Wheeler, who has a lease and bond, is preparing to build a cyanide plant.

#### NICARAGUA.

D. P. Gillis, formerly of Libby, Mont., now general foreman for La Leonessa M. Co. of Massachusetts, says the company has a property in Metagalpa department, near Metagalpa, which had been abandoned since 1881. A stamp mill has been put up, together with a cyanide plant, and mining will start this month. The mill will start with thirty stamps, though the company intends to make it a 160-stamp mill. The mine is working 350 men. The ore bodies are large and so situated that mining as a rule is carried on by quarrying. At La Leonessa they have a lead varying from 6 to 10 feet wide, with values running \$20 in gold per ton. The whole ledge, 60 feet wide, will average \$7 per ton, says Gillis.

#### TASMANIA.

The report of the Mount Lyell M. & R. Co., Ltd., operating copper mines at Mount Lyell, for the period ending March 31, 1904, shows the following table:

Copper sales.....	\$346,369
Railroad earnings.....	19,183
Total.....	\$365,552
Expenses.....	
Mining charges.....	\$ 47,867
Removing overburden.....	13,966
Smelting and converting.....	117,452
Freight and charges on copper.....	20,636
Railway expenses.....	13,577
General expenses.....	18,261
Mine prospecting.....	13,843
Total.....	\$251,602

The present company is a consolidation of the former Mount Lyell M. & R. Co., Ltd., and the North Mount Lyell C. Co., Ltd., and was incorporated in August, 1903, hence the report covers about eight months. The ore from the North Mount Lyell is smelted at the company's reduction works at Queenstown, and all supplies for the mines are transported by the Mount Lyell Railway, owned by the company. During the period 186,214 tons of ore were produced from the Mount Lyell mine and 54,846 tons from the North Mount Lyell, together with ten tons of copper precipitates from the mine water; also, from the Royal and South Tharsis mines 5182 tons of fluxing ore. The North Mount Lyell ore is now supplying silica, so that it is becoming unnecessary to operate the Royal and South Tharsis mines for flux. The North Mount Lyell main shaft has been sunk below the 200-foot level. During the eight months 5005 tons of blister copper resulted from the smelting operations, containing 4944 tons of copper, 510,906 ounces of silver and 13,139 ounces of gold. The smelting and operating costs have been decreased—due primarily, says the report, "to the elimination of the use of barren siliceous fluxes, owing to the complementary fluxing nature of the ores from the two principal mines." Coke is obtained from the company's coke works at Port Kembla, N. S. W.

#### Personal.

W. P. DUNHAM of Los Angeles, Cal., is in Denver, Colo.

E. H. MEAD is at Mountain City, Nev., from Salt Lake City, Utah.

J. JOSEPH has returned to Tonopah, Nev., from San Francisco, Cal.

J. E. JONES, a mine owner of Tonopah, Nev., is in San Francisco, Cal.

T. KEOGH returned to Salt Lake City, Utah, last week, from the East.

W. A. TICE of Tonopah, Nev., is in San Francisco, Cal., on mining business.

H. A. BUTLER, interested in mines at Nome, Alaska, is in San Francisco, Cal.

D. RAUSTRON is superintendent of the Parlette gilsonite mines, near Price, Utah.

W. F. BRAY of Placerville, Cal., is in San Francisco, Cal., on mining business.

W. F. SNYDER of the Western Exp. Co. is in New York, from Salt Lake City, Utah.

W. A. BRADLEY is manager of the Gold Hunter M. & S. Co. at Wallace, Idaho.

H. CATROW, manager of the Ohio C. Co.'s mill and mines at Bingham, Utah, is in the East.

L. J. GAGE of Chicago, Ill., is in Colo-

rado looking after mining interests, near Ward, Colo.

W. MAGUIRE, a mine manager of Dutch Flat, Placer county, Cal., is in San Francisco, Cal.

G. W. MYERS has returned to San Francisco, Cal., from a trip to southern California mines.

A. F. ARMSTRONG of the Newhouse M. Co., is in southern California from Salt Lake City, Utah.

M. E. DITTMAR, interested in northern California mines, is in San Francisco, Cal., from Redding, Cal.

A. H. CARPENTER is superintendent of the smelter of the Independent S. & R. Co. at Golden, Colo.

FRANK MANNING is en route to Mia Bong, Korea, to accept a position with the Oriental Con. M. Co.

R. C. CALHOUN, a mine manager of Topolobampo, Sinaloa, Mexico, has gone north on mining business.

H. J. KINKEAD of Virginia City, Nev., has gone to Mexico to put up a milling plant at Pachuca, Mexico.

H. JOSEPH of Salt Lake City, Utah, is at Caribou, Idaho, making an examination of mining properties.

E. W. MASSEY, interested in Sonora, Mex., mines, is in San Francisco, Cal., from Zubiate, Sonora, Mex.

J. J. MCSORLEY, a mine owner of Calaveras county, Cal., is in San Francisco, Cal., from San Andreas, Cal.

G. M. CLARK, superintendent of the River Hill M. & M. Co., near Placerville, Cal., is in San Francisco, Cal.

J. MCCHRYSTAL, superintendent of the Gemini mine of Eureka, Tintic district, Utah, is visiting in California.

W. F. DETERT, superintendent of the Zella mine at Jackson, Cal., has returned there from San Francisco, Cal.

J. F. BODE, a mine owner of Parral, Chihuahua, Mex., has gone to St. Louis, Mo., and other Eastern points.

G. W. ROOT, manager of the New York-Grass Valley Con. M. Co. at Grass Valley, is in San Francisco, Cal.

SAMUEL C. WIEL of San Francisco, Cal., has gone to Tonopah, Nev., to engage in the practice of mining law.

PRESIDENT J. E. BAMBERGER of the Daly-West M. Co. returned to Salt Lake City, Utah, last week from the East.

J. W. PENDER, manager of several mines near Parral, Chihuahua, Mex., has returned there from an Eastern trip.

P. H. HEFFRON, part owner of the Dos de Abril mine, near Dolores, west of Minaca, Chihuahua, Mex., is in the East.

H. H. YARD, representing the Western Pacific R. R., has returned to San Francisco, Cal., from Salt Lake City, Utah.

J. H. LENOIR has resigned as superintendent of the Senorita mine at Victorino, Chihuahua, Mex., and is in Chihuahua.

MANAGER ARKILLS of the Star tunnel at Idaho Springs, Colo., has returned to Idaho Springs from Lake Geneva, Wis.

PRESIDENT S. BAMBERGER is at the Bamberger gold mines and mill at De Lamar, Nev., from Salt Lake City, Utah.

F. BRADSHAW, manager of the Santo Domingo M. Co., at Batopilas, Chihuahua, Mex., has returned from an Eastern trip.

B. HOLDEN, managing director of the United States M. Co., has returned to Salt Lake City, Utah, from an Eastern trip.

R. J. COLEMAN of western Sinaloa, Mex., was in Denver, Colo., last week en route to New York, N. Y., and Boston, Mass.

J. E. JONES of Pittsburg, Pa., has been appointed manager of the iron mines, mills and reduction works at Ferreria de Tula, Jalisco, Mexico.

P. A. H. FRANKLIN, a Utah mine owner, returned last week to Salt Lake City, Utah, from examining mines in Colorado.

J. W. BURTON of the Pioche, Nevada, Con. M. Co., is at the company's mines at Pioche, Nevada, from Salt Lake City, Utah.

M. COCKERELL, recently at Guanaquato, Mexico, is manager of the gold mines at Mesquit del Oro, Zacatecas, Mexico.

M. A. BETTMAN of New York City, N. Y., is president and manager of the Independent S. & R. Co., operating the smelter at Golden, Colo.

SUPERINTENDENT VEITCH, of the

Arizona C. Co., who has been at Santa Barbara, Cal., for several weeks, has returned to the mines at Clifton, Ariz.

S. L. PEARCE, president of the La Luz G. M. Co., at Maguarichic, Chihuahua, Mex., is at the company's mines from Louisville, Ky.

F. L. RANSOME of the United States Geological Survey, is at Wardner, Idaho, to make a survey of the Cœur d'Alene mining district.

C. D. GETTIS, recently from Colorado, is superintendent of the Blue Ledge copper mines in Siskiyou county, Cal., south of Jacksonville, Or.

C. C. CLINE returned to Oroville, Cal., last week, after a year's absence in the Gold Coast, Africa, where he built a number of gold dredging boats.

J. W. MCCLURE of Des Moines, Iowa, president of the Queen of the Hills G. M. Co., has returned from the company's mines in the Black Hills, South Dakota.

H. I. WILLEY has returned to New York City, N. Y., from the mines of the Yaqui C. Co., near Campo Santo Nino, Sonora, Mexico, of which he is consulting engineer.

H. N. GALER, having resigned as assistant manager of the Granby Con. M. & S. Co. at Grand Forks, B. C., has gone to Coleman, Alberta, as vice-president and manager of the International Coal & Coke Co.

WM. H. ARMSTRONG, formerly manager of the New York business for the Chicago Pneumatic Tool Co., is now associated with the Ingersoll-Sergeant Drill Co. of 26 Cortlandt street, New York, and will look after the interests of the Pneumatic tool department.

PROFESSOR A. VANDER NAILLEN, who has for over thirty years conducted a school of practical mining engineering in San Francisco, Cal., has been appointed by the Belgium world's fair directors a commissioner to represent California at Liege, Belgium, from April to November, 1905.

## Obituary.

J. LANKAN, a pioneer miner of Montana, died at Anaconda, Mont., July 23rd. Deceased was 73 years of age and went to Montana in the early '60s.

H. C. ASH, a Black Hills, South Dakota, mining man, died July 25th at Lyons, Colo., at the age of 45 years. Deceased went to the Yukon region in the early days of the Klondike excitement and was successful in mining there.

W. H. PETTIT, an Idaho mine owner and manager, died in Boise on the 19th ult., in his eighty-first year. Deceased was interested in the Valley View mine, near Idaho City, Idaho, and in other properties there in the early days. He went to Idaho about 1876, as manager of the Monarch mine at Atlanta.

G. B. MCAULEY of Spokane, Wash., identified with British Columbia mines, died at Callamisk, Scotland, on the 20th ult. Deceased was born in Scotland. He went to Spokane, Wash., from Silver City, N. M., and joined the rush to the Cœur d'Alenes during the first excitement over the discovery of the Bunker Hill and Sullivan mines, and was associated with V. B. DeLashmutt in the Stewindler, California, Granite and Sierra Nevada mines. Later he went to British Columbia and became interested in the Cariboo mine, near Camp McKinney. He was also interested in mines at Rossland.

## Trade Treatises.

"The Perfection Dust Collector" is the subject of discussion in a handsome trade treatise for the makers and vendors, the Prinz & Rau Manufacturing Co., Milwaukee, Wis.

"Jeffrey 'Century' Rubber Belt Conveyors" is the subject of the latest trade treatise from the Jeffrey Mfg. Co., Columbus, Ohio, and gives illustrated information in detail regarding this important branch of transmission machinery. The booklet will be sent on request.

Catalogue No. 42, from the F. M. Davis Iron Works Co., Denver, Colo., is devoted entirely to the filter press treatment of gold ore slimes, and the leaching of copper ores. These important subjects are discussed in technical detail, making the pamphlet of more than ordinary value. It will be sent to any address on request.

## Commercial Paragraphs.

THE Rapid-Economy Stamp mill Co. of San Francisco, Cal., is erecting one of its 3-stamp mills on the Longfellow mine, in Tuolumne county, Cal., which will be in operation in about ten days. They will also have one of their 3-stamp mills dropping at the F. & W. mine, near Angels, Cal., soon.

THE John T. Baker Chemical Co. has recently been incorporated for the purpose of manufacturing chemicals for assay and laboratory work. The company is now erecting a plant at Phillipsburg, N. J., which will probably be ready for occupancy by October 1. The officers are: John T. Baker, president, and Charles D. Davis, secretary and treasurer. The main business offices of the John T. Baker Chemical Co. will be located at Easton, Pa.

THE O'Rourke Engineering & Construction Co., which firm has the contract for building the Pennsylvania Railroad tunnel under the Hudson river, has placed the order with the Ingersoll-Sergeant Drill Co. for two central compressed air power plants to be located at New York City and Weehawken, N. J. This order includes eight 36-inch stroke Corliss air compressors, each of 3690 cubic feet capacity. With the O'Rourke plant installed, the total number of Ingersoll-Sergeant compressors supplying air for subaqueous tunnels in New York will be as follows: Six class "A" straight line compressors, twelve Corliss duplex compressors, three class "H" duplex compressors, two class "G" duplex compressors.

THE Excelsior Wooden Pipe Co., 6-8 California St., San Francisco, Cal., has a contract for furnishing and erecting wooden stave pipe for the municipal water supply of Lynchburg, Va. The pipe is to be about 20 miles in length, with an inside diameter of 30 inches. Heretofore wooden pipe construction has been largely confined to the Middle and Western States. The Excelsior Wooden Pipe Co. say this is the largest contract for this particular style of construction ever awarded near the eastern seaboard. The fact that a large cast-iron pipe foundry in Lynchburg made efforts to secure this contract without success shows that the value of wooden stave pipe is becoming thoroughly recognized in the East as well as in the West, and since the staves will be shipped from the west coast and furnished by Redwood Manufacturers Co., who act as agents for the above contractor, shows that the western lumbermen can compete in the eastern markets. The Excelsior Wooden Pipe Co. is also about to install a line of 60-inch diameter pipe for Cornell University at Ithaca, New York.

## Dividends.

Bunker Hill & Sullivan M. & C. Co., dividend No. 82, \$75,000; payable August 4. Total paid since January 1, 1904, \$438,000; total to date, \$1,971,000.

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING JULY 26, 1904.

765,657.—PNEUMATIC FEEDER—T. J. Amault, Everett, Wash.  
766,095.—MAIL BOX—J. A. Barclay, Ballena, Cal.  
765,914.—EYEGLASS SUPPORT—W. S. Boyd, 3rd, Los Angeles, Cal.  
765,813.—CAR FENDER—E. E. Caton, San Jose, Cal.  
765,888.—RAIL JOINT BRIDGE—C. W. Coburn, S. F.  
765,817.—SUPPORTING DEVICE—A. M. Cox, Los Angeles, Cal.  
765,023.—BOTTLE—D. W. Divine, Highlands, Cal.  
766,026.—APPAREL HANGER—Curtis Easton, S. F.  
766,034.—FLOW COLTER—J. B. Hamilton, Requa, Cal.  
765,777.—ROTARY MOTOR—J. F. Hathaway, S. F.  
765,894.—HAIR DRIER—S. Hudson, Los Angeles, Cal.  
765,049.—VIOLIN—J. D. Loppentien, Orange, Cal.  
765,784.—NAPKIN HOLDER—D. G. McClay, Santa Ana, Cal.  
765,851.—LAUNDRY TONGS—S. R. Nettleton, Kirkland, Wash.  
765,905.—LEGGING—M. Rose, S. F.  
765,797.—RAILWAY—A. J. Smithson, Portland, Or.  
765,800.—FAUCET CUTTER—F. Stansfield, Los Angeles, Cal.  
765,072.—GAME TABLE—N. B. Stone, Outlook, Wash.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

LEGGINGS—No. 765,905, July 26, 1904. Maxim Rose, San Francisco, Cal. This invention relates to improvements in leggings for the protection of the lower parts of the legs and trousers, and it consists of a flexible wholly or partially waterproof material adapted to wrap around the leg and having a stiffener at one edge and a bar near the other edge, with an upturned hook at the lower end of said bar adapted to engage the lower edge of the

fold of the trousers. A hook and elastic cord connect the edge of the leggings with the bar to hold the leggings in place.

PORTABLE RAIL JOINT BRIDGE.—No. 765,882, July 26, 1904. C. W. Coburn, San Francisco, Cal. This invention consists of a plate of metal adapted to rest upon the outer flanges of contiguous abutting rails and crossing the open space between said ends, the upper surface of said plate being substantially on a plane with the tops of the rails, and an elastic steel plate secured thereto and adapted to spring over the tops of the rails to retain the bridge plate in position and form a continuous surface for the passage of car wheels.

## Latest Market Reports.

SAN FRANCISCO, August 5, 1904.

### METALS.

SILVER.—Per oz., Troy: London, 27d (standard ounce, 925 fine); New York, bar silver, 58½c, refined (1000 fine); San Francisco, 58½c; Mexican dollars, 47½c San Francisco, 45½c New York.

COPPER.—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$12.75; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £56 15s 0d spot per ton.

LEAD.—New York, \$4.25; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 13s 9d long ton.

SPELTER.—New York, \$4.85; St. Louis, \$4.75; London, £22 2s 6d long ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$27.00@27.20; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, \$30, 32½c. London, £123 spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 17s 6d San Francisco, local, \$41.50@43.00 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.00@42.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 3½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure, \$3.50, 50c; dust, \$3.10, 10c; sulphate, \$3.10, .04c.

NICKEL.—New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

### STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.60 @12.85; gray forge, \$12.00; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c per lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

CEMENT.—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

### GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No.

1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.00; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brynbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$11.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$11.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c per lb.; carloads, 22@23½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, \$2.00@2.25; California refined, 1¼@2c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5½c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1¼@2c per lb.; nitric acid, carboys, 8c per lb.

OILS.—Lined, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Ecocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

BONE ASH.—Extra No. 1, 5@6c per lb. No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c per lb.

BORAX.—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MOLYBDENUM.—Best, \$2.00 per lb.

CHROMIUM.—90% and over, per lb., 80c.

PHOSPHORUS.—American, per lb., 70c.

SILVER.—Chloride, per oz., 90c@1.00; nitrate, 55c.

MERCURY.—Bichloride, per lb., 77c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—per lb., \$2.75.

SODIUM.—Metal, per lb., 50c.

BISMUTH.—Subnitrate, per lb., \$2.10.

URANIUM.—Oxide, per lb., \$3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## To Users of Gold Dredging Machinery.

The Risdon Iron & Locomotive Works of San Francisco, California, has instituted in the Circuit Court of the United States, for the Northern District of California, equity suit number 13,605, against the Western Engineering & Construction Company and the Central Gold Dredging Company, as joint infringers of certain patented Gold Dredging Machinery which is owned and controlled by The Risdon Iron & Locomotive Works.

The patented apparatus claimed to have been infringed is what is commonly known as the "Postlethwaite Rotary Separator Gold Dredge," which is the machine in general use on the Feather river and on the property adjacent Oroville, California.

Owing to the great success which has followed the use of this machine, the present suit will be watched with great interest by those interested in this class of gold mining.

## The Mines of Clifton District, Graham County, Arizona.

Among the most extensive mining and reduction plants of southeastern Arizona are those of the Arizona Copper Co., and of the Shannon Copper Co., near Clifton, in Graham county. The mines of the Arizona Copper Co. are located at Clifton, Metcalf, Coronado and Garfield, the works, with the exception of the concentrator at Longfellow, being at Clifton, an illustration of which appears herewith. Over 1500 tons of ore are treated daily by this company, the motive power being gas engines, the total equipment exceeding 2500 H. P. The company makes its own coke used in smelting the ores and concentrates, the gas resulting from the coke making being employed in running the engines. The most recent installation at these mines is an electric haulage plant. The Shannon Copper Co. has its mines at Metcalf and its works (see accompanying illustration) near Clifton. The ores and concentrates from this property are smelted in the company's furnaces at Clifton, being hauled over a narrow gauge railway. The Arizona Copper Co. and the Shannon Copper Co. have a side-line working agreement by which all extralateral rights are waived, by means of which all contentions and disputes are obviated, which, owing to the irregularity of these deposits, would undoubtedly otherwise be numerous. The underlying rocks of the district are granite, over which lies a series of sedimentary beds, chiefly limestones and quartzites, intruded by porphyry, which latter has an intimate association with the ore. These rocks are much disturbed by faulting and movement. The deposition of the ores has followed the extensive faulting and fracturing of the rocks. Faults showing a displacement of more than 1000 feet are of common occurrence. The ore deposits were evidently all formed since the intrusion of the porphyry. As an interesting result of contact metamorphism, the lower Carboniferous limestone, ordinarily in this district a pure calcium carbonate, has been transformed for a distance of several hundred feet into a mass of almost solid garnet rock. The shales are less metamorphosed, but usually contain more epidote near the porphyry. Magnetite, pyrite, chalcopryite, and zincblende accompany the contact metamorphic minerals, and appear to be the result of this form of metamorphism. In many places the ores have accumulated along certain horizons in the sedimentary rocks, which evidently were in some way more susceptible to the infiltration of mineral

The Shannon Copper Co.'s Concentrator and Shops, near Clifton, Ariz.

solutions and the deposition of ores from them. The ore bodies are usually very irregular in form and size, but are generally roughly tabular in shape, owing to the deposition of mineral along the bedding planes of the rocks. The deposits have been much altered by their oxidation and the removal of certain constituents which have in some instances been redeposited elsewhere. The sulphide ore chalcopryite has been converted into carbonates and oxides. Copper glance occurs very sparingly in the oxidized zone and other sulphides of copper are almost entirely absent. The zinc sulphide has been leached out as zinc sulphate, and this mineral is often found incrusting the walls of the tunnels. The oxide and carbonate copper ores have been extensively mined in this district, and these ores are now produced in much less amount than the chalcocite ores, which are at present the mainstay of the mines. This ore is generally conceded to be the result of secondary enrichment. Owing to oxidation by surface waters, copper (probably as sulphate) has been leached from the original ores and redeposited in the porphyry in the Shannon mine, where it is now found as chalcocite. A similar occurrence is observed in the Metcalf mine. Unlike some of the other copper districts of southeast Arizona, in this district are found fissure veins cutting granite, sedimentaries and porphyries alike. These

fissures form a distinct type of ore deposits in this district. As a rule the limonite outcrops show little or no copper, but veins in the porphyry usually carry copper oxides and carbonates at the surface. The main vein of the district is known as the Humboldt, on Copper mountain at Morenci. The croppings of this vein are almost destitute of copper, but at 200 feet from the surface payable ore is found, consisting of chalcocite (copper glance) and pyrite. The ore deposits of this class, impregnations of country rock, are not sharply defined, but fade away gradually by disappearance of the mineral. The principal ores of the district at present being worked are the chalcocite impregnations in country rock, and these require concentration. The Coronado mine occupies a fault fissure between granite and quartzite and is the anomaly of the district. The Copper King is found in a series of fissures at contact of granite and porphyry. The district thus has represented bedded deposits, fissure veins, contact veins and secondary impregnations.

THE decision of a judge of the Supreme Court of the State of New York that the eight-hour law is unconstitutional is likely to have a far-reaching effect and may extend to the West where several States have adopted and endeavored to enforce the eight-hour law.

## Common Sense Required.

One of the most serious mistakes made in mine operation is the effort to make a large property out of a small one. There are often found veins of large size in which occur a narrow paystreak—large enough, perhaps, to pay to keep five or ten stamps employed, but which will not supply sufficient ore for a larger mill. This fact is sometimes disregarded and a large mill is built on this really small mine and a failure is the usual result. In some instances the fault lies in the demands of the directors and stockholders, and at other times it may be charged to the management. A large low-grade ore body with rich streaks or spots in it is all right if the low-grade ore contains enough value to afford a profit, without the aid of the rich spots and streaks, but when the rich portions only pay it is bad business to mine the great mass of ore and mill the entire vein to obtain the values from the spots, if it can possibly be avoided. Occasionally this cannot safely be done, particularly where the rich spots are concentrated in small spaces, like gold pockets, which occur in some mines. In such cases it is found advisable at times to mill all the vein material, that none of the gold shall be inadvertently thrown into the filling or over the dump. There are instances, however, where the values occur in certain strata or in good-sized bunches, and these actually constitute all the pay rock in the mine, but in the desire to make a large showing a big mill is built, a great many more men are employed than necessary, and the property is operated on an extensive and extravagant scale. The result is never satisfactory unless the good ore is sufficiently rich to pay all the expenses of extravagant management. This condition is found in copper, silver, lead and zinc mines, as well as in those producing gold. A number of instances can be mentioned where this policy was pursued until the concerns were wrecked financially, to be subsequently reopened by others, who successfully worked the mines on a scale commensurate with their magnitude, and in a practical, common sense manner.

## Why Good Mines Are Closed.

It is not an unusual thing to see a mine with extensive development, large equipment, and a good record, lying idle. Not infrequently the property is offered on the market, the owner extolling its past history and grand possibilities, and still seemingly unwilling to work it himself. There are a great many different kinds of people engaged in mining—more, perhaps, than there are different kinds of mines—and these are legion. The fact that the owner of a mine speaks enthusiastically of his idle mine is not prima facie evidence that the property is without merit. Mines have periods in their history as varied as those in the life of an individual. As an instance may be mentioned a noted mine discovered by a prospector, who still owns it. In its early history this mine produced high-grade shipping ore. Extensive development was made and a large tonnage of ore exposed. The character of the ore changed in depth, and though shipping ore can still be sorted from the vein, it is no longer a producer in large quantities of the rich ore of its palmy days. The ore now exposed in the well developed mine aggregates many thousands of tons, and it is payable ore, too, but not for the owner of the property, who, though an expert miner, has no knowledge of metallurgy. As a result, the mine is being worked in a small though careful way, paying all the expenses of development and something over, and the tonnage of ore in sight daily grows larger. The metallurgical problem is not without solution in a manner oft proven to be successful elsewhere; but the owner of this property is not conversant with this fact, and continues his development work while "looking for something to turn up." Another instance may be cited where a large mine, which has produced a great amount of gold, to-day lies idle waiting for a buyer. It has a mill, the mine is open, but the owner apparently does not feel disposed to operate it. At first sight this looks strange, but a careful study of the situation reveals a reasonable excuse for this inactivity. In the prosperous period of its history the production of rich ore was accomplished as rapidly as possible, but development did not keep pace with this extraction of known ore bodies. The character of the ore changed also, sulphides to a great extent replacing the free oxidized ore. Moreover, the values decreased as the workings ran out of the pay shoots, until comparatively low-grade ore is found in almost every face. With the change in the value and character of the ore, the mill machinery and methods were not changed materially, and as a result as values went down the percentage loss in tailings went up. The property now needs capital for dead work and a mill suited to the changed condition of the ores. These things the owner is either unwilling or unable to supply and the mine is idle. These are merely two instances which typically illustrate the need of a full understanding of the problems of mining and metallurgy. Development must be carried forward contemporaneously with the extraction of the reserves or the life of the mine is limited to the removal of all the ore in sight. This may be a matter of several years or only a few months—the principle remains the same. So with the metallurgical branch. A change in the value or character of ore usually demands a more or less radical change in treatment. When a rich mine is being successfully operated, the management is too often disposed to neglect extensions of development—crosscutting, re-timbering and shaft sinking to explore lower levels—and sooner or later a good mine is closed. An instance comes to mind where a rich mine was operated to a depth really beyond the capacity of the hoisting and pumping machinery, which were maintained by frequent repairs. Finally the pump broke down completely and the owners refused a new plant because the lowest level looked less promising than those above. Had a new equipment been supplied at the proper time this mine, now idle, would probably still be in operation. In another instance a rich gold mine was operated without very necessary shaft repairs. The hanging-wall timbers slowly crowded downward until the skip was in imminent danger when the wall plates were trimmed with axes until the skip would pass safely. A few weeks later this was repeated,

and again, until it became evident that it would be unsafe to cut the shaft timbers further, so the skip was replaced by one of smaller size. The timbers, however, continued to close in and eventually the pump gave out and the mine was abandoned and remained idle for years. It was reopened by others and has since produced a large amount of gold and is still an active and profitable property. The several instances above cited are but a few of the numerous similar cases where good mines are closed through lack of foresight on the part of the owners or manager. Happily, a broader view of the situation is being taken of these matters to-day, and in the future it is likely that mine managers will be more inclined to profit by the unfortunate experience of others and not allow themselves to be caught in a similar predicament.

THE recently published reports of the high wages paid at the newly discovered beach mines at and near Sand Point, on the Alaska coast, are attracting many men to that latest gold field in the far north. The venture is sure to prove disappointing to the greater number who go, as those already there and living in Alaska have long since taken up all of the available claims, and the high rate of wages at first offered will quickly be reduced as the demand is supplied. Alaska is a great mineral country and its resources are only beginning to be known. Of those who go there properly equipped with means, great possibilities await them, but those who go with the view of securing work at abnormally high wages for unskilled labor are doomed to disappointment—at least, this has been the experience of the past in that country, and that the present instance will prove an exception there is no reason to anticipate.

THAT unpatented mining claims are property, in the strictest sense of the word, is a fact recognized by all mining lawyers and those informed on matters of this character; still there are those who think it wrong to tax property to which the claimants have not secured absolute title. To all intents and purposes the title of a claim owner to an unpatented claim is as good as though it were patented, so long as the requirements of the law are complied with. It is not an easy matter to dispossess a claim owner, even for cause, as so long as he shows his good faith by a strict compliance with the Federal, State and local laws his title to his claim is sufficient. The Supreme Court of California has recently rendered a decision emphasizing the fact that unpatented mineral claims are property, and as such are taxable.

THE copper mining industry shows no sign of advancing price for the metal. The production is large, though apparently normal. All the most important copper mines of the United States are in operation, and both British Columbia and Mexico are producing a large additional amount, but the consumption of copper seems to keep up with the heavy production. While higher prices have been looked for, the present price and condition are not unsatisfactory. The constant increase in electrical development calls for more and more copper, and this demand can only be met seemingly by the opening of new mines.

AN instance of short-sightedness in the management of a mine is seen in a Tuolumne county, Cal., mine, which has recently been bought and paid for from the proceeds of operating the mine, but where it has now been found necessary to hang up the mill because of shortage of ore. The necessary dead work must now be done which should have been accomplished during the productive period. It is a wise policy to keep the work of prospecting and development well in advance of extraction of ore bodies, and thus, as far as possible, avoid the unpleasantness and additional expense of a shutdown.

THE movement of large numbers of men from one district to another in Alaska is a feature of this season's operations in the far North. Recent advices from Dawson state that several thousand men and women have taken advantage of the open summer months to remove from Dawson and vicinity to the newer district of Tanana, and that the exodus has left the mines and industries about Dawson crippled for want of laborers and wages have gone up accordingly.

## CONCENTRATES.

If the distance over which it is desired to transmit power exceeds 60 feet, it would probably be more satisfactory to put in rope transmission than to attempt to employ belts.

**MOLYBDENITE** may be concentrated from its gangue minerals by the oil process, by magnetic separators and by the ordinary methods of concentration, though the last is stated to be the least satisfactory. The crushing should be done with rolls.

**PRESSURE BLOWERS** are seldom used for mine ventilation in metal mines, the fan type of ventilator being considered efficient, and less in first cost. There are places, however, where the fan is of no service and "direct blowers" are necessary.

When air compressors are arranged in pairs, it is a good idea to place valves on each of the pipe lines leading from each cylinder and between the cylinders and the point of union of the two pipes. This arrangement makes it possible to run one side of the machine in the event of the other becoming disabled.

It is unsatisfactory to undertake to secure high speed by belting direct from a very large to a very small pulley. It is advisable to interpose at least one intermediate pulley, as the belts will operate to better advantage in this way—reducing from a large to a medium-sized pulley and from the latter to the smallest pulley.

As a means of thawing frozen ground to be excavated it has been suggested that a series of boxes, similar to sluice boxes, be placed over the ground, end to end, cover the cracks with gunny sacks and close the ends, covering the sacks with earth, then turn steam in from a boiler. Ground may be thawed cheaply in this manner.

The best mill for soft sulphide ores and other minerals that slime readily, and which it is desired to concentrate, is one which will granulate the ore into fine particles with the minimum amount of attrition. The ore should not be crushed finer than necessary to free it from its matrix. Further crushing or grinding results in slimes.

Where an air pipe is buried to a depth of 3 feet underground, and where the snow falls to a depth of 3 feet in winter, it is unlikely that there will be much movement in the line due to changes of temperature; but, as a factor for safety, it is advisable to put in slip joints at points where there may be radical changes in the direction of the line, whether these changes be in a vertical or a horizontal direction, as it is at those points that the greatest movement, if any results, takes place.

In a large vein or ore deposit lying at a low angle, and where this fact makes it necessary to shovel a large amount of the ore, the levels should be run closer together, and the operation of the mine may be facilitated somewhat by putting in raises which stand steeply from level to level instead of following the foot wall. Where it is considered necessary to run levels a long distance apart—100 feet or more—it has been found that shaking troughs are a convenient method of passing ore from slopes to levels below.

The cost of earth work depends entirely upon the situation, the character of material to be removed and its condition, upon wages, and to no small extent upon the magnitude of the job, whether or not it may be best done by hand, or whether it will justify the use of horses and scrapers, or possibly steam shovels. As to materials which may be considered as earth, there are loam, sand, fine gravel, coarse gravel, shale, and materials containing a greater or less amount of clay. Whether the material to be moved is wet or dry or frozen is often of importance in handling materials. The cheapest method of handling earth is by hydraulic if the means be at hand, but this is not often the case.

The term cuproso cyanide may be more fully understood upon considering that the term potassium ferrocyanide is applied to the salt  $K_4FeCy_6$ , instead of calling it potassium ferrous cyanide, because it is looked upon as a compound of the positive radical or ion potassium, with the negative radical or ion ferrocyanogen ( $FeCy_6$ ), rather than as a compound of potassium cyanide with ferrous cyanide, in which case the formula might be written  $4KCy, FeCy_2$ . Similarly we have cobaltcyanides, ferricyanides, etc., and the words cuprocyanide, aurocyanide, auricyanide and argentocyanide are sometimes used for the salts formed when  $CuCy$ ,  $AuCy$ ,  $AuCy_3$  and  $AgCy$  combine with alkaline cyanides.

MOST of the litigation due to conflicts over extralateral right is the outcome of the carelessness of prospectors in locating their claims. The mining law on this subject is clear, but is often disregarded by locators either through ignorance of the law, for which there seems to be little excuse, or they intentionally neglect to mark boundaries before they can feel sure of the strike, dip and trend of ore shoots in their claims, thinking to benefit by such knowledge and to locate to greater ad-

vantage. Not infrequently this is done to the disadvantage of others, following which lawsuits are almost inevitable. In other cases the extraction of ore is a clear case of trespass, but this is seldom admitted by the trespasser, and the usual litigation is a consequence.

TOO HIGH a blast pressure in blast furnace work will have a tendency to drive the fire toward the top of the charge, and if the size of the furnace will admit it a reduced blast will be an aid to the matte charges in bringing the zone of fusion down. Copper furnaces require less blast than those working iron, and lead stacks require still less than copper. Peters says, "8 H. P. will drive a positive blower suitable for a 36-inch copper furnace, while a 48-inch stack will require from 12 to 14 H. P." On blowers it is advisable to make the pipe leading from the blower to the furnace of larger diameter than the outlet of the blower by at least 20%, and if the length of pipe be greater than 50 feet it should be from 30% to 50% larger. This precaution materially diminishes the friction of the air moving in the pipe and aids in the efficiency of the blast.

THERE is considerable difference of opinion among millmen as to the length of time a cleanup barrel should be run in a mill, and this divergent opinion probably represents the varied experience of different localities. One class of men say that 4 to 6 hours is long enough. Others insist that 36 to 40 hours is necessary. The first claim that long-continued running will flour the quick-silver. A third class take an intermediate position and say the barrel should be revolved 12 to 24 hours. It is probable that in this matter as in almost every other phase of gold milling each mill foreman will run his barrel the length of time that experience in a particular mill seems to justify. If the pulp be too thick, it will undoubtedly flour the mercury. Ordinarily from 6 to 24 hours will be found to be the outside limits of time a barrel should be run for satisfactory results.

IN the matter of right of way over the surface for mining purposes the right of a State to legislate on this subject is limited to the powers conferred by its constitution. The following States have enacted legislation prescribing methods of obtaining easements and rights of way for mining purposes and providing for condemnation proceedings: Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, North Dakota, South Dakota, Utah, Washington and Wyoming. In California the State Legislature has provided (Section 1238) that the right of eminent domain may be exercised as a public use for by-roads leading from public highways to mines. Accordingly subsequent locators of mining claims who surround an original locator on all sides cannot deny the latter the right of way for a road from his mine to the public highways of the neighborhood.

NITROGLYCERINE explodes from concussion and sometimes without apparent cause. The safest way to explode nitroglycerine, nitrocelatone and nitro powders, is by means of the exploders or caps made for this purpose, XXXX being recommended. The higher the percentage of nitroglycerine in the explosive, the more readily will it explode. If the powder has failed to explode, it is because the powder is too old or the caps are too low-grade XX or XXX, or possibly the powder may have been too cold. The experimentation with chemicals which are likely to cause explosion upon coming in contact with each other is a dangerous practice which novices should not attempt. Nitro powders are made of various grades, from 5% to 70%. When a stronger explosive than the latter is needed, nitroglycerine is usually employed. It is best to employ some one familiar with these materials to do the blasting or exploding, as all are dangerous in the hands of the inexperienced.

"DARTON'S TEST" for gold by the iodide method is a delicate one and is hardly adapted for use in the field. In prospecting the miner searches for outcrops of ore, and usually the gold in an ore from croppings may be seen by washing in a pan or hornspoon after fine crushing. Occasionally an ore is found in which the gold is too fine to be seen or it washes out by the movement of the water. Rocks which look like ores, but which fail to yield colors on panning, should be carefully marked and saved for assay. Fine gold may be dissolved in a weak solution (0.02%) of potassium cyanide, and the gold precipitated on a block of charcoal as a brownish-yellow film of infinitesimal thickness, but to be visible the ore must be rich in gold. Fresenius says, page 260, edition 1902: "Stannous chloride, containing an admixture of stannic chloride (which may be easily prepared by mixing a solution of stannous chloride with a little chlorine water), produces even in extremely dilute solutions of gold, a purple-red precipitate, or at least coloration, which sometimes inclines to violet or to brownish red. This precipitate, which has received the name of purple of cassius, is decomposed by hydrochloric acid, with the separation of gold."

BLISTER COPPER is a high-grade crude copper from which has been removed nearly all the impurities which may be removed by oxidation, slagging and volatilization. When it has been properly manipulated it contains from 97% to 99% copper. The proportion of sulphur is very small. Black copper is the crude copper resulting from running blast furnaces on oxide copper ores, or on roasted sulphide materials (matte). It is

always alloyed with one or more other metals. It usually contains lead and iron and sometimes sulphur. The bars on cooling assume a blackish color, hence the name. By "copper bottoms" is meant usually a product of indefinite composition, generally the result of smelting in reverberatory furnaces rich copper-bearing materials with insufficient sulphur present to form matte. This method of treating ore is based on the fact that metallic copper has a greater affinity for certain substances than copper matte has, and by this method these substances are caused to combine with a small amount of copper present, while the larger part of the copper forms a matte free from these substances. The substances may be arsenic, antimony, tin or lead, which are undesirable, or they may be gold or silver, which are much desired.

JAMES in his work, "Cyanide Practice," says, page 135: "Bromo-cyanide may be added in crystals. This form has proved inconvenient and expensive to transport owing to the liability to decomposition, or it may be made on the spot by the addition of dilute bromine water to a solution of cyanide, the latter being in excess. By cyanide is meant potassium or sodium cyanide. It is not advisable to add all of the bromo-cyanide at once, but in portions, say every two hours, as in the presence of cyanide solution decomposition is rapid, being completed in three to six hours. It is stated that in practice the crystals give lower cyanogen consumption than the home-made solution, but this statement does not appear to be verified. To test for bromo-cyanide, add potassium iodide and hydrochloric acid in excess; the liberated iodine is then titrated with  $\frac{N}{10}$  sodium hyposulphite in

the ordinary manner. In forming bromo-cyanide by the addition of bromine water to potassium cyanide solutions, it must be noted that the reaction  $KCy + 2Br = BrCy + KBr$  takes place slowly with dilute solutions and is not completed for some time. With stronger solutions, however—those over 1%—the reaction is immediate and even violent, heat is produced and decomposition products form."

NATURAL DEPOSITS of sulphur are sometimes found stratified with beds of clay or rock, but they often occur as what are known as "living beds," in which the sulphur is continuously being formed as the result of active chemical decomposition. In such a living sulphur bed the sulphur is produced by the direct action of sulphurous gases, especially hydrogen sulphide ( $H_2S$ ) and sulphur dioxide ( $SO_2$ ), which in the presence of moisture ( $H_2O$ ) react and form water ( $H_2O$ ) and sulphur ( $S$ ). These gases emanate in regions of active or expiring volcanoes, and form the so-called solfataras, in which the sulphur has been condensed from the vapors formed and has collected in cracks in the lava tufts or in the kaolin or clay formed by the corroding action of the acid vapors on the lavas. From a commercial standpoint, especially for the manufacture of sulphuric acid, the mineral from the solfataras deposits is not regarded favorably on account of its liability to contain arsenic in the form of the minerals orpiment ( $As_2S_3$ ) and realgar ( $AsS$ ). Sulphur of this character has been imported from the island of Volcano, one of the Lipari group, off the coast of Italy. A similar association of arsenic minerals has been reported in the sulphur deposits in Yellowstone Park. Traces of selenium and tellurium, which are also objectionable in the manufacture of sulphuric acid, occur in the volcanic sulphur deposits in Japan. The only solfataras deposits of commercial importance at the present time are in southern Utah and in the island of Hokkaido, Japan. Solfataras also occur in numerous places in California, notably in Sonoma and Lassen counties, but nothing is being done with them.

CRUSHING ROLLS may be run at too high a speed to accomplish the best results. Ore falling from the hopper feed between the rolls drops from 12 to 24 inches, having a final velocity of 480 to 680 feet per minute, according to height of drop. If the periphery speed of the rolls too greatly exceeds the velocity of the piece of ore at the time it first reaches the angle of "nip," it will slip. The character of the ore must be studied and the speed of the rolls adjusted to that peripheral velocity which is found to produce the most satisfactory result. When rolls are run at a speed which causes the rock to slip on the line of contact the rolls will be found generally to wear away more rapidly than where they are run at a slower speed. Some soft "metallic" ores, such as those containing galena, graphite, etc., will cause the rolls to become glazed if run too fast, but crush readily when run at proper speed. With some hard material it is found that the rolls will not "nip" the ore or matte under a stated angle, for pieces of given size. This necessitates the setting of the rolls at a greater or less distance apart. Where rolls are run at very high speed it is sometimes found that the pieces of ore falling between the rolls rebound, and are met by other falling pieces, only to rebound again. The result is the rolls become choked. In such cases the speed of the rolls must be reduced until the material passes through readily. In crushing very hard, dense rock in rolls it is desirable to have the ore crushed to comparatively small size by rock breakers before it is fed to the rolls. Tough minerals require a less angle of nip than those which are brittle and soft. Granular ores will stand a wide angle of nip. In wet crushing the fines adhering to the rolls may cause the ore to crush more rapidly than when dry.

## Geology in Mining.

Written for the MINING AND SCIENTIFIC PRESS.

The gold mines of Angels Camp, Calaveras county, Cal., have been operated almost constantly for nearly fifty years. Originally a rich placer camp, the quartz veins later received the attention which their extent and richness deserved; but in the earlier history of quartz mining there the results were not always all that could be wished by the mine owners, though often the surface outcrops were found to contain valuable accumulations of gold—pockets which paid handsomely—and it was largely to these that the rich placers owed their origin. In time, as development progressed, one of the numerous veins was determined to be more persistent and of greater value than the others, and this eventually became the scene of extensive mining and milling operations. The evolution of a definite knowledge of mining geology in the Angels district has been a slow process, due largely to a close adherence to the miner's text, "Stick to the ore." Briefly stated, the gold-bearing veins of the district are largely quartz, with more or less calcite, and an admixture of magnesian material—the partly silicified schistose rock in which the veins occur. The formation is chiefly amphibolite schist, with a few intrusive dikes of diorite and other basic rocks. The width of country throughout which these gold-bearing veins occur is about 4 miles, reaching from the foot of Bear mountain, west of Angels, to a mile east of the town. The principal ore-bearing fissure thus far developed is along a zone of fracture extending in a generally northerly and southerly direction and conforming nearly to the strike of the enclosing schists. This zone of shearing, crushing and mineralization near the surface dips at a high angle—70° to 80° to the eastward—which conforms nearly to the dip of the schists. On this zone are located the Sultana, Bovee, Angels, Lightner, Utica-Stickle and some other mines, all of which have extensive development, and some of which have been largely profitable. In the vicinity of this fissured zone are several other fissures, on which valuable mines have been developed; but geological conditions of greatest interest are those affecting the principal fissure as above indicated. The mines named have been worked successfully from the surface to shallow depth, as in the Sultana, down to a depth exceeding 1000 feet, as in the Stickle, this depth becoming increasingly greater from the north end, as in the Fritz and Bovee (Sultana), toward the south, each mine to the southward finding the rich ore to extend to a greater depth than its adjoining neighbor on the north. Thus in the Sultana the good ore was discovered on the surface, but did not extend below 100 to 150 feet in depth. At the north end of the Angels mine it quit at 200 to 300 feet, and in the south end it extended to over 400 feet. In the Lightner it went still deeper, and this depth was found to be correspondingly greater in the Utica, until it reached and exceeded 1000 feet in the Stickle mine. The ore was usually found to terminate upon a talc "foot wall," and it was supposed until recently that the ore bodies had no farther downward extension.

West of this mineralized zone, which has produced in the aggregate many millions of dollars in gold, is found a heavy white quartz cropping, which strikes proceeding northward in a more easterly direction than the Stickle-Sultana vein, and dips at about 45° to 50° easterly, instead of at 70° to 80°, as in the latter. This white and usually barren vein intersects the main pay zone obliquely, the line of intersection being farther and farther from the datum plane at the surface as it goes southward. It is down to this plane of intersection that the ore bodies above referred to have been worked. The intersecting later vein of "bull quartz" occurs as a series of lenses of varying size. The plane in which these lenses lie is that of a fault fissure in which there has been great movement, the character of which is not fully known to the writer further than that there has been a reverse fault, the hanging wall side having been thrust upward relatively to the foot wall of the intersecting vein.

How important the discovery of this fact is in the possibilities presented for the perpetuation during an indefinite period of the mining industry in Angels is well understood by those who realize that the ore bodies now largely depleted lying above the fault plane may be found to continue to great depth below it.

Underneath the "bull" quartz vein the long-continued movement of the rocks has crushed the upturned edges of the greenstone schist, sheared and altered them until it has become a mass of talc schist, varying from a few feet to upwards of 100 feet in thickness. This zone of talc, which conforms to the dip of the fault plane and not to that of the amphibolite schist in which the veins occur, forms what has been considered for years as the "foot wall" of the ore bodies, although these ore bodies did not possess this talc wall from the surface, but were always found at a greater or less depth, according to the position of the mine, and always acting as a barrier to the downward extension of the pay zone.

Some months since the vertical north shaft of the Angels mine was continued downward through the talc zone, entering a region of normal amphibolite

schist. As no ore was found in the shaft, crosscuts were run, and in the east crosscut a zone of gold-bearing rock, similar to that above the fault, was encountered. This has been explored and was found to consist of several lenses of pay rock, not unlike that worked in former years above. Subsequently, the Sultana company, on the north side of the Angels mine, found the downward extension of the vein in a similar manner by sinking vertically through the talc and crosscutting to the eastward.

In the Lightner mine, which joins the Angels mine on the south, the same procedure has resulted in the discovery of three essentially parallel veins beneath the fault. Prospecting is proceeding in the Utica-Stickle mines; but the discovery of the vein has not yet been announced, though doubtless it will be found there also. It is probable that the course of the pay zone above and below the fault plane will be found diverging to the southward, which would necessitate longer crosscuts as the work of development proceeds southward along a given line. The development of this important geological condition at this late day on the "Mother Lode" of California indicates the necessity of a more careful study of geological conditions generally. It is never safe to rely on an assumption, but to prove theories by development. There are doubtless other structural problems of importance along the gold belt which remain as yet unsolved. At Sutter Creek and near Jackson, in Amador county, are geological conditions not fully understood as yet and of which a knowledge can only be gained by more or less extensive development in the section involved. Near Plymouth, also, in Amador county, in the Pioneer mine, is found complex disturbances involving the unexpected disappearance of a rich body of ore, which problem has never been satisfactorily explained. Numerous others might be mentioned, and in some instances no doubt the existing conditions are assumed not to be of unusual character, as was formerly the case at Angels, until the discovery of the real condition results from systematic or hit-or-miss exploration. W. H. S.

## Gold Placers of Fairbanks District, Alaska.

Among the placer fields of Alaska that attracted attention during 1903 were those of Fairbanks district. In Bulletin 225, entitled "Contributions to Economic Geology, 1903," recently published by the United States Geological Survey, L. M. Prindle has a brief description of this district, which is an abstract of a more complete report in preparation.

The area described lies between Chena and Tolovana rivers and is drained by their tributaries. It is 140 miles southwest of Circle, 200 miles in a straight line west of Eagle, and perhaps 200 miles above the mouth of Tanana river. This region forms a part of what is known as the Fairbanks district, where present interest is directed mainly to the valleys of a few small streams, which head close to one another just within the hill country about 12 miles north of Tanana river. Gold was discovered on one of these tributaries of the Tanana in July, 1902, on Pedro creek. In the report of the Peters & Brooks expedition of 1898 prospectors were advised to look for gold in the streams entering the Tanana from the north and heading opposite the gold-producing creeks of the Forty Mile and Birch Creek regions. The streams in which gold has been found in the Fairbanks district all head far back in the Yukon-Tanana divide and flow westward or southward.

The creeks of present economic importance are Pedro creek, called Gold stream below the point where Gilmore enters it, and Twin creek, a tributary of Pedro; Cleary creek, with its tributaries—Chatham and Wolf—and Fairbanks creek. They are but a few miles apart and are separated by broad divides that rise 1000 feet or more above them, and flow in divergent courses—Pedro towards the southwest and west, Cleary towards the northwest, Fairbanks towards the east.

These are the only creeks in the Fairbanks district which up to the present time have afforded paying deposits. The conditions of the occurrence of gold on all of them are essentially the same. No foreign wash has been observed, and it would seem that the gold is derived from the rocks in which the creeks have cut their channels. The pay is generally found at considerable depth and, except at a few localities, in frozen ground. The creeks are small, carrying hardly sufficient water for extensive operations, and their grade is low. Timber for mining purposes on most of these creeks must be freighted for several miles from the lower valleys. Trails along the ridges are mostly good, but where they traverse the swampy areas along the creeks they are generally bad.

Although no large values have yet been discovered, the gold seems to be well distributed along the creeks where it has been found. In some localities gold is known to occur in sufficient quantity to pay for working even under the present unfavorable conditions. Notwithstanding the inaccessibility of the district, which can be reached only by trail, the high prices of supplies, and the lack of money necessary for the development of claims, this district produced from \$30,000 to \$35,000 during the short summer of 1903.

## Mining and Ore Treatment in Western Australia.\*

NUMBER V.—CONCLUDED.

Written by DONALD CLARK.

The gold dissolves readily at first, and then solution takes place more and more slowly, until the commercial limit is reached. The state of the roast is the essential factor governing the success or failure of the process. It is found that if alkaline sulphides are present not only does the solvent action of the cyanide cease, but that a partial precipitation of gold takes place. For instance, at one of the prominent mines, the following results were obtained:

The solutions flowing into the settlers contained 40 grains of gold per ton. The solution was then made up to the desired strength with cyanide. One hour after adding KCy solutions assayed 50 grains per ton; 4½ hours, 42; 8½ hours, 40; 12½ hours, 37; 16½ hours, 25; 28½ hours, 25. Had the solution gone on in the regular way, the value would have been about 170 grains per ton. This sample was found when tested with the lead carbonate method to give a sulphide reaction. The method adopted for the quantitative determination of sulphur is based upon the qualitative test already described. About 5 grams of ore are boiled with about 50 c.c. of 5% NaOH for about five minutes. This is filtered, washed, and the filtrate diluted to 200 c.c. with cold water. It is then made faintly acid with acetic acid and titrated with decinormal iodine solution. The reaction  $H_2S + I_2 = 2HI + S$  is quantitative, and the end reaction with starch as an indicator is sharp. This method will indicate not only sulphur, but any other compound which can be raised to a higher state of oxidation by iodine. Further, it assumes the decomposition of all sulphides by the caustic alkalis. By this method of indicating sulphur, only 0.03% was shown to be present in the case of the ore, which refused to yield its gold to the KCy solution. Assuming that the sulphur is present in the state of soluble sulphide, and that the following equation is a quantitative one— $K_2S + KCy + H_2O = KCyS + 2KOH$ —then each atom of S destroys a molecule of KCy, or double its weight, so that 0.1% of S means 2.24 pounds of S and a destruction of 4½ pounds of cyanide per ton. The addition of soluble lead salts to the solution, in order to precipitate the sulphur of the soluble sulphides as sulphide of lead, does not appear to be carried out at any of the mines. A test which has to be carried out regularly is the determination of the alkalinity of the solutions from the ore. Now, as water is not used for moistening the sand, but dilute KCy solution, the problem is to determine that of the liquid, independent of the KCy present. This is done by running in  $AgNO_3$  solution, using KI as an indicator, and taking it to opalescence. This fixes the KCy; a few drops of alcoholic phenolphthalein solution is added, and the alkalinity indicated. This is titrated with decinormal HCl. The protective action of an alkaline on KCy is now very well known, and care is always taken to see that there is always free alkali present. If the solution from an ore is neutral a small amount of lime is added.

What the effect of moistening finely divided hot ore with KCy solutions is, cannot be definitely stated, but it would seem from some instructive experiments carried out by S. Radcliff, the metallurgist to the Chance mine, Cassilis (V.), that a great deal of cyanide is destroyed.

Mr. Radcliff was struck with the amount of KCy decomposed on running a solution through dry sand, and found the finer the sand the higher was the consumption. In order to find the relationship between the size of the particles and the consumption of KCy he powdered some clean glass and sieved it through various sized sieves. He determined the amount of cyanide in his original sample, the amount retained on the glass and the amount oxidized to cyanate. Twenty-five c.c. was used in each case; this was washed with 25 c.c. distilled water.

The method of treatment at the Great Boulder of sending back the water washes from the filter presses, in which there is a minimum amount of cyanide, is one to be recommended.

The treatment of the pulp after its gold has been dissolved in the agitators is an adaptation from modern chemical practice. First of all are the monteju, of which there are four, into which the slimes from the agitators pass. Each monteju has a capacity of 500 cubic feet, and is simply a steel pressure tank, fitted with a pipe through which air may be delivered, and another pipe reaching nearly to the bottom and leading to the filter presses above. By admitting air under pressure the pulp is forced up to the other tube as water is forced out of a wash bottle. The pulp is forced into a filter press, taking but a few minutes to fill it; as soon as the press has been filled, water is turned on to wash the cakes, and finally a current of air to dry them.

A filter press is a mechanical contrivance for separating finely divided solids from liquids; in its simplest form, it might consist of three square or rectangular frames, like the frames of a schoolboy's slate, tightly clamped together, the press being

\*Abstract Australian Mining Standard.

solely for the purpose of drawing the frames together, and not, as might be imagined, of forcing solutions through. The middle frame is open—that is, a frame without a slate in it; on one side of this open frame is another, which contains a corrugated plate instead of a slate; over each side of the corrugated plate lies a sheet of punched iron, or a screen; on the other side of the open frame lies another frame similar in construction to the first. A sheet of filtering cloth is doubled over the open frame. If water and slime are forced through a lateral opening into the open frame, then the liquid will escape through the filter cloth, then through the screen, and find its way between the corrugated plate and screen. By providing a lateral tap on this frame, water may be drawn off, and the open frame filled with a cake of slime. By closing the lateral opening through which the slime entered, and forcing water through a lateral opening between the corrugated plate and the screen, the liquid will pass through the screen, then through the filter cloth, then through the slab of slime in the open frame, through the filter cloth on the other side, then through the screen, and find its way down the corrugated plate, when it may be drawn off. Similarly air may be forced through to displace water or solutions. Instead of three frames, a great many are clamped up together. All of these have projecting lugs on their corners. Through these lugs holes are bored, which form a continuous pipe when the frames are in position. Lateral openings are made into each frame from one or other of these pipes, in accordance with its purpose. Each frame must be planed up accurately to minimize the danger of leakage; also, strips of tarred blanket are laid along the faces, so as to serve as packing. The filter cloths which lie over the open frames are

great diversity as to the number employed for a given quantity of slime, yet at all mines they appear to work well. Practically one size is adopted, and for increased capacity the number is added to. The spitzkasten is, as the name implies, a pointed box, the dimensions being 6 feet square and 6 feet 9 inches deep, the slope starting 1 foot from the top. The inverted pyramid is really 6x6x6 feet. These are constructed of  $\frac{1}{2}$ -inch mild steel, riveted on to angle iron, 2x2x $\frac{1}{2}$ -inch at the edges;  $\frac{3}{4}$ -inch rivets, spaced 1 $\frac{1}{2}$ -inch centers at the sloping edges, and 3-inch centers on the upper edges, are used. The plates forming the sides, if more than one, are riveted with  $\frac{3}{4}$ -inch rivets, 1 $\frac{1}{2}$ -inch pitch, the lower plate to overlap, so that no slime will collect on the ledge. The bottom of each box terminates in a cast iron cap, fastened on with  $\frac{1}{2}$ -inch cup head bolts, and packed water tight. A 2 $\frac{1}{2}$ -inch gas tap opening is provided; a pipe with valve attached screws into this, and so allows of regulation of downward flow. The boxes are arranged in series, connected into a square or rectangle. Each series has one or two smaller conical boxes preceding it. These are about 2 feet and 2 feet 6 inches in diameter, and 2 feet 8 $\frac{1}{2}$  inches and 3 feet 2 $\frac{1}{2}$  inches deep respectively. A cast iron cap, with screw for a 2-inch gas pipe, is provided below. The distances between the centers of the boxes are 2 feet 8 inches, 4 feet 8 inches, and 6 feet respectively. The slimy water flows from the sand separators, from the bottom of which any sand or heavy particles of amalgam are led back to the pans. The lighter material from one spitzkasten to another is settled and drawn off from the bottom of each at about a 1 to 1 consistency, while the clearer and clearer water overflows from each until it finally passes into a launder almost clear. How strange it

arrayed against experts to prove the theories of their respective principals?

The citation of mining in Texas as compared to that of New Mexico is not a happy one, for there is no government land in Texas, and the prospector has not the same rights of location.

It is a novel theory to me that mining litigation fosters and induces prospecting and mining.

It strikes me that laws which effect a reduction of litigation evidence a minimum of injustice, which of itself is an attraction to rich and poor.

San Francisco, Aug. 9.

M. P. Boss.

TO THE EDITOR:—The apex or extralateral right is certainly legal. It is also an equitable right. No prospector ever goes hunting for land by the acre. He wants a vein and cares little for the land. If he finds a vein, the law gives him that vein as far as he cares to follow it.

The apex litigation is not caused by the law, but by the attempt of the dishonest sidelineer to get something that doesn't belong to him. There would be little or no trouble if B would let A's vein alone and find one for himself.

Tonopah, Nev.

MINER.

## THE PROSPECTOR.

Where timber is not available for staking mining claims, the prospector may build a substantial monument of rocks. Make every monument of good size, and do not fail to place any that are required to make the outlines of the claim perfectly plain to any one who may be interested in tracing them. Each monument should be in plain sight of the next one on the line, and, if trees or brush intervene, they should be removed. If a change in the slope of a hillside causes the monuments to be hidden from each other, intermediate monuments should be placed, so that the lines may be readily followed. The greater the value of the mine proves to be upon development, the more important is it that the location be properly made. Faulty locations are the source of much subsequent litigation, and in some instances have caused the owner to lose his claim. It is the best practice for business reasons to comply as fully as possible with the requirements of the laws—Federal, State and local.

The appearance of the oxides and carbonates of metals in surface outcrops, known to miners and prospectors as "blossom," is merely an indication of the minerals lying below, and not usually an index of either their amount or grade. Thus an iron gossan, nearly or entirely destitute of copper ores, may cover a large and valuable deposit of sulphide copper ore.

Gold is sometimes found in payable amount in large white outcrops of white quartz, but not frequently. A mineral stained (iron oxides) quartz is more attractive, but this should not detract from an investigation of the barren-looking and often glassy quartz, for this rock is sometimes rich. Intrusive dikes are often found to contain precious metals, and should be investigated as well as quartz veins. Quartzites not infrequently are gold bearing.

The white mineral samples from Livermore, Cal., are both magnesite, one being the soft and the other the hard variety. The two black, heavy minerals are manganese oxide (psilomelane) the bluish black one and chromic iron the spotted one. The spots and veinlets in the last mentioned are serpentine. This class of ore can be concentrated to a high-grade chromic iron.

The whitish-green rock from Bisbee, Ariz., is silica—a fine-grained quartz rock, probably the result of alteration of limestone, as this is a common occurrence in that district. Similar phenomena occur in Shasta county, Cal., and elsewhere.

The ore from Grizzly Flat, Cal., is mostly pyrrhotite—a subsulphide of iron slightly magnetic. With it occur pyrite and marcasite and a small amount of chalcopyrite. The iridescent tarnish is due to the presence of copper. The lace-like structure of the pyrite is not of uncommon occurrence on the east lode of California.

There are four commercial ores of iron, viz., the red oxide (hematite),  $\text{Fe}_2\text{O}_3$ ; the brown oxide (limonite),  $2\text{Fe}_2\text{O}_3 + 3\text{H}_2\text{O}$ ; magnetite (the magnetic oxide),  $\text{Fe}_3\text{O}_4$ ; and siderite (the carbonate),  $\text{FeCO}_3$ . Often these ores are found almost pure, but usually they are mixed with silica, alumina and other earthy minerals.

ANY MAN who ever worked in the mines of Montana, or any of his male descendants, is eligible in a competition examination to be held from Sept. 19th to Sept. 24th at the State School of Mines, Butte, Mont., for a scholarship in the School of Mines at Columbia University, New York, which carries with it an income of \$1000 per year. The scholarship has been established by a daughter of Marcus Daly. Inquiries concerning the matter should be addressed to Prof. W. G. King, School of Mines, Butte, Mont.

Spitzkasten at Great Boulder Mine, Western Australia.

stitched together in two or three places, where they project, so as to prevent them giving when the pressure is applied. The whole of the frames, which are vertical, are carried on horizontal bearers by means of projecting arms; they are brought together by means of powerful screws, or by hydraulic pressure.

When a press is empty, slimes are forced in, either by pumps or by the compressed air of the monteju. The mud flows along the slime passage pipe and rushes into the open frames; air is displaced and the solution starts to run through. Taps are turned off and the liquid finds its way through the filter cloths, thence through the filter frames; in from fifteen to twenty minutes a press is full of hard caked slime. The cakes are next washed. Connection with the pressure tank is cut off, wash water is forced into a frame on one side of the cake, this passes through the cake and escapes on the other side, the pressure applied being about eighty pounds per square inch, the time taken for washing being about twenty minutes. Air is then passed through in the same direction as the water. This serves to displace nearly 50% of the water that would otherwise remain in the cake. Even after air washing they contain from 15% to 20% of moisture. The press is then opened by unscrewing or releasing the hydraulic pressure. The frames are slid along the bearers; the slabs of semi-solid slime are knocked out; these fall into trucks below, the filter cloths scraped wherever necessary, the frames brought together and tightened up again, the press then being ready for another charge; the time taken for emptying and closing being about twenty minutes, or an hour in all. As an actual example, a solution containing 0.17% KCy before agitation, contained 0.09% after treatment, and 0.05% after washing the cakes. The slimes assayed 5 dwt. before treatment and 1 dwt. after treatment; the consumption of cyanide being 47%, the displacement of KCy solution by water 44%. The actual cost of labor in filter pressing is not high. Two men, paid at the rate of 11s. 9d. per shift, deal with ten presses of four tons capacity each in that time.

One of the most interesting innovations on the field is the spitzkasten used for thickening slimes and clarifying solutions. The old rules with regard to their dimensions are ignored, and though there is

is that the terrible bugbear of the old-time amalgamators and concentrators should be looked upon as a blessing by the modern metallurgists. Avoid making slimes was the old, and slime everything the newest, doctrine. But since slime production and treatment is much more expensive than the older methods, the latter is much to be preferred when there is no advantage in fine grinding.

## The Extralateral Right.

TO THE EDITOR:—It was with considerable surprise that I read your editorial under the title of "The Extralateral Right Law," and saw there a practical reiteration of a statement made by your correspondent in Africa—Mr. Van Wagenen—to wit: "I would say that it is only necessary to live in a mining region where vertical boundaries prevail and observe the deadening influence on the community."

Now, as I have lived many years in Mexico, and held mining interests in five of her States, I have had some experience in vertical boundary lines, but have never seen that "deadening influence."

On the other hand, it seems to me that the American prospector is as much in evidence in Mexico as he is in his native land.

I was so situated in that republic that I was often called upon by Americans for advice as to the best part of Mexico in which to prospect. My invariable reply was that I knew of no section that had not been and that was not being run over by foreign prospectors.

Time and again I have heard that feature of the Mexican law extolled by Americans, but I cannot recall of once hearing there an expression against it, and it is my firm conviction that if a vote could be taken of every American miner and prospector in Mexico upon the point in question 99% would be for vertical boundaries. When a title is once obtained it is unassailable and immovable, and no one, however poor, need fear of being forced out by a powerful neighbor.

In contradistinction, who that has long been familiar with mining in the United States cannot recall at least one instance wherein a title was involved by the scientific tracing of stringers and experts were

## The Ore Deposits of Bisbee, Arizona.\*

NUMBER V.

Written by F. L. RANSOME.

**FORM AND GEOLOGICAL ENVIRONMENT OF THE ORE BODIES.**—The Bisbee copper ores as exploited in the Copper Queen, Calumet & Arizona and Lowell mines occur for the most part very irregularly as large masses in the Escabrosa and Naco limestones. The horizontal dimensions of these ore bodies are usually much greater than the vertical. They are rudely tabular or lenticular in form, and lie generally parallel to the bedding planes of the inclosing limestones. Definite walls are exceptional. As a rule, the oxidized ore passes gradually and irregularly on its peripheries into so-called "ledge matter," consisting chiefly of soft limonitic clays, which in turn grade into more or less altered limestone. The unoxidized sulphide ores may exhibit a peripheral transition either to oxidized ores or to metamorphosed limestone impregnated with pyrite.

Under these circumstances the actual shape of an ore body is variable, being dependent upon the price of copper and the economic conditions of working. It is possible, however, to gain a fairly definite idea of the size and form of typical ore bodies by considering some of the older stopes, which, while not exhausted, have yet run through the ore at so many points as to establish its general contour.

The accompanying figures show plans and sections of three such typical stopes in the Copper Queen mine. On any single horizontal plane the dimensions of the ore masses rarely exceed 150 by 200 feet, but series of connected stopes indicate that in general plan these figures may be considerably exceeded. Thus the stopes northeast of the Holbrook shaft indicate the existence of a practically continuous body of ore and "ledge matter" about 800 feet in length and 600 feet in width. On the other hand, the actual maximum thickness of the ore bodies hitherto extensively worked rarely exceeds 125 feet.

**RELATION OF ORE BODIES TO THE BEDDING OF THE LIMESTONES.**—The statement that these very irregular tabular or lenticular masses of ore lie parallel with the bedding planes of the inclosing limestones is the simplest expression of a general relation and requires some qualification when the ore bodies are studied in detail. It is then found that the original structure of the limestone in the vicinity of the ore is very much obscured by metamorphism, if it is not entirely obliterated by the extensive formation of ferruginous clays resulting from the oxidation and decomposition of the ores and country rock. Furthermore, the ore sometimes cuts across the bedding of the limestones for considerable distances, as will be later shown.

Owing to the extensive alteration of the limestones in the vicinity of the ore bodies, observations on dip and strike of the beds can be made in but a small part of the extensive underground workings of the Copper Queen mine. Such observations as were recorded indicate a general southeasterly dip of less than 20°. But there is much diversity, and the beds were evidently subjected to considerable local disturbance prior to the deposition of the ore. At the old Queen incline, which follows the bedding, the dip is about 40° and is toward the south. This steep and unusual local dip apparently accounts for the exceptional attitude of the original Queen ore body, a roughly cylindrical mass 60 feet in diameter and 400 feet in length, which, according to the section shown in Fig. 3, had its axis more nearly vertical than horizontal. As this body presented some points of difference from those now open to study, the description of it by Mr. Douglas may be quoted. He writes in Transactions of the American Institute of Mining Engineers:

"The outcrop of copper which was first attacked, and which was, in fact, the only extensive surface indication, was on the northern exposure of a limestone hill. In this place stripping revealed a solid body of oxidized copper, iron, and manganese ore over 60 by 60 feet in area, and so rich in copper that the furnace, fed from the surface ores, yielded for a few months 23% of metal. \* \* \* This large outcrop was inclosed in an almost circular unaltered limestone frame. Associated with the ore was an abundance of calcite. The percentage of silica was so small that quartz had to be added to the furnace charge. This body, retaining its general dimensions and well-defined limestone walls, dipped at an angle of about 30° southeasterly into the hill. Between the 100 and 200-foot levels the ore changed into a clay, with well-marked bedding, too lean in copper carbonate to be profitably worked, but below this zone of clay the copper, as carbonates and oxides, increased to 12%, and was associated in a measure with limonite, embedded in ferruginous clay. This ore body extended to a depth of 400 feet on the incline from the surface, and there terminated abruptly in hard limestone."

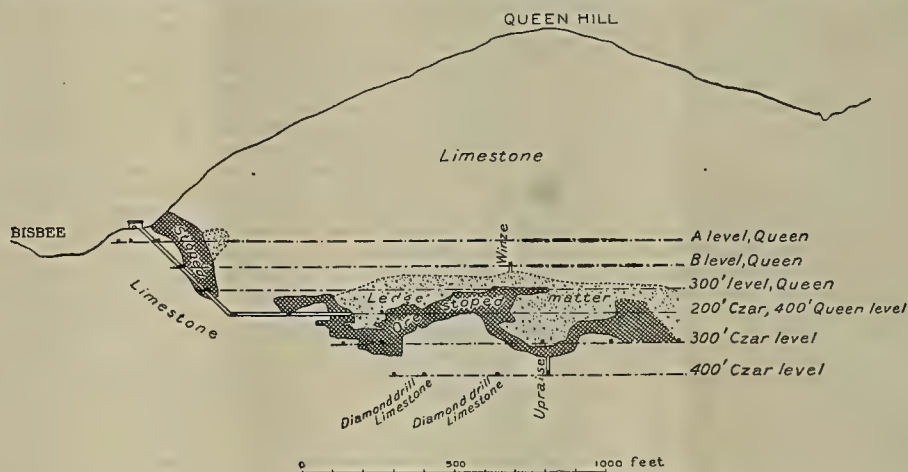

This single ore body yielded about 80,000 tons of ore and 20,000,000 pounds of copper.

Between the Queen incline and the Holbrook shaft,

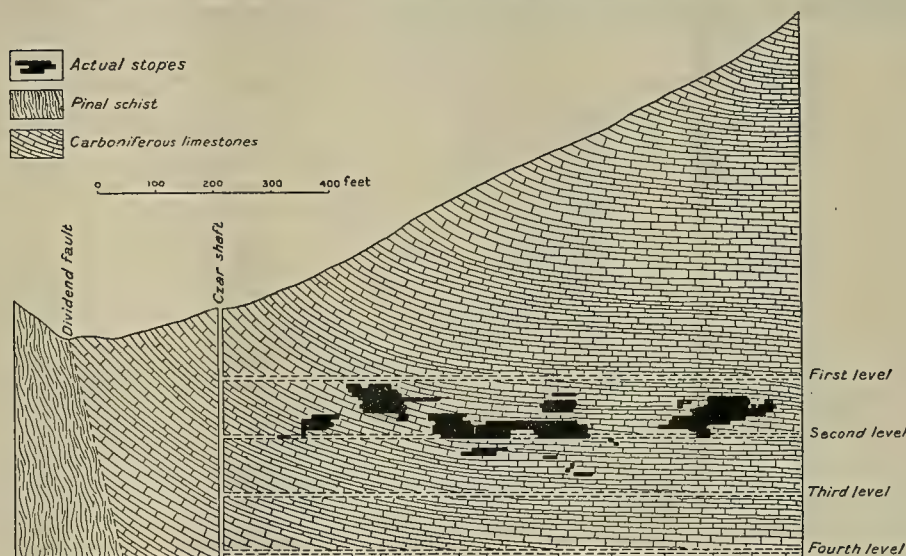

and southwest of the Czar shaft, the usual gentle southeasterly dip seems on the whole to prevail, although opportunities for satisfactory observation are rare. The very important ore bodies occurring in this part of the Copper Queen mine have been found on the whole to be nearly horizontal. As a rule, very few traces of original bedding are discoverable in the much altered, mineralized and decom-

posed material occurring within 500 feet of the probable position of the Dividend fault.

to follow what seem to be bedding planes in the mineralized limestone. In the Calumet & Arizona mine the limestones maintain their general southeasterly dip, but are more steeply inclined than in the adjoining Copper Queen workings, the average dip being about 35°. Stopping had not gone far enough in this mine at the time of visit to demonstrate the approximate shape

Section of the Copper Queen Mine Through the Open Cut and the Southwest Stope.

Cross Section of Copper Queen Mine, Bisbee, Arizona.

Diagrammatic northeast-southwest section through the Czar shaft of the Copper Queen mine, showing the general structural relation of the ore bodies. The black shows actual stopes. The structure of the limestones is generalized and no attempt is made to distinguish mineralized limestone or the altered clayey material known as "ledge matter" from the normal unaltered beds.

Plans and Sections of Stopes in the Copper Queen Mine, Showing Approximate Forms of Typical Ore Bodies.

posed material occurring within 500 feet of the probable position of the Dividend fault.

In the Spray workings the general dip of the limestones appears to be toward the southeast at an angle of about 15°. The ore bodies correspond roughly to this gentle inclination. This fact was particularly noticeable in the case of a relatively small body of chalcopryite ore being stoped in the seventh level at the time of visit. On the eighth level, also, it was noticed that bands of pyrite show a marked tendency

of the large ore bodies. There is little doubt, however, but that they are of the same general character as those worked from the Spray shaft, although more noticeably inclined in conformity to the increased dip of the inclosing beds. There is observable in the deeper levels of this mine the same pronounced influence of the bedding planes in directing pyritic impregnation as was noted in the Spray.

The development of the Lowell mine is as yet insufficient to throw much light on the shape and extent

\* Abstract Professional Paper No. 21, U. S. G. S.

of the ore bodies. They are evidently of irregular form, but lie with their two greater dimensions parallel to the bedding planes of the limestone, which here have an easterly dip of from 35° to 45°. These ore bodies are undoubtedly of the same general type as those found in the Copper Queen and Calumet & Arizona mines.

### Engine Air Compressor.

Herewith is illustrated a 10 H. P. "M & W" engine air compressor now in operation at the new building at Forty-second street and Park avenue, opposite

Geared Air Compressor.

the Grand Central Depot, New York City, now in course of construction. The air compressor is an 8x8, giving 70 cubic feet of free air per minute against 80 pounds pressure. It was installed by the contractors, Ritchie, Brown & Donnelly, to furnish air for their pneumatic tools, and furnished by August Mietz, 128-138 Mott street, New York City.

### The Cockerill Gas Engine.

The Cockerill gas engine illustrated herewith is of the four-cycle type, in which only one impulse caused by the combustion of the gaseous mixture takes place during one stroke of the complete cycle or in two revolutions. The engine acts as a pump as well as a motor. The gas mixture is drawn in during the first or forward stroke, and compressed during the second or return stroke, exploded in the third, forward, stroke and exhausted in the fourth, return, stroke,

former, this method resulting in constant compression.

By this latter method the mixing valve remains lifted up during the entire suction stroke. The gas valve opens at a certain point during the suction stroke, and remains open until nearly the end of the stroke. The point of opening is variable, and is determined by the governor at all times; the quantity of gas admitted is intended to be in exact proportion to the load of the engine, the compression to remain constant.

The engines are provided with magneto-electric igniters of the most improved system. The starting of the engine is effected by compressed air. The Wellman-Seaver-Morgan Co., of Cleveland, Ohio, say: "We guarantee a heat consumption of 10,000 British thermal units per brake horse power per hour, and a thermal efficiency of 25% at the rated capacity of the engine."

### Tin Deposits of the York Region, Alaska.\*

Written by A. J. COLLIER.

Tin is known to be irregularly distributed in the York region over an area of about 450 square miles, embracing the western end of the peninsula. Its occurrence in alluvial deposits has been verified by the United States Geological Survey at three localities, and the existence of tin-bearing lodes has been observed at two points. The extreme points known are 25 miles apart. In addition to these, prospectors report the occurrence of tin at a great many other places, either in lode or placer form, and though it has not been possible to verify these reports, there is reason to believe that they indicate a more extensive distribution of tin ores. Many of the reported discoveries lie beyond the limits of the York region and indicate that the tin districts extend 100 miles or more to the northeast.

The tin ore is almost all cassiterite (tin oxide), though some stannite (sulphide of tin, copper and iron) has been found. In the bedrock two essentially different types of deposits are represented. The ore occurs in veins cutting phyllites or metamorphic slates, and is disseminated through more or less altered granitic dikes. The lode deposits of the latter type give promise of commercial importance. Lode deposits of the former type have not been discovered in place, but the occurrence of tin-bearing quartz veins

and which have been examined in some detail are Lost river, Cape mountain, Buck creek, Buhner creek and Anikovich river.

**LOST RIVER.**—Lost river enters Bering sea about 15 miles southeast of York, 25 miles west of Teller, a town on Port Clarence, and 10 miles northwest of Point Spencer, at the entrance to Point Clarence. The river has a length of about ten miles and drains the central part of the York mountains. The mountains constitute a nearly circular area of rugged land forms, about 15 miles in diameter. The summits rise to a general level of about 2500 feet, and, as noted, reach a culmination of 2900 feet in Brooks mountain, near the north side of the area, which is the highest point in the northern part of Seward peninsula.

On the seaward side the Cape York bench is bounded by steep bluffs, which at places front directly on Bering sea and at other points rise from a lower and younger bench nearly at sea level. This lower and newer plane, from the mouth of Lost river eastward to Port Clarence, has a width of  $\frac{1}{2}$  mile to 3 or 4 miles. It is in part a rock bench and in part a gravel-built coastal plane. Immediately north of Port Clarence the lower coastal plane is fringed by a wide lagoon, cut off from Port Clarence by a sand spit.

The York mountains are generally devoid of the tundra vegetation which covers so much of the Seward peninsula; and along Lost river, from the coast to the tin deposits, can be found an exceptionally good roadbed for this part of Alaska. For one traveling on foot it is as firm as an ordinary macadamized road, and owing to the ease with which the trip up the river is made, the distances are likely to be underestimated by persons who have traveled in other parts of Seward peninsula. Lost river forks about  $\frac{1}{2}$  miles from the coast, one branch continuing in a nearly due north direction, while the other drains a country to the west that has not been examined by geologists.

About 4 miles from the coast the north fork of Lost river divides. The eastern branch is Cassiterite creek; the western, which is somewhat larger, rises about 3 miles to the north, in the slopes of Brooks mountain.

The Lost river tin deposits are located on the east side of the north fork of Lost river. The ore has been found on Cassiterite creek and on another eastern tributary, known as Tin creek, which enters Lost river about a mile below the mouth of Cassiterite creek. The latter stream has a length of about 3 miles; its head is within 1 mile of Cassiterite creek, and after flowing parallel with Cassiterite creek for about 1 mile it turns westward and enters Lost river from a deep canyon cut in the limestone of the York mountains. At its mouth, Cassiterite creek is about

Cockerill Blast Furnace Gas Blowing Engine.

this action taking place on each side of the piston, as the cylinders are built double acting. The Cockerill engine is constructed with one, two or four cylinders—either single, tandem, twin or twin tandem; so that the two-cylinder engine has the same power delivery as a single cylinder steam engine, and the four cylinder engine as a duplex steam engine. The valve gear is actuated by a second motion shaft, driven by gearing from the crank shaft and running at half the speed of the same. It is located parallel to the axis of the engine, and carries the cams or eccentrics which operate the valves. The inlet valves are situated on the top and the outlet valves on the bottom of the cylinder, designed to secure ease of accessibility.

The regulation is effected by a governor which controls the admission of the mixture of gas and air either by automatically cutting off or by throttling a constant mixture, either of which produces variable compression; or, by varying the relative volumes of air and of mixture, the latter always following the

in slates is inferred from the distribution of the placer tin and from pebbles of slate containing small tin-bearing quartz veins, which have been observed in the gravels. It should be noted that no granite has been found in the slate area, and there is no positive evidence that the tin there has any genetic relation to granite intrusives.

From a comparison of the evidence at hand with the facts known with regard to the older tin-bearing districts, it seems to be at least possible that the tin lodes of both types are connected with intrusive granite bodies, some of which have been exposed by erosion, while others are still deeply buried. These granites, which probably were intruded at about the same time, mark a zone of plutonic activity extending from the Diomed islands northeastward, parallel with the Arctic coast, for 100 miles or more. The localities from which tin ore has actually been obtained by United States Geological Survey parties

100 feet above the sea. In the latter part of July, 1903, Lost river carried approximately 1000 miners' inches of water.

The York mountains, in which the Lost river basin lies, are composed almost wholly of gray limestone of Silurian age. Along Lost river the limestone shows little general metamorphism, and as a rule dips at low angles. From the coast to Tin creek the strata generally dip to the north, and unless there are faults, which were not detected, a thickness of over 5000 feet of limestone must be exposed. Near the mouth of Lost river a section of these limestones lying nearly horizontal is exposed in a mountain, called by prospectors Saddleback, which has an elevation of more than 2000 feet above sea level. Dikes of rhyolite cut this limestone at several places along Lost river, and a number of these were readily traced across the limestone by a growth of moss and other vegetation which formed over them, the limestone itself being utterly devoid of vegetation.

\*Abstract Bulletin 239, U. S. Geol. Sur.

### Knotty Problems.

Every one whose duties require him to handle ropes is interested in the various methods of making quickly knots for the varied purposes for which ropes are used. The accompanying engravings illustrate better than can be described the methods of making

part. If it is used for hoisting, it should be of no larger diameter than the original size of the rope.

Splices can be made very quickly, and where a strong, quick splice is desired, it can be done by unwinding the ends of the rope and by simply braiding the ends together. You have a very simple and strong splice, but it is thicker than the original diameter of the rope.

very strong splice, and, if the ends are properly tucked in, it will be no larger than the original diameter of the rope, and can be used over pulleys or where it is necessary that the splice be no larger than the original diameter of the rope.

Two ropes can be joined by a square or reef knot. It will hold tight and not jam unless with a small size rope.

One way to join two ropes.

splices, hitches and numerous kinds of knots. The illustrations are from an interesting little pamphlet issued by the Edward Christian Co. of Massillon, Ohio, on prospecting for coal, oil and other minerals by means of drilling. From this little work is taken also the description of the various knots, etc.

Any one can tie a knot, but to tie a knot that will not jam and can be easily and quickly untied is the secret of all knot tying. A great amount of rope and cordage is destroyed by not being properly tied.

In joining two ropes together it is necessary to have the rope as strong at the splice as any other

A very strong and serviceable splice can be made by unwinding one strand for several feet and laying the rope together, winding one strand into the rope as the other is unwound.

After it is in place, unwind the two remaining strands following the one which is wound in the opposite direction from the one first laid in.

Thus you have two strands laid in opposite directions and ready to tuck. This can be done by crossing one end over the other and tucking the end under the strand or by drawing the ends in a knot and tucking them under the strands as before; thus we have a

Another safe way to join two ropes is a plain bend or a double bend; this knot can be untied very easily and is stronger than any part of the rope.

A bowline is very useful where it is desirable to have a loop at the end of the rope that will not slip.

Another form of bowline which is sometimes used is made by taking the end of the rope through the opposite way.

The only safe slip knot is the running bowline, which will tighten and not bind the rope.

A safe knot is the bowline in the bight. It is a double bowline and makes a very strong hitch in the

middle of a rope. A good way to fasten a rope to a becket in a pulley or around a beam is two hitches, which can be strengthened by taking a round turn also. There is a difference of opinion in regard to tying these hitches, but either is very strong.

A good way to fasten a rope to a becket or hook, or where it is not necessary to remove it, is by a half splice, which makes a neat and strong way to securely

they are made.

A clove hitch will be found serviceable for holding the top of a post or beam in a perpendicular position. It will bear the strain on either side of the knot without slipping; thus a long rope can be used for two guy lines.

An effective hitch for hoisting or lowering timber in a mine is the timber hitch. This is simple, yet ef-

much rounded. A cat's paw is famous for its great strength. It is simply an endless rope, and is stronger than any other part of the rope. In the cut of the cat's paw the outer loop should be given one more half turn to the right.

Another strong timber hitch, which is very serviceable but rarely used, is the halliard bend. This knot will not slip under the most severe strain, making it

fasten the rope. By unwinding the rope for several turns and starting two strands through, bringing them out between different strands on the opposite side, you have the splice started, which is easy to complete, and, by trimming the ends, they can be tucked under the strands, making it tapered to the end.

There are a great many hitches that are useful and effective when used for the purpose for which

they are made. A backwall hitch is made by a twist of rope, which secures one object to another, and can be also safely made with a chain.

Another effective hitch can be made, which is more complex but useful, for a hook that is strained or is

reliable at all times.

A good way to fasten the end of a wire or manila rope to a hook, or at the top of a bailer, is to make a clove hitch and tie the loose end to the line. This also can be made stronger and more effective by putting in a half splice. It will wear a long time and will not draw tight.

A rolling hitch is very useful to fasten one rope to another where it is necessary to strengthen it.

A knot that is useful in tying two large ropes together is what is commonly called a Garrick bend. It is rather hard to tie, but strong, especially for hawser-laid rope.

When a rope is too long it can be shortened by putting a sheep shank in the rope.

A knot that is easy to tie, liable to slip and hard to untie is the granny. This knot is tied by people of all ages, has caused no end of trouble in trying to untie it, but still is universally used. It comes natural to tie this knot and to untie it—well, cut the rope, that is the best way out of it.

Knot making is a very useful hobby and a liberal education may be very useful. Every one should learn to tie at least the simple knots, so they may be easily untied.

# Mining and Metallurgical Patents.

PATENTS ISSUED AUGUST 2, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

LEVEL.—No. 765,858; D. Ricono, Fremantle, Western Australia, Australia.

In instrument described, dial having legs at right angles to one another, transverse piece on back of dial, transverse piece and bottom surfaces of legs being parallel to zero line of dial, index hand and plumb-bob box pivoted to dial, plumb-bob hung in box and visible through vertical opening therein, pins in legs and spring metal strip resting on pins and adapted to hold instrument to round body placed in angle between legs.

BELT CONVEYOR APPARATUS.—No. 766,040; J. B. Humphreys, New York, N. Y.

In combination in conveying apparatus, movable conveying belt framework, means for laterally moving and supporting framework, conveying belt mounted and actuated upon framework, and means for discharging material from belt, consisting of mechanism mounted upon framework and adjustable lengthwise of belt.

ORE PULP WASHER AND CONCENTRATOR.—No. 766,060; F. E. Parker, Kansas City, Mo.

The combination with receptacle for concentration of metals from ore pulp having valved discharge openings for waste material, of suspensory devices for receptacle, means for communicating oscillatory movement to receptacle and series of stud shafts located at limit of oscillation of receptacle in pairs, horizontal guide rollers on shafts, arms extending radially from side of receptacle and guide pins on arms contacting with rollers, and controlling curvilinear movement of arms, stationary pulp agitating

devices located above receptacle and extending downwardly with same and adapted to loosen material at discharge openings in receptacle.

ORE ROASTING AND OXIDIZING APPARATUS.—No. 766,156; L. H. Allen, Kansas City, Mo.

Apparatus for reducing ores comprising rotary ore retaining cylinder having flame conducting opening at forward end, reducing furnace, flame conducting cylinder leading from furnace within opening in cylinder, means for drawing off gases from cylinder and open water receptacle concentric with inner side of cylinder and located at forward end adapted for storage of liquid to be vaporized, and water pipe leading within flame conducting opening of cylinder and discharging downwardly within open water receptacle.

GOLD-SAVING APPARATUS.—No. 766,626; E. S. Kelley, St. Joseph, Mich.

In gold-saving apparatus, in combination, sluice box; bottom trough extending longitudinally thereof; amalgamating partitions in trough; mechanism, portion of which extends transversely of sluice box from side to side thereof and divides sluice box into plurality of compartments; means for actuating mechanism to positively move earth and water with comparative slowness through sluice box to prevent current in or agitation of fluid mass; and pocket having inlet opening in upper side near discharge from sluice box, into which inlet opening gold particles may fall by gravitation.

APPARATUS FOR LAYING OR SETTLING THE DUST OR PULVERIZED ROCK CREATED IN BORING OR BLASTING HOLES IN MINING.—No. 766,165; T. J. Britten, Witwatersrand Gold Fields, Transvaal.

In apparatus for use when blasting, bucket or water holder B, nozzle C comprising air and water supply branches, means for fixing nozzle at any desired angle or inclination, water supply pipe d' placing water branch c' of nozzle C in communication with bucket B, and air supply pipe f' placing air branch c of nozzle C in communication with air main F, air main F, air passage c' provided in air branch c formed flat at base and round at top and splayed

outward or formed with divergent walls at outlet orifice, valve c' for regulating quantity of air passing through air passage, water passage c' formed in water branch c' at angle to flat base of passage c', and elongated in direction of air passage c'.

DERRICK FRAME FOR SHAFT HOISTS.—No. 766,452; A. Klonne, Dortmund, Germany.

Derrick-like structure for shaft hoists, consisting of upright pillar pivoted on support at its base, pair of inclined struts pivoted to upper end of pillar, pulley journaled in structure above pivotal connection between pillar and struts, and hauling rope passing over pulley and depending centrally within pillar, pivots at upper and lower ends of pillar being located in axial line of pillar and in center line of load, and pillar being of skeleton open-work construction and of hollow rectangular form in cross-section to form a guide for load.

ROCK DRILL.—No. 766,564; F. L. Whitehead, Butte, Mont.

Rock drill comprising guide, carriage movable along guide, drill carrying tube movable in carriage, and means for imparting rotary motion to tube while moving back and forth, rotary motion being at all times in same direction, and means causing degree of rotary motion to increase with increasing length of drill strokes.

SAFETY APPLIANCE FOR ELEVATORS OR MINING CAGES.—No. 766,404; W. P. Ward, New York, N. Y.

Combination with elevator shaft, of car, or cage, bars arranged in shaft at opposite sides thereof and hinged at upper ends, and means for automatically causing lower ends of bars to converge toward one another, whenever the elevator car or cage moves faster than at normal speed.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

The United States Geological Survey has issued reports on the production in the United States during the year 1903 of petroleum, asphaltum and bituminous rock. The petroleum production was 100,461,337 barrels, valued at \$94,694,050, against 88,766,916 barrels, valued at \$71,178,910 in 1902.—Production in California increased by 10,000,000 barrels, while the Texas production decreased 1,000,000 barrels.—The production of asphaltum and bituminous rock was 101,255 tons, valued at \$1,005,466. This was a smaller amount by more than 4000 tons in quantity than the previous year, but its value was 31% greater. Of the total production 45,187 tons, valued at \$522,164, came from California.

## ALASKA.

J. E. Ballaine of Seattle, Wash., president of the Tanana Construction Co., which is building the Alaska Central railroad, reports work on the Alaska Central is progressing rapidly. Twelve miles are completed and in operation, and they expect to have 21 miles in operation by September 1. He counts on having not less than 40 miles of grading finished and ready for the rails before winter. He will push construction through to the Tanana river, summer and winter, and complete the whole road within three years. The road will be 500 miles long. One hundred and thirty-five miles inland from the coast terminus at Seward, the road will tap the coal fields, says Ballaine. The seams on Chicooloon creek, as exposed in the bluffs, measure a total of 264 feet. The road also opens the placer gold districts of interior Alaska, and will have copper properties in three districts. The northern terminus is the Tanana gold fields. The southern harbor is open every day in winter and has good terminal facilities.

Discovery of placer gold is reported on the beach at the fishing port of Sand Point. All available claims are said to be staked out, and the owners are offering \$10 a day for men to work the ground.

## ARIZONA.

### Cochise County.

(Special Correspondence).—There is considerable activity in the Tungsten, near Dragoon. G. Borricke, of the Primos Chemical Co. of Primos, Pa., is working the company's properties and making regular shipments of hubnerite to their works at Primos. A New York firm is operating on some leased claims and working about thirty men. J. D. Burgess, of Tucson, is manager.—T. Clemens is working several men and reports satisfactory results from his placer claims. G. S. Mulkey is working his quartz claims and expects to put in a concentrating plant when he has ore enough blocked out.

The copper camp at Johnson has been inactive for some time. It is reported that the Mammoth and Republic mines will start up this month with a full number of men. Those mines are said to contain large bodies of payable ore in sight.—A. H. Wien reports a deal under way on his Copper Chief group. It is said the Calumet & Arizona company has options on H. S. Wien's property.—It is reported that Eastern people are negotiating for a bond on the Cochise Co. Co. properties.—The Peabody mine was flooded by the recent heavy rains. The extent of the damage is not known.

The Old Terrible M. Co. is sinking a new shaft on its property near Manzoro. H. E. Armitage is manager. Dragoon, Aug. 8.

The San Bernardino M. & M. Co. is arranging for machinery at its property, which is 10 miles east of Douglas and near the international line.

### Cocino County.

At the Eclipse shaft of the Anita C. Co., 3 miles from Anita Junction, near Williams, Superintendent W. H. Hill says sinking is progressing with four six-hour shifts operating two machine drills. During twenty days ended August 6, 89 feet were sunk below the old workings, making the depth 353 feet. At 250-foot level a drift has been run in 40 feet. The shaft is three compartments, 5x10 feet in the clear. Heavy sets of timbers are being put in as the work is progressing. T. C. Woodworth, consulting engineer, says they have struck the first contact expected at the 300-foot level, comprising quartzite porphyry. The last 30 feet of sinking is reported showing mineralization and some copper stain. The hoisting plant is equipped to go to depth of 2000 feet. A 10x14 inch geared steam hoist is used, and 2-inch steel cable. A 2½-ton bucket is in use, but later a 2½-ton skip will be

put in the shaft. The air compressor has a capacity for eight drills. Condensing apparatus is connected with the boiler plant. A telephone line will be put up from the mine to Williams.

### Gila County.

The Old Dominion C. M. & S. Co.'s old smelting plant was partially wrecked by the explosion of furnace No. 2. Fortunately, none of the men working about the furnace at the time were seriously hurt. C. F. Shelby, smelter superintendent, in explanation of the accident, says that one of the north side jackets sprung a leak on the lower flange, near the center of the furnace. The furnace was about to be shut down as a precautionary measure, when a rush of molten matte into the water space of the jacket resulted in an explosion which completely demolished the furnace. The force of the explosion was upward, and sections of the feed floor and roof for about a 10-foot radius were cut out and carried upward with the wreckage of the furnace, falling again to the ground floor. Streams of water were played on the burning debris and the flames quenched. No. 3 furnace, which was slightly damaged by the explosion, has been repaired and blown in. No. 1 furnace had to be shut down because the blowing away of the feed floor completely cut off access to it. Repairs have been made. There were three Mexicans at the furnace on the feed floor, who were blown into the air and came down without sustaining any injury beyond a few scratches.

### Graham County.

Owing to dry weather which recently prevailed in the section, Manager Stevens of the Stevens C. Co., near Clifton, granted permission to the Arizona C. Co. to use water from the main shaft of the Stevens Co., and it has been determined that a regular flow of seventy-five gallons a minute can be had from the shaft. The Cuprite Co., which is located still higher than the Stevens Co., is also developing a considerable amount of water, and it is thought the company will have water sufficient to treat its ores at the mines. The Polaris Co. has also developed water in its workings, and the management expects an abundance of water will be furnished by the mines to run a concentrating plant.

The output of the Arizona C. Co. for July was 1391 short tons of blister copper, as against 1148 tons for the previous month, reports the Clifton-Morenci Mining Bureau. The results for the half year to March 31 are said to show profits, including \$72,085 brought forward from September 30, 1903, of \$793,363. The Arizona C. Co. is continually making improvements at its plants and mines.

### Mohave County.

A discovery of molybdenum ore is reported made 2 miles north of the Berkeley mine, in Cedar district, near Kingman. The veins are large, one being 20 feet in width. The surface ores carry values in copper, but at the canyon level the copper disappears and molybdenum values come in. The mines are owned by E. S. Osborne, H. W. Kemper, Smith & Sawyer, L. J. Lassell and W. J. Connor. A road can be built from the main Cedar road to the mines at small expense.

### Santa Cruz County.

The Joplin group of mines in the Tyndal mining district, Santa Rita mountains, near Nogales, has been sold to E. C. Mallette, manager of the Springfield-Arizona M. Co., of Springfield, Mass. The company has a working bond on the Joplin group for \$20,000. By the terms of the contract the operating company must do at least 100 feet of development work during each month. Operations will start this week.

## CALIFORNIA.

### Amador County.

At Defender the sinking of the shaft of the Defender mine 60 feet deeper, making 350 feet in all, has been completed. A drift has been run north and has cut a 7-foot ledge of quartz. It is expected that the mill, which has been idle for sixty days on account of sinking, will be started up by Sept. 1st on this ore.

The Fremont mine, near Amador City, is reported running smoothly on the "open shop" basis. The number of employees is being increased as the mine is getting into full working order. Twenty of the sixty stamps are dropping. The men are boarded and housed on the grounds.—The Climax mine, east of Jackson, is operating its 2-stamp mill on payable ore.

### Butte County.

Preparations are being made for machinery for a mining dredger by the Cranston Co. on the O'Brien land, on the south side of the Yuba river, near Oroville. Construction will start by Sept. 1st.

### Calaveras County.

President Miller of the San Andreas Gold Channel M. Co. reports that the mill for the Chris Anderson mine, near San

Andreas, is on the ground. It will be put in place and is expected to be started working on the gravel of the mine by Sept. 1st.

Manager G. I. Wright of the Del Monte mine at Railroad Flat reports that the 10-stamp mill of the company was destroyed by fire last week. The fire is supposed to have caught from a spark from the furnace. Nothing could be saved. The loss is estimated at \$5000, insurance \$1900. This is a serious setback at this time. The company was prospecting the ledge struck in the lower tunnel with encouraging results. Efforts will be made to build a mill at once. The company's main office is at Jackson, Amador county.

The Mountain King G. Co. of Los Angeles reports running its mill near Murphys on good rock. Progress is being made. E. Delray is superintendent. A mill is being built at the Hercules-Horsehoe mine and is expected to be ready to run this month.—W. L. Driver, in charge of the Cordelia (or Ohio) property, is taking out ore.—It is stated G. F. Stone will proceed with development work at the Red Gold mine, also near Murphys.

### El Dorado County.

C. H. Duntun, superintendent of the Eureka slate quarry at Kelsey, reports roofing slate is being shipped from the quarry. Large shipments are being made to Seattle and Fort Flagler, Wash., and to Oakland and San Francisco, Cal.

Preparations are being made for extensive development work at the Red Raven (formerly the Uncle Sam) group of mines, 2 miles north of Shingle Springs. Buildings have been put up and the work of laying a line of 11-inch pipe from the Crawford ditch to the mine will be started this week. It will be ½ mile in length. The water will be used on the south for power purpose in operating a hoist and mill and also on the north end of the tract of land for sluicing for the gold contained in the surface dirt. The property is owned by the Red Raven M. Co., having its principal place of business in Los Angeles.

At the Darling gold quartz mine, near Georgetown, the work of putting in an electric plant at the mine is progressing. The hoist and mill will be operated by electric motors with alternating current. Development work is progressing in the mine.

### Humboldt County.

It is reported B. Lucas of Fortuna, with Eureka men, is preparing to develop a group of mines in Willow creek section and that a stamp mill will be built.

### Inyo County.

Work will begin again on the Kearsarge mine, near Independence. Negotiations have been concluded by which T. T. Murray of Detroit, Mich., gets a bond on the property for three \$10,000 payments to be made August 15th, October 15th and December 15th. The first work will be a 1200-foot tunnel to cut the ledges at right angles at least 400 feet below the deepest of the old workings. A factor in this will be the installation of an electric plant in the canyon to the eastward, for generation of power.

### Nevada County.

(Special Correspondence).—Mining operations around You Bet are almost at a standstill, due to the restriction placed on hydraulic mining. J. S. Goodwin has ten men at work cleaning to bedrock on Greenhorn creek. This pays from 25 cents to \$20 to the pan and gives fine gold. You Bet, Aug. 8.

W. Ochs et al. of Salt Lake City, Utah, have bonded a group of quartz mining claims 3 miles east of Washington and in the same belt as the California, Grey Eagle, Yuba and Eagle Bird properties. A mill will be built.

The Ironclad mine at Rough and Ready is again in operation since the pump was repaired. The company is planning to build a 10-stamp mill. A 2-stamp prospecting mill has been in operation since the mine started.

At the Lecompton mine, near Nevada City, the main shaft is to be sunk from its present depth of 400 feet to 1000 feet. Other extensive improvements will be made, says Superintendent W. H. Dunlap. While sinking the shaft is in progress, other work will be discontinued temporarily.

The Red Hill, Ltd., Co. of Glasgow, Scotland, has conveyed back to H. L. Trevasakis the forty-eight acres of patented quartz mining land on Red hill, 2 miles west of Nevada City, where the company operated. A company will be organized and development increased.

The Brunswick mine at Grass Valley is expected to be on a producing footing again this fall. The mine has been unwatered and both the hydraulic and electric pumps are kept going to drain the mine thoroughly. The pumping plant represents an outlay of \$30,000. What little prospecting has been done since the

lower workings of the mine have been made accessible is satisfactory, says C. R. Mallen. The shoot that is being run for is the "Mill" shoot. Ore is being drifted on that assays \$12 in gold, mostly free milling. The number of men at work is being increased, and it is expected the stamps will begin dropping next month.

The Orleans M. Co. has bought from the Sebastopol M. Co. the latter's claim adjoining the Orleans mine, near Nevada City, for a cash consideration. There are thirty-five men employed at the Orleans and work is progressing. The five stamps are dropping on payable ore.

### Placer County.

Superintendent J. B. Patterson says that at his mine they are driving the tunnel, lack of water causing the mill to shut down. There is payable gravel in sight.

The company having a bond on the Big Pine or Bouk mine, below Auburn, has let a contract to sink 100 feet. There is a shaft down 180 feet. It is proposed to drift after the present contract is completed, and then, if the outlook justifies, a mill will be put up. G. Foster is in charge.—The Gaylord mine, near Auburn, is running its mill steadily and will continue as long as they can get water. Besides taking out gravel, they are also making a crosscut for air.

### Plumas County.

Work is in progress at the Five Bears mine in Genesee valley, near Genesee. The property is equipped with a 10-stamp mill, in which the ore will be crushed through 20-mesh, after which the product will pass to a Kinkead mill and there be reduced to slimes, after which it will be elevated by a sand pump into the agitating tanks of the cyanide plant. The cyanide plant of sixty tons capacity is well under way, the tanks having been placed and most of the buildings completed. The cyanide solution and the pulp will be agitated and the values precipitated by electricity upon cathodes, instead of in zinc boxes. For work in winter months the plant will be heated by steam coils being placed in the cyanide tanks, at the jets, all valve openings and at the Pelton wheel. In the mine there is a good reserve of milling ore, which will permit of crushing to begin September 1st. The ledge is 5 to 11 feet wide. Rails have been laid in both tunnels.

Superintendent Goodhue, at Iron Bar, near Quincy, says his company, the Feather River Con., has started the cement gravel mill. For some weeks past twenty men have been at work opening up the ditch filled by the floods last winter. The excavation is 6 feet wide, 3 feet deep and 1400 feet long. The upper end of the ditch is cut 2 feet lower than the old one, avoiding the necessity of a dam across the stream to fill it. In the fall this will be covered over so as to prevent the winter floods from destroying the ditch. The work of mining the cemented gravel deposit at Iron Bar will continue with two shifts. The company will put in a black sand mill to treat the 1500 pounds of black sands saved daily by the cement crusher. The average value of these sands is said to be \$140 per ton.

### San Bernardino County.

(Special Correspondence).—Silver Mountain mining district, of which Victorville is the railroad center, is improving and will become a gold and copper producer, as recent discoveries of gold lodes with promising developments underground are being made. The Fearnot M. Co. has reached a depth of 500 feet, showing a well defined gold-bearing lode to that depth, carrying iron-copper sulphides in white quartz having gold values of \$10 to \$20 per ton. This company owns twelve gold claims. A larger reduction plant will be put in this fall.—The Greenback gold lode, near the Fearnot Co., is opened 200 feet deep with the new shaft and contains lead, copper, silver and gold values.

The Copper Mountain Co., on the east side of Silver Mountain, has several hundred feet of shafts down in veins of copper ore. Several crosscuts show heavy copper veins exceeding 20 feet in width. Character of ore is chalcocite in gangue of magnetite, with values of 5% copper and \$7 per ton in silver and gold. A tunnel is being driven to cut the lode 400 feet deep.

The Copper Chief group, near the Side-winder mine, has a 40-foot free-milling gold ledge with payable values and considerable tunnel work is done toward its development.

The El Dorado-Bonanza, Copper Prince and Bimetallic copper-silver veins in West camp are being sold, says Manager C. F. Blackburn. This group of copper lodes affords a promising surface showing. About 300 feet of shafts show ore with values ranging from \$7 to \$40 per ton in copper, silver and gold. These lodes show mineral croppings between mica-schist and gneiss foot wall and limestone hanging wall. A group of zinc and gold claims and the 100-foot free-milling Mammoth

siliceous gold lode, on which seven claims are held by C. F. Blackburn, will be incorporated and developed.

The variegated marble quarries near Victorville are being patented and will be extensively worked.

The Exploration & Securities Co. of Boston, Mass., W. B. Guild president, owns gold-bearing veins near Victorville. The Mojave river, flowing through the district, affords a reliable supply of snow-derived water from the north slope of the San Bernardino range.

Victorville, Aug. 9.

#### Santa Clara County.

The transfer of the magnesite properties at Red Mountain, south of Livermore, Alameda county, to the American Magnesite Co. of Oakland, which was recorded last month, has resulted in four corporations which are to handle the product of the mines. The United States Steel Corporation is interested in the magnesite proposition through Rubins, Dupey & Fisher of Chicago, Ill. The American Magnesite Co. is to control the raw product of the mines, but the manufacturing enterprises are to be handled by three subsidiary companies. The Magnesite Co. is headed by G. W. French of Chicago, Ill., as president, and H. C. Stilwell of Fruitvale, Cal., as vice-president. Charles H. Spinks of Berkeley is manager and E. L. Richmond superintendent of the mines at Red Mountain. Each of the three subsidiary companies plans to build a factory on tide water in Oakland. The magnesite will be used in the manufacture of firebrick for furnaces of locomotives and other boilers. It is to be manufactured by the Rose Brick Co., headed by J. V. Rose, which will build a plant capable of turning out 100,000 bricks per day. As a by-product a large amount of carbonic acid gas is given off in the reduction of magnesite ore. To handle this the American Carbonic Acid Gas Co. has been formed, of which J. Deere of Moline, Ill., is president and G. A. Wyman manager. A patent brick is to be manufactured from magnesite ore by the Pylastic Construction Co. E. D. Weary of Chicago, Ill., is president and manager and P. B. Jagger of London, England, is vice-president. The Magnesite Co. plans to build a road from the mines on Red Mountain to the Alameda county line, to connect with the county road being built up the Arroyo Mocho from Livermore.

#### Sierra County.

W. C. Oakes has bonded the Dolly Varden quartz mine in Jim Crow canyon, near Downieville, and started operations on the ledge. A tunnel to tap the shaft where a pocket was found is about half completed. Oakes intends putting in machinery to pump out the water and prospect from the shaft.

#### Siskiyou County.

The Pacific States M. Co., J. W. Martin, superintendent, 2 miles from Noltan, will this month finish their flume which is to convey bank water to its new diggings, and has started work on the upper flume to furnish water (a 300-foot head) for the giant. Water is taken out of Fort Gough creek. Mining is progressing in the Classic Hill mine at Happy Camp, worked by Manager Mullins for a Los Angeles company, with J. Wood, superintendent of mining operations and of the work of enlarging the ditch. Three miles of road building is progressing. The company is also putting up a saw mill for the lumber and timber needed.

The Mount Vernon group of quartz ledges at summit of divide between Greenhorn and Cherry creeks, near the stage road, near Yreka, is being worked under Superintendent McLean. The company has built a road around the hill to the mines and has had a survey made towards securing a patent, with intention of putting up a mill on further development.

The San Francisco company of Gresswell & Harvey are working the Mott placer mine at Oak Bar with twenty-four men and expect to reach bedrock by Aug. 20. Mott is superintendent, with P. Mott assistant. The Oak Bar hydraulic mine, under H. J. Barton, closed down for the season on the 26th ult., owing to the water supply becoming short, but will resume operations Nov. 1. The Espey Hydraulic M. Co., at Beaver creek, is still worked. E. J. Harris, who owns a rich quartz mine on Russian creek, Salmon mountain, between Etna and Sawyer's Bar, are building a branch road to the mine and also putting up a quartz mill.

#### Tahtumne County.

From a depth of 1420 feet the shaft of the Dutch mine, at Quartz, will be sunk 150 feet, when drifts and crosscuts will be run. The Eagle-Shawmut Co. has bought the Woods Creek placer, consisting of sixty acres, near their mines and mill, south of Chinese.

W. B. Elkins of Buena Vista, Chaffee county, Colo., has a bond for a deed to the Rainbow, Iron Cross and Mountain

Key quartz mines, a millsite of five acres and 200 inches of the waters of south fork of the Stanislaus river near Columbia for \$25,000. W. Vaughn of Columbia is interested. Operations have been resumed at the Horse Shoe Bend mine, the damage resulting from the recent forest fire having been repaired.

A forest fire in Seminole gulch, south of Carters, last week destroyed the 10-stamp mill at the Mayflower mine, the loss being \$2500. The mine was closed down.

The Vine Springs mine, near Columbia, has ceased operations temporarily. Several days will be required to mill the ore on the dump and then the stamps will be hung up. A. F. de Souza has bought the Reservoir placer mine, consisting of fifty-five acres, 1 mile north of Columbia.

D. Bottini has bought the Gem (formerly the Monitor) quartz claim, 4 miles east of Confidence, near the Mt. Vernon and Excelsior mines.

D. Peri has bought the Santa Maria quartz mine, in Moccasin Creek district, 1½ mile northeast of Hughes station, near Big Oak Flat, near the Monte Cristo mine.

C. H. Carter has an interest in the Worcester and a one-third interest in the Esmeralda and East Esmeralda quartz claims, 1 mile east of Carters. T. A. Piper has a bond for a deed to the Buckeye placer mining claim and other land and mining rights near Columbia for \$20,000, to be paid in three years, 20% of the gross yield to be applied on price.

#### Yuba County.

The dredger of W. P. Hammon & Co. has been put to work, near Marysville, and the second one will be completed this week. Both are in the same pond and will work in conjunction. A hole, 15 feet deep, has been dug by the first dredger and the buckets come up filled with fine gravel. It will be several days before the best pay dirt will be reached, as it is about 50 feet from the surface to bedrock. Electric power is used. The Yuba River M. & Dev. Co., owning the two dredgers near Yuba river, east of Marysville, has established offices at Marysville, says Manager L. P. Moore.

Last week the machinery of a gold mining dredger completed on the Hallett place, 5 miles below Smartsville, began digging for gold in the deposits adjacent to the channel of the Yuba river. These boats are each 265 feet in length, and the cost of each is about \$100,000. The main ladder at the forward end of the structure is 100 feet in length and will permit the buckets to dig to depth of 60 feet. The buckets will hold 6 cubic feet. Twenty buckets can be dumped in one minute, an average to each boat of about 6480 cubic yards in a run of twenty-four hours. Electric power is used to operate the boats and there are eight motors to each of them. The main motor that moves the machinery that operates the buckets is 100 H. P., two of 50 H. P., two of 20 H. P. and others less, the total being 279 H. P. When in running order eight men comprise a shift on each dredge, and they will work eight-hour shifts. The boats stand about 45 feet above the water.

### COLORADO.

#### Chaffee County.

The Buena Vista M. Co. is working at Hancock, near Buena Vista. The company will build boarding house, tunnel house, power house and ore bins on the line of the C. & S. Railroad, with a capacity of 100 tons. A plant of machinery will be placed in position as soon as the buildings are under way. The tunnel will cut the Dave Knox vein at a depth of 500 feet by running a distance of 700 feet. It is in 150 feet and has cut three blind leads. The company's property consists of the Dave group of thirteen claims on Mt. Chapman. The C. & S. railroad has a switch on the ground. The tunnel will cut the Dan Clark vein by driving about 10 feet farther. This vein is 4 feet wide between granite walls and assays 40.

#### Clear Creek County.

The J. D. Williamson I. Co. of Idaho Springs has bought six claims in the Daily district and has put men to work placing material on the ground. The property is on south branch of Clear creek. It is intended by Manager Williamson to drive a tunnel through the mountain for developing the new mining field. A tunnel site has been located, as well as a mill site. E. M. Moscript of Idaho Springs is also interested in that section, and it is his intention to put men on this week. Moscript is also manager of the Butler M. Co., which is putting in a plant of machinery.

The air compressor at the Burleigh tunnel of the Pelican-Dives M. Co. was shut down a few days last week for erecting the smokestack, making repairs to the boiler and putting the machinery in shape, as it is intended, says Manager Eaton, to increase work in the crosscut being driven to connect with the Seven-

Thirty shaft, which will afford ventilation for a large part of the property and enable concentrating material from the Seven-Thirty workings to be brought out to the mill through the tunnel. An attempt was made to use the Pay Rock compressor to supplement the power required for the operation of the company, but as it was necessary to force the air through 3 miles of pipe it was found impracticable to utilize the Pay Rock plant, due to loss by friction. A more powerful plant of machinery for furnishing power will be put in by the company. E. Steffan of Central City is superintendent of the mining operations of the company, Superintendent Reynolds being retained in charge of the engineering and milling work. The local office of the company has been removed from Georgetown to Silver Plume.

Work has been started on the Double Header group, says G. Albertson of Denver, manager of the McClellan Mountain G. & S. M. & M. Co., near Silver Plume. Men have been put to work driving the tunnel which is projected to cut the lodes at greater depth. Last summer the company started driving the tunnel. The property is near that of the Southern M. M. & D. Co.

Manager E. J. Wilcox of the Waldorf Co. has arranged for electric power for operating the Stevens mill, near Silver Plume, and the work of putting up the poles for carrying wires was started last week. Wilcox will drive the Stevens tunnel through the mountain to connect with the Wilcox tunnel being driven from the East Argentine side, where the company has large holdings, as that would give communication between the different properties and afford a means of transporting all ores to the Stevens side where the low-grade ores can be treated at the mill, and it is also a shipping point for the smelting ore which the company has blocked out. The electric line being put in will also afford power for driving the tunnel and can also be used in transporting ores through the tunnel after it is completed. The mill is running steadily and treating fifty tons of material daily from the old stops of the mine, and as soon as the addition to the mill is completed and more machinery set up its capacity will be increased.

#### Custer County.

The Bassick mine at Querida is practically all leased out in blocks from the 1700-foot level, says the Post. The lessees are shipping to Pueblo a good deal of the high-grade black telluride ore and returns on carload lots show an average value of \$100 per ton, of which 60% is in gold. Until the new mill is built on the Bassick mine the company will do nothing in the way of development and will continue to lease out the ground in blocks. A. G. Bassick of Bridgeport, Conn., says the company will experiment to decide what process is needed to handle the bodies of low-grade ore in the mine and then put up a mill.

#### Dolores County.

Superintendent Hooper of the Group Tunnel mill, near Rico, says the pipe for the power plant is laid. The machinery at the mill has been overhauled and is in readiness to start as soon as power is at hand. The San Juan Ore Co. is breaking and hoisting ore at the Argentine mine, near Rico, and is increasing its force of miners. J. Muncester is foreman. At the Pro Patria tunnel the work of catching up caves and retimbering is progressing. A. G. Ellis, recently of Lake City, will have charge of the mill.

#### Gilpin County.

W. Mitchell & Sons have resumed operations after a delay of several weeks, during which time they have put in heavier plant of machinery and erected a shaft building on their Gulch mine in Lake district, near Central City. The plant consists of a 50 H. P. hoist and 70 H. P. boiler. The main shaft is down 235 feet and it is intended to sink at least 100 feet more. The shaft showed a smelting streak which carried gold and copper values. Some drifting work has been carried out. Smelting ores have been shipped running \$150 per ton, while fair grade milling ores have also been shipped.

During month of July the Roderick Dhu M. Co., operating on the Patch on Quartz hill, near Central City, shipped by wagon to the New York mill at Black Hawk 215 cords of ore, or over 1800 tons. Manager J. C. Fleschutz reports the ores averaged 2½ ounces gold per cord and that the tailings ran \$22 per ton. Seven cars of the product were shipped during the month to the Denver smelters.

The Newfoundland G. & S. M. Co. has been incorporated to operate on the Newfoundland group of mines on Gunnell hill, near Central City, the management of which will be under G. W. Mabee. During recent sinking operations the shaft showed a vein from which they took out ores of a concentrating character, and as

soon as sinking operations are resumed they will take out more ore and make a shipment of 100 tons to the Rocky Mountain concentrator in Black Hawk. Another bin is being built for storing ores until they get a sufficient quantity to make a shipment. As soon as sinking operations are completed and more ground is opened up the number of men at work will be increased.

#### Gunnison County.

The Sylvanite mine at Gothic is producing a large tonnage of low-grade ore for the Gothic smelter, which is expected to blow in this month. The smelter was constructed last fall by Illinois men.

#### Jefferson County.

The gold dredger Eleanor No. 3, of the National Dredging Co., was launched at Eleanor, 6 miles east of Golden, last week. The other dredger, Eleanor No. 2, being built at the nearby (Placer) station by the Gold Creek Dredging Co., will be launched this week. Machinery for both dredgers is on the ground and will be set up. The work of dredging for gold will begin October 1. H. J. Reiling, of Denver, is president of the National and Clear Creek Dredging companies, and says their investment represents \$500,000. The companies own 650 acres of flat land, beginning 3 miles east of Golden, and extending down Clear creek toward Denver. The boats are 110 feet long and 58 feet wide. Each will carry 300,000 pounds of machinery and each is capable of handling 3000 cubic feet of gravel per twenty-four hours. Arrangements have been made with the Denver G. & E. Co. for electric power.

#### Lake County.

Leadville reports say that, notwithstanding the depressing effect of the iron market, the shipment of ore from the mines of Leadville district were well sustained during the month of July. A large tonnage of iron is shipped daily from the district under normal conditions. Leadville produces a high grade of iron ore, which is in demand at both the smelters and the iron and steel mills of the West. The production of ore of all kinds from Leadville mines during July is estimated at 70,000 tons. The Moyer mine and other properties of the Iron Silver M. Co. heads the list with a tonnage of 12,000. The Yak, the Fryer Hill M. Co., the Ibox Co. and lessees, the New Monarch, Ollie Reed and other properties in Evans and South Evans gulches, the Rock hill properties, the A. Y. & Minnie mine and mill, the downtown mines and small properties in all parts of the district have maintained their average shipments during the month. From the figures obtained from American S. & R. Co., the various producers of ore and the railroads which haul the ore out of the camp, the estimate of 70,000 tons for the entire district is obtained.

The Coronado mine at Leadville is down 100 feet below the former level of the shaft and is being sunk through the parting quartzite. A drift has been started from the shaft for tapping the water course which was struck in the Penrose, and which caused a suspension of sinking in that shaft. It is expected that the water can be controlled so that the sinking of both shafts can be carried on without further delay. It is expected that breaking of ore in the Coronado will be resumed next week. The lessees on the Ibox properties are meeting with success, says Manager J. F. Campion of the Ibox Co. The lessees, says Campion, are shipping 1500 tons of good grade ore a month. In addition to the shipments, the lessees are carrying on extensive development. The Best Friend tunnel, at the head of Evans gulch, is improving. A body of ore has been struck in the raise which was started from the tunnel to connect with the Best Friend shaft. The ore carries 300 ounces silver and \$20 gold per ton.

#### San Juan County.

The Bear Mountain M. Co., operating a group of claims on Bear mountain, near Silverton, resumed work on its properties last week. The completion of a crosscut, which will tap the main lead of the group at 200 feet below surface, is the principal object of the company, as it is expected the ore shoot of the upper workings will be opened by the crosscut. High-grade shipping ore was marketed from that shoot.

The Gold King Con. M. Co., near Silverton, has put carriage of ores from mine to mill in operation, the entire output from both mines being conveyed to the mill over the American tram. Between every two buckets on the line an extra bucket has been added, rendering the capacity of the line equal to all emergencies. The mill is running under full headway, the daily shipments in concentrates aggregating seventy-five tons, says the Silverton Standard.

#### Summit County.

The Hoosier Gulch G. M. Co., owner of

the Bemrose placer, at base of Hoosier pass, near Breckenridge, on which there are several promising lodes, is sinking a shaft. T. A. Brown is superintending the sinking. In the meantime, placering continues on other portions of the company's holdings.

Breckenridge reports say the Senator M. & M. Co., which is driving a tunnel to develop a group of lode claims on North Star mountain, has put in a compressor and air drills which are to be used to drive the main working tunnel 600 feet additional. The ore opened in the upper tunnels is pyrite running well in gold and silver. The new tunnel will open the property at practically the Blue creek level.

The foundation for the twenty 800-pound stamps that are to be added to the present 20-stamp and concentration mill of the Cashier group of gold claims in Brown's Gulch, near Breckenridge, is completed.

#### Teller County.

Hemby & Co., who are leasing on the north end of the Ramona claim on Bull hill, at Victor, in driving north in the 200-foot level, have opened a shoot of ore that assays \$40. They are breaking fifteen tons of rock a day in that level, which goes \$25 to the ton. Hynes & Co., on the south end of the claim, have started sinking at the depth of 120 feet for additional stoping ground, as the territory above has been practically exhausted of ore. They have put in a plant of machinery. The ore shoot being worked on the Ramona has been proved for 500 feet.

#### IDAHO.

##### Blaine County.

The Quincy Junior M. Co., that bought the Red Elephant group of claims near Bullion, near Hailey, for \$75,000, has made third payment of \$16,000. The company's concentrator has been overhauled and made ready to go into operation this month. There is a body of 2 feet of galena and concentrating ore opening in the mine, with 500 feet of backs, and another body of 6 inches of solid galena has been cut into in the deepest workings.

The output of the Minnie Moore mine, near Hailey, last month exceeded \$150,000, says the Wood River Times.

##### Boise County.

In the Mammoth mine, on Summit flat, near Idaho City, twenty-seven men are employed in and around the mine and fifteen in the timber. Five teams are hauling wood. A 2-foot vein of ore has been struck on the 200-foot level. Two ledges were worked on the 100-foot level and this is thought to be one of them. A drift has been run 15 feet on the vein. The mill of eight stamps will be started this month. Men will be put to work stoping, and the incline on the ledge, down 300 feet, will be sunk 100 feet deeper.

##### Canyon County.

The South Lincoln G. M. Co., Ltd., has been incorporated by J. H. and J. A. Stallings and A. J. Weber of Salt Lake City, Utah, L. A. Wagner and R. D. McDougal of Pearl, Idaho. Its property consists of mining claims in Canyon county. J. H. Stallings is president and manager.

##### Custer County.

F. L. Fearn, manager of the White Knob C. Co. of Mackay, says the smelter is in steady operation, treating 450 tons of ore per day for the company, in addition to 100 tons per day for other parties. The ore averages 3% copper and \$1.50 in gold and silver. Approximately 400,000 pounds of copper is being produced per month. The product turned out from the smelter is only 50% pure, which is shipped to the Atlantic coast for final treatment. Fearn is preparing plans for a converter which will treat the ore after it comes from the smelter. The converter will cost about \$80,000, and it is expected to have it in operation by January 1st. The capacity of the smelter is to be increased by addition of another furnace. The two now in use are not sufficient to handle the ore as fast as it is being taken out. Regarding the strike made in the mine last month, Fearn says the ore is well developed and carries an average of 5% copper. They are breaking a strip 25 feet wide in this body.

##### Shoshone County.

Preparations are being made to continue the Hecla shaft at Burke from the 600-foot level to 900 feet. For this work an electric hoist and an electric sinking pump will be put in at the 600-foot station, says Superintendent McCarthy. Electricity is the exclusive power at the Hecla mine.

Machinery is on the ground for another 500 H. P. compressor to be installed in the Morning mine, owned by T. L. Greenough and P. Larson of Spokane, Wash. The mine is at the mouth of Grouse gulch at Mullan. The drill will be

operated by electric power from Spokane falls, and the power line is being built into the mine. The Washington Water Power Co. furnishes the electric power at the rate of \$50 a year per horse power. The contract calls for a minimum of 300 H. P. all the time.

The King Solomon M. Co. has been incorporated with principal place of business at Wallace. The directors are N. Wittner, J. W. Flink, J. H. Nordquist, G. Champagne of Wallace and O. E. Redlin of Gem. The property of the company is on Canyon creek and adjoins the Formosa, owned by Finch & Campbell.

Work on construction of the Washington Water Power Co. electric line to the Morning mine at Mullan is under way. Men are clearing the right of way, and poles are being strung. The wire leaves the main line on Canyon creek, 2 miles above Wallace.

#### MONTANA.

##### Beaverhead County.

At the Indian Queen mine, near Dillon, another vein of ore, 12 feet wide, has been opened up, which runs 6% copper the entire width of the vein. The ore of the Queen is said to be self-fluxing. The company will sink a double-compartment shaft 500 feet in the granite outside of the tunnel, and put in a stronger hoist. A steam engine is now used for all power, but this will be replaced with water power. A ditch 1500 feet long is going to be run from Birch creek, which will give a fall of 30 feet. By the present method it costs about \$2.50 per ton to handle the ore. The new shaft will also open up the sulphide ores. About sixty men are worked by the Indian Queen Co., and three shifts a day are run at the smelter and two shifts a day at the mine, each shift being eight hours. G. A. Heberlein is superintendent of the mine and smelter. The Indian Queen M. & S. Co. also owns the Bridge Gulch and the Beaverhead claim, which is an extension of the Indian Queen.

##### Fergus County.

The Maginnis properties will be put in operation again after an idleness of twelve years. A deal has been closed whereby E. H. Crabtree of Lewiston will have charge of the works, and operations will begin next week on both the Maginnis and the Globe mines near Maiden. The properties are owned by the Conrad-Stanford Co. of Great Falls and Helena, and E. H. Crabtree has bonded them for two years for \$60,000. A royalty of 20% on all profits is to be paid to the Conrad-Stanford Co. to apply on the price. Both mines will be opened and work will be started in sinking a new 300-foot shaft below the old one in the Maginnis mine. Ore bodies will also be opened up below the old tunnel level. Shipping ore will be taken out from the Maginnis while the Globe mine is getting started. The Globe mine is free milling ore, while the Maginnis is 60% free milling and the rest amenable to cyanide. There is a 10-stamp mill on the ground, which will be repaired and put in operation. The contract calls for a minimum monthly expenditure of \$1000 per month. Twelve men will be put to work to begin with and more will be added as the work progresses.

#### NEVADA.

##### Esmeralda County.

The shaft on the Combination mine at Goldfield is down 290 feet and another level will be run. The value of ore raised daily is from \$3000 to \$7000. Work on the reduction plant will begin this week.

The Spokane M. Co. has been incorporated to operate four claims—Spokane Nos. 1, 2, 3 and 4—which are south of the two Daisy mines at Goldfield. At a depth of 14 feet assays showed a value on a 4-foot ledge of \$40. The work of developing will be increased, the sinking of a shaft having been begun. J. E. Blake is president, with M. M. Ogden and W. C. Parks as officers, and A. B. Acorn of Tonopah, superintendent.

The Vernal group of claims at Goldfield have been bonded to S. Baldwin, F. Keith and J. H. Hammond of Salt Lake City, Utah, and C. E. Knox. The bond runs for six months.

##### Humboldt County.

C. Bell and D. J. Noyes of the American Nickel Co. have started work in their mine at Nickel (Cottonwood canyon), near Lovelocks, with men, supplies and additional machinery to resume work on their mines.

##### Lincoln County.

Thirty thousand dollars' worth of gold bullion, the result of fifteen days' run at the mill, was shipped last week from the Bamberger De Lamar mines at De Lamar.

At the Bamberger mines at De Lamar the management is crushing the auriferous contents out of 10,000 tons of ore monthly, says Superintendent F. P. Swindler. In the extraction he is em-

ploying 130 miners and trammers. That the wealth of April Fool and the Magnolia mines are not being drawn out at this time, says Superintendent Swindler, is that it is not required, while that of the De Lamar ground more accessible. However, they may be relied on for future needs.

##### Nye County.

At the Tonopah terminal of the new railroad cars are being filled with ore and heavy shipments are being made daily. Among the mines shipping are the Tonopah M. Co., the Montana-Tonopah, January, Combination, Curtis & Ridge lease, Bowes & Kernlek lease, and others in both the Tonopah and Goldfield districts. The cars take ten tons each, and from now on it is intended to ship 100 tons a day. The railway is handicapped from lack of rolling stock, says Superintendent Tripp. The side tracks to the mines on slope of Mount Oddie will be finished this week. Considerable freight is going in, but there is a great deal more on the way.

The C. Rouge holdings at Tonopah have been sold to G. S. Nixon, A. C. Brougher, W. J. Douglas, W. H. Lang, G. Wingfield and E. L. Mims & Co., who will increase development work.

Development is reported improving on south side of Mount Butler, 11 miles south of Tonopah, on the group of claims owned by the New England-Tonopah M. Co. That part of the camp has been little prospected owing to large beds of volcanic tuff exposed on the surface between Butler and White mountain. South of that the company sunk a double-compartment shaft on a narrow vein which carried values but dipped out of the shaft in a few feet. A depth of 191 feet has been reached in a mineralized formation carrying values in gold and silver. Another shaft on another claim was started on the dip of a small stringer which, at a depth of 30 feet, shows quartz carrying values in gold. This vein formation has a clean-cut hanging wall, but no foot wall has yet been reached. The company has put up buildings, and three shifts are worked on both shafts. An 80 H. P. boiler and 50 H. P. hoist will be put in at the main shaft, which will be sunk to the andesite before crosscutting. The company owns sixteen claims.

F. E. Williams et al. at Tonopah have organized the Nevada Electric P. & T. Co. The same parties have also formed the St. Frances M. & S. Co., both of which will be affiliated with the Coaldale Co. They are planning to begin operations this week, and all the works will be located at the coal mine sites, whence power will be transmitted wherever required. Two smelters using two different processes will be built side by side. The same parties have acquired copper and lead mines for fluxing purposes.

##### White Pine County.

At Willard Creek, 10 miles south of Osceola, the Pilot Knob G. M. Co. of Monmouth, Or., which owns several gold-bearing quartz mines in the district, is putting up a 2-stamp battery and concentrator with which to test the ore, says the White Pine News. The machinery for the plant is in position, but completion of the plant is delayed by lack of necessary lumber to house it. In the meantime work at the mines continues and the pack train is transporting ore from the mine to the mill, a distance of 2½ miles.

#### NEW MEXICO.

##### Grant County.

The concentrator of the Burro Mountain C. Co. at Burros, in the Burro mountains, was started last week and is running smoothly. The pumps on the St. Louis are raising water that supplies the camp. The concentrator has a capacity of 100 tons and was hauled in from Pinos Altos to Burros.

##### Sierra County.

R. R. Hopper has placed the Porter mill at Hillsboro in repair and has resumed operations. Fire last week caused considerable damage at El Oro mine at Andrews, near Hillsboro. The shaft house, two hoists, the mine stables and a number of ore wagons were consumed. The collar of the shaft was slightly damaged. The blaze is supposed to have been of incendiary origin.

The 20-stamp mill for the Empire G. M. & M. Co. at Hillsboro is on the ground and is expected to be up by Sept. 1. A shipment of forty tons of high-grade ore will be made this week, the second shipment from the Good Hope Bonanza this month. Thirty men are working. Repairs on the shaft of the Snake mine near Hillsboro are in progress. A larger boiler is being placed. The engine at the Opportunity mine will be moved to the Snake mine to do the work of the engine damaged by the fire.

The camp of Shandon, near Rincon, has been moved from the mouth of Apache canyon ½ of a mile up the Rio Grande to the mouth of Trujillo gulch,

where it is considered safer from floods. The population of the mining district is 150. The Silva properties are the only mines that are being worked at present. The owners, as well as several leasers, are employed on the ground. The output of the camp is \$2000 per month.

##### Socorro County.

The Kelly mine, near Socorro, has increased its output to eighty-five tons of high-grade zinc-lead ore a day and 125 men are at work. The present lease will expire this month and C. T. Brown of Socorro is negotiating for a new lease. About twenty-five men are at work at Estey City, principally on development operations. As soon as a sufficient water supply is obtained the mills will be started, there being sufficient ore on the dump. The Dividend Co. has contracted to have a well sunk to a depth of 1000 feet.

#### OREGON.

##### Baker County.

J. G. Lilly of the Last Chance and Baby McKee groups has a bond on the Griffin claim in the Bear gulch section, near Sumpter. This is to be developed as soon as arrangements can be made. Some placer operations were carried on last spring there, but owing to lack of water the run was short.

F. E. Hobson, manager of the dredging proposition to be started at Sumpter, says he is arranging for preliminary work. Drill holes will be sunk on the ground to decide where the first dredgers will be put to work. M. E. Bain, manager of the Overland group, Cable Cove district, states that the men are sacking ore for shipment to the smelter. Over 300 tons are ready for treatment. A. Mohr, manager of the Wisconsin G. M. Co., which has bonded the Nine Strike property, in Cracker Creek district, says development work will be started next week. The property is said to carry an extension of the ledges of the Buckeye group. The Nine Strike has been opened by tunnel work, and the claims extend from the Cracker creek side over the apex of the Elkhorn range into the Rock Creek district.

Improvement is going on at the Columbia mine, Cracker Creek district, near Sumpter. The mill will be overhauled and additional machinery installed. Other outside buildings will be erected and arrangements made for a larger output at the mine.

Baker City reports say the Virtue mine is placing in position an engine with a pumping capacity of 2500 gallons per minute and a hoist for sinking 2000 feet. Development work is being continued. C. H. Stuller, manager of the White Swan M. Co., Ltd., redeemed that company's property last week by paying to the sheriff of Baker county \$3500. The property was sold for debts contracted by the former management. The mine is fully equipped with hoisting plant and mill. Stuller says it is intended to sink a new shaft rather than to unwater the old one. He has arranged for installing electric power for hoist and mill and expects to resume operations this month. The building for the Emma mine's mill is completed. It is at the mouth of the 1000-foot tunnel, which is being driven toward the vein. The ore shoot will be tapped within 50 feet, and it is expected the bins will be full by the time the stamps are in position. Deals are reported pending for the Flagstaff and Cliff mines, and prospects are for work to be resumed. J. H. Davey and son, who bought the pile of tailings at the Virtue mill, are preparing the ground for the erection of a cyanide plant to work them. Work on the buildings will start this week.

##### Grant County.

(Special Correspondence).—The Gam, recently bonded by Simpson & Graham, is being extensively prospected and they will put on a steam hoist and pump.

The Gold Bug mine proposes putting on a hoist and pump in place of the horse whim.

The Badger M. Co., which has been working with reduced force for a year, is increasing its number of men and intends to add more stamps to the mill for accommodation of the Bull of the Woods mine's ores, which property is controlled by the owner of the Badger. They are building a tramway a distance of ½ mile to connect the two. F. W. Bradley of San Francisco, Cal., is manager.

D. B. Stalter, president and manager of the Mayflower group, is doing considerable work on the property, and has run 3000 feet of tunnel and uncovered several free gold-bearing veins. He intends putting on a stamp mill. The Blue Channel placer mines have ceased operations for the year; the management proposes addition of a saw mill to the plant.

Susanville, Aug. 9.

##### Josephine County.

Superintendent A. F. Nelson of the Eu-

reka mine on Soldier creek, south of Grant's Pass, reports that mine in a prosperous condition. Sinking and drifting is being done with two machine drills, and the ore body is 9½ feet in width. Nelson reports 18,000 tons of ore blocked out. The vein is a contact between slate and dolerite and the ore averages \$18 a ton. The company is operating a 10-stamp mill, concentrator and cyanide plant.

Grant's Pass reports say telluride ore running \$100 a ton is being taken from the ledge of one of the claims of the Lewis & Clark M. Co. on Canyon creek, near Kerby. J. M. Layman et al. are owners and have been developing the group with satisfactory results. These men have six claims, or 120 acres, and, aside from the ledges, there are timber and an abundance of water for power and general mining purposes. The company has men at work opening the ledges, building trails and bridges preparatory to bringing out ore for shipment. Layman says the claims on which they are directing principal work shows an 8-foot ledge, with a porphyry hanging wall and granite foot wall.

#### Lane County.

E. E. Cable of Portland reports development work progressing in the tunnels being driven on both the Durango and Princess groups at Blue River, with favorable indications in the vein formation. The Great Northern is doing development work and the 2-stamp mill is pounding steadily and giving satisfactory returns from the ore being treated. The Badger mine is progressing under the management of G. E. Wagner and a road has been completed to get the mill on the ground that is to increase the output. H. A. Tromp has been increasing work on the Uncle Sam mine, and the mill has been moved to a better location, where it is ready for operation. The Treasure mine has ore blocked out. It is extending tunnels, and on the surface timbers are being prepared for use in construction of the mill.

#### Wallowa County.

Developments are progressing at Eureka copper district at the confluence of the Eureka and the Snake rivers in Wallowa county, 52 miles south of Lewiston, Ida. C. O. Howard of Waukon, Ia., president of the Eureka M., S. & P. Co., says his company is building a copper matting furnace. A portion of the machinery is on the ground and the remainder at Lewiston awaiting completion of the steamer Mountain Gem, which will ply between that point and Eureka. The furnace will have a capacity of 100 tons a day and will test the values of the ores to determine the means for their reduction. One tunnel has been driven 640 feet and has a depth on the lead of 350 feet. The tunnel is run on the lead. The ore body is 2 to 8 feet wide. The ore is chalcopryite and carries 5% copper and \$1 gold values. Surveys have been made for running a crosscut tunnel 1600 feet long to tap four leads at depth. It is also proposed to sink to the 500-foot level on one of the leads. They are operating two electric drills. The company possesses water-power rights, which will be improved as the development of the mines justify. Eureka is on the line of the O. R. & N.'s proposed extension from Huntington, Or., to Lewiston, Ida. A saw mill in operation in the hills back of Eureka is connected with the place by a good wagon road. A Chicago company is doing development work on properties in same district. Thresher Bros. and Roger Bros. are at work on promising leads. Adjoining the Eureka Co. claims the New York C. M. & S. Co. owns a group. J. J. Moynahan of Spokane, Wash., is president and A. J. Murphy, superintendent.

### SOUTH DAKOTA.

#### Lawrence County.

Lumber is being delivered for the new shaft house of the Hidden Treasure G. M. & M. Co. on Deadwood gulch, 1½ miles northwest of Lead, and work has started. Part of the machinery has arrived. A hoisting plant is to be installed and the company will then continue the shaft to deeper levels and crosscut. The bottom of the shaft down 70 feet is in ore. The first crosscutting will be done at the 100-foot level. The ore is of commercial grade and at present rate of development will insure the company a supply sufficient to warrant building a mill. There are millsites on the ground and Deadwood creek carries enough water to furnish a plant of at least 300 tons daily capacity. S. T. Cochran of Lincoln is president and W. Lawter, manager.

The main shaft of the Lucky Strike G. M. Co. is 230 feet deep and sinking steadily. It had been intended to cut a station at 200 feet and crosscut, but they will not begin crosscutting until the permanent water level is reached. The ore in the shaft shows copper values in addition to the gold it contains. The company has at its shaft a hoisting plant and machine

drills. The drills are at present being operated with steam, but an air compressor will be introduced. The company's base of supplies is Deadwood, from which it is distant 15 miles. C. A. Allen is manager.

The Minnesota M. Co. has reached quartzite in its shaft at Maitland and is cutting a station preparatory to drifting. Quartzite was reached in the shaft at a depth of 60 feet and some ore was found in the bottom of the shaft. Drifting will be carried on in two directions. The Minnesota M. Co. owns the former Garden City M. Co. and also the Oscar Waller millsite and the Bill Phillips group of claims adjoining. A wagon road has been built to the shaft and it is intended to put in a steam hoisting plant.

The Globe G. M. Co., near Lead, reports increasing development work. The company will build a reduction plant and work of construction will be started this month. The mill is to be a cyanide plant and will be on the company's Bismark group in Whitetail gulch, near the mine, a few minutes walk from the center of Lead. The pulverizing will be done by a Chili mill, says Superintendent Wade. J. Renken of Sheldon, Ia., is president.

The Puritan G. M. Co. will have its plants in operation this month. The hoist has been set, the gallow's frame is up and the company is enclosing the shaft house. Lumber is on the ground for the mill building and the boiler and part of the mill machinery have arrived. The Puritan property lies along Strawberry gulch, 3 miles above Pluma, and the main shaft is 90 feet deep.

#### Pennington County.

The quartz mill of the Black Eagle G. M. Co., near Rochford, is in continuous operation. The mill is a Huntington with capacity of twenty tons of ore daily. On the property adjoining that of the Black Eagle, the Golden West M. Co. is building a flume, driving a tunnel and cutting lumber for the flume and for a mill building. The tunnel is intended to carry the flume through the hill. It will be 140 feet long. The lumber for the mill of the Black Eagle Co. was sawed at the mill of the Golden West Co. The Golden West quartz mill is expected to have a capacity of from 125 to 150 tons a day, a Chili mill being used for pulverizing.

The Empire M. Co. is putting in a plant of mining machinery on its property near Hill City, and the shaft is to be continued to 200 feet. The ore carries pyrite and it is intended to utilize this ore commercially in manufacture of sulphuric acid.

High-grade ore is being taken out from the Burlington mine on Friday gulch, 9 miles northwest of Hill City. It shows free gold. The Burlington shaft is 120 feet deep and the vein has a breast of 20 inches between walls. The Burlington Co. is preparing to resume operations after a suspension of two months. It is expected a steam hoisting plant will be put in, taking the place of the whim now in use. J. B. Taylor of Hill City is president and superintendent.

### UTAH.

#### Grand County.

The Interstate M. Co., with properties at Basin, in the Gold Basin district 25 miles from Moab, is building a mill to work the low-grade gold ores that have been opened up in the mine.

The Overland mill at Sunshine is in operation again, after several years of idleness, and is treating an average of 150 tons of gold-bearing ore daily. The plant has been remodeled. There is ore blocked out in the mine.

#### Juab County.

Under an agreement between the Bingham Con. smelter and the Carisa M. Co., near Eureka, the latter will begin delivery of 50,000 tons of second class ore for reduction at the former's furnaces, says H. Joseph, manager of the Carisa. This class of ore, which has been accumulating, shows an average of 5% copper, four ounces silver and \$2 gold, with a gross valuation of about \$16. To get out these ores which are exposed on every level in the Carisa, it is intended to put in a boiler and hoist at the main shaft.

#### Salt Lake County.

At a depth of 300 feet in the incline off the main tunnel of the Ohio C. M. Co. at Bingham the management reports 5 feet of ore, which affords 15% in copper, while the product of the mill going to the valley furnaces is being marketed on controls showing 30% copper. To determine the extent of the high-grade ores in the incline, Manager H. Catrow says he will begin driving on the strike of the vein. At present only one wall is exposed in the incline, it having been decided to do no crosscutting until a sump was cut. During July the management forwarded to the smelters about 350 tons of concentrates, in addition to five cars of first-class ore.

Operations are progressing at the plant of the Butterfield M. Co. at Bingham,

under control of Lavignino Bros., with F. Whitmore superintendent. Since acquiring the Butterfield, Lavignino Bros. have remodeled the plant, formerly a stamp mill, equipped it with rolls, jigs and other devices. The ores contain lead, silver and gold.

President E. L. Stoddard says the properties of the Bingham & New Haven M. Co., near Bingham, are to be equipped with an aerial tramway to handle its ores, and a large compressor with which to operate its machine drills. Plans for the tramway are in the hands of the management. The route surveyed for the tram spans a distance of 4500 feet, beginning at mouth of main tunnel and extending to a connection with the Copper Belt Railway at the portal of Yampa tunnel. With this means of forwarding its ores, the cost will have been reduced to a few cents, while the present toll by wagon constitutes one of the largest items in the month's disbursements. It is proposed to operate the compressor by electricity, to be derived from the Telluride power plant at Provo. It is claimed at Bingham that the Rio Grande Railroad Co. will next season, if not the present, add another track to its road between the valley furnaces and the copper camp, and otherwise equip for the expeditious handling of an increased tonnage from the mines, with increased volume of supplies into the diggings. It is said the system will be required to equip itself for the transportation of 100,000 tons of ore daily out of camp before the expiration of another year. The management of the Bingham & New Haven Co. Bingham properties has contracted with the American S. & R. Co. to deliver within the next five years 100 tons of ore daily.

The Cornish pump with which the waters of Bingham canyon are raised to the tables of the Utah C. Co.'s mill at Bingham was overcome last week and the pump flooded. Operations were suspended. Two deep-sea divers from San Francisco, Cal., were sent for, and with their submarine apparatus went down the shaft, closed the bulkheads, shutting off the flow, and repaired and put into operation the sinking pump. The water had risen 85 feet in the shaft. The sinking pump raises 500 gallons per minute, and on this supply the mill resumed operations on the 2d inst. High-grade copper concentrates, running well in gold and silver, are shipped to the furnaces in the valley. On the enlargement of the mill work is in active progress, and with the additions being made to it on each side, its capacity by September 15 will have been doubled, says Superintendent Janney.

#### Tooele County.

During month of July the Honerine mine of Stockton marketed five carloads of high-grade ore and twenty-eight cars of concentrates, the product of twenty-five working days.

#### Washington County.

The management of the Utah & Eastern C. Co. will put down a double-compartment shaft. Heretofore the company has been operating with the single-compartment, which has proven inadequate. The company's mines are at Shem City.

### WASHINGTON.

#### Chelan County.

Chelan reports say H. H. F. Buckner has a contract to run an 800-foot tunnel in the upper Horseshoe basin to cut the Davenport ledge at depth of 700 feet. The tunnel is owned jointly by the Cascade G. & C. M. Co. and the Horseshoe Basin M. Co. After the ledge is reached, Buckner will drift on it to the intersection of the properties. Between \$700 and \$800 is being expended on the trail from Park creek to Horseshoe basin, and more men will be put to work on the trail and tunnel. Pearl & Dick are running an 80-foot tunnel on the P. & D. mining claim, 14 miles up the lake from Chelan, and it is showing values. The ledge appears to be 200 feet wide on the surface and assays in gold, silver and copper.

#### Lincoln County.

A copper smelting plant is being built for the Turk M. Co., whose properties are in Cedar canyon, 25 miles north of Davenport. Its construction is similar to the ordinary water jacket furnace, says the Spokesman-Review. One of these parts is charged with fuel, ore and fluxes in alternate layers, as in the ordinary practice. The other is charged with ore and fluxes only. The air blast is introduced at the top of the part containing fuel and ore. The blast passes down through it and up through the one charged with ore and flux. It is claimed that by this method a more perfect combustion and intense heat is obtained. The furnace has a capacity of 100 tons per day. The mine is owned and operated by Davenport men.

### WYOMING.

#### Albany County.

W. B. McNeel, secretary of the Ideal M. Co. of Pueblo, Colo., operating in the Keystone mining district, near Laramie, reports work progressing on the property of the company, the Florence, Keystone and Blue Jay claims. The ore on the dumps of the Florence and Keystone carries gold and it is intended to erect a cyanide plant at the mines and work the ore in the dumps before further ore extraction is started.

H. E. Owen of Norfolk, Neb., manager of the Blanche C. M. Co., says he has shipped to Laramie a plant of machinery, including a hoist, pump and boiler, which will be freighted out to the mine. The property owned by the Blanche company is contiguous to the New Rambler. At the Strong mine Manager Swigart reports ore struck in the 150-foot level. Copper glance is showing and it is thought the ore is the shoot cut at the 100-foot level.

#### Carbon County.

P. S. Delany of Colorado Springs, Colo., interested in the Portland mine, near Encampment, reports development progressing. The North American C. Co., owner of the Ferris-Haggarty mine, has contracted for addition of 800 H. P. to the treatment plant, which will enable it to increase the copper output. The company is treating from 200 to 275 tons a day, has 100 men in the smelter and on the tram and 160 underground. During the summer months power is generated by water. The steam plant to be built will permit of uninterrupted operations the year around. The deepest workings in the mine are down 390 feet. The Portland mine is being developed by the Battle C. M. Co. A tunnel is following a vein from which 13½% copper ore is being obtained, with gold values, says Delany. Owing to lack of a mill and transportation facilities, the ore is being piled on the dump. Ore has been opened at five places on the surface. In a 10-foot surface cut a vein, measuring 18 inches, was opened. It is intended to explore five known bodies, and by the time the railroad arrives the Battle company expects to have enough mineral, of varying grades, on the dump to keep a 100-ton smelter in operation.

### FOREIGN.

#### BRITISH COLUMBIA.

##### Boundary District.

From eight to ten horses are used by the Granby mines, at Phoenix, underground in hauling ore cars, in addition to the two saddle-tank Davenport locomotives. Six furnaces are again handling ore at the Granby smelter, after three weeks idleness for repairs. The ore output from Phoenix camp approximates 2000 tons daily.

The McKinley M. Co. is being incorporated by B. Lequime, D. Whiteside, C. M. Kingston, H. W. Warrington and G. A. McLeod of Grand Forks for working the McKinley claim in Franklin camp.

W. R. Williams, of the Dominion C. Co., formerly owner of the Brooklyn group of mines, says he has turned the same over to the new company. Manager Collins and Foreman Callahan have men at work in the Brooklyn and Stemwinder shafthouses, unwatering the mines. The number will be increased as fast as the men can be used to advantage. In the meantime the Montreal & Boston smelter of the company at Boundary Falls is being prepared for blowing in.

##### East Kootenay District.

F. R. Byron, having placer holdings in the gravel and surface wash on the hillside below the Badger and Red Mountain claims, near Fort Steele, is extensively prospecting them. He has taken water out of Manchester creek. He will complete the ditch and flume built last fall to provide water power for a mill.

##### Rossland District.

The Velvet mine, on Sophie mountain, near Rossland, has 100 sacks of concentrates milled. About twenty men are at work. Since the consolidation of the Blue Bell and the Sophie mines, a few men have been put to work in the 480-foot tunnel on the Sophie mine.

##### Slocan District.

The Ivanhoe mine at Sandon, owned by Detroit, Mich., men, is shipping silver-lead ore which averages from 85 to 100 ounces per ton and is also marketing zinc, says P. Hickey, manager of the company. In the Slocan the mining industry is improving; zinc is adding to the output. So far for 1904 they have shipped 800 tons of zinc concentrates from the Ivanhoe against 500 tons for the whole of 1903. They are sending it to Denver, Colo. The Dominion government's lead bounty has been of great help to the silver-lead mines.

G. O. Buchanan, administrator at Nelson of the lead bounty, gave out last week

checks for lead bounty payments. Fifteen arrived together, representing \$14,999.85, though the checks varied from \$50 to \$3000. The claimants are the Dundee, Arlington at Erie, Lorna Doone, Paradise, Triune, Mountain Con. (two checks), Wakefield at Silverton, Antoine at McGuigan, Echo, Lucky Boy, Slocan Star at Sandon. Three more were received, aggregating \$2100.

West Kootenay District.

Cambridge reports say the Goldfinch stamp mill, which has been idle since last January, has been started again under direction of J. T. Volger. Men are working at the property, operations being confined to a surface showing from which good values have heretofore been obtained.

MEXICO.

Chihuahua.

In the Cierro de Naica, 16 miles west of Concho, on the Mexican Central railway, La Naica M. Co. is operating two mines. In its San Francisco mine it reports ore blocked out, assaying 300 grams of silver, 20% lead and 20% iron. The main shaft is down 125 meters and in ore. The Dolores also shows ore blocked out, assaying 500 grams silver, 30% lead and 20% iron; and its main shaft is down 70 meters. The Lepanto mine in same section is shipping thirty-five cars per month of ore assaying 350 grams silver, 15% lead, with low copper values. The main workings are down 90 meters. There are no steam engines in the camp, either gasoline hoists or horse whims being used in raising the ore. No water has been found in any of the mines—all water used being brought in over the narrow gauge railroad from Concho or in carts a distance of 8 miles.

Durango.

The Evanston M. Co. has bought La Purisima mine, near Gabriel station, on the Inter-oceanic Railway. The ore carries gold, silver and lead values. Development will be increased.

Guerrero.

Superintendent W. W. Miller, at the Mina Grande group, near San Nicholas de Oro, says it is proposed to build a 60-stamp mill at the mine, which is being operated by the Balsas Valley M. Co.

Jalisco.

The American Co., managed by W. H. Lees, has put in operation a 50-ton concentrator at the Soquita Prietas mines, south of Ayuta. The ore is low-grade copper.

Sonora.

J. M. Morrison of Washington, D. C., manager of the Richfield M. Co., says the holdings of the company at Tuape are extensive and carry values in copper. Development work has opened ore bodies, and the company is arranging for building a reduction plant.

R. S. Dewar of the Chicago Gold Placer Co., operating near Saqui Grande, says the company's dredger is at work successfully. He also states that two more boats are to be ordered, so as to increase operations. The dredgers are of the Risdon type and cost \$120,000 each; they have a capacity of 3000 cubic yards of earth each. He says the cost of dredging in Sonora is 12 cents per cubic yard.

G. A. Case et al. are preparing to develop a group of mines which they own near Santa Rosa. Operations will begin next month and machinery will be put in.

No. 8 furnace, nearing completion at the Cananea Con. C. Co. works at Cananea, will be the largest copper furnace in the republic, says the Cananea Herald. It is 56x180 feet at the tuyeres and is capable of carrying a charge 14 feet in depth. It is arranged to be mechanically fed and equipped with steel jackets, which are constructed with staybolts. The furnace discharges into a forehearth, which, as well as the crucible in the furnace proper, is lined with "chrome" brick. The furnace is designed to have a working blast pressure of 35 ounces, and at other places where the same type is in use it puts through 6½ to 7½ tons per square foot of hearth area each twenty-four hours, i. e., 450 to 525 gross tons.

W. N. Ten Eyck, superintendent of the mines of the American-Mexican C. Co., near Llano, says he is preparing to make increased shipments of gold, silver and copper ores, which are being taken out of the mines, to the Copper Queen smelter at Douglas, Ariz., for treatment.

NORWAY.

The final payment on the Utah Nickel Co.'s holdings of nickel-bearing mines on the west coast of Norway was made August 1, says M. Christophersen of Salt Lake City, Utah. The installation of a process with which to reduce the ores will be started this month. Fifty miles away an electrical process is being used with effective results in the extraction of nickel, and it is proposed to employ similar methods at the Christophersen group.

Personal.

W. W. CANBY of Philadelphia is at Eureka, Colo.

NATHAN GREGG has returned to Denver from Silverton, Colo.

J. F. CONDON, a mine owner of Verdi, Nev., is in San Francisco, Cal.

GEO. L. HOLMES has returned from San Francisco to Folsom, Cal.

P. C. WEBER, a mine owner from Ely, Nev., has returned from a trip East.

C. MASSON of Los Angeles, Cal., is in San Francisco, Cal., on mining business.

H. ANDERSON, a mine owner of Chihuahua, Mexico, is in San Francisco, Cal.

R. M. GREEN of Oroville, Cal., is in San Francisco, Cal., on mining business.

CHAS. BORN of Wickenburg, Ariz., is visiting in Silverton and other Colorado points.

H. GATES has returned to San Francisco, Cal., from mine examinations in southern California.

C. M. ODDIE, interested in Nye county, Nev., mines, is in San Francisco, Cal., from Tonopah, Nev.

W. WEHNER is in San Francisco, Cal., from the quicksilver mines at Evergreen, Santa Clara county, Cal.

F. P. SWINDLER, superintendent of the Bamberger mines at De Lamar, Nev., is in Salt Lake City, Utah.

G. L. MOATS returned to Salt Lake City, Utah, last week, from a mine examination at Humboldt, Nev.

S. J. HENDY, of the Joshua Hendy Machine Works, San Francisco, Cal., is in the East on a business trip.

T. J. MURPHY of Needles, Cal., interested in southern California oil properties, is in San Francisco, Cal.

S. K. THORNTON, superintendent of the Shenandoah mine, near Plymouth, Cal., is in San Francisco, Cal.

CYRUS BRADLEY returned last week to Spokane, Wash., from a visit to his mining interests in eastern Oregon.

L. G. HARDY has returned to Salt Lake City, Utah, from making mine examinations near Battle Mountain, Nev.

A. J. McDONNELL, superintendent of the Union and other mines at Virginia City, Nev., is in San Francisco, Cal.

M. R. GALUSHA, manager of the Jumbo mine at Rossland, B. C., returned to Spokane, Wash., last week from the mine.

J. M. BIDWELL, assistant manager of the American S. & R. Co., is in San Francisco, Cal., from Salt Lake City, Utah.

F. WHITMORE, recently at Bisbee, Ariz., is superintendent of the mines of the Butterfield M. Co., at Bingham, Utah.

G. W. MAYBEE is manager of the Newfoundland G. & S. M. Co., operating the Newfoundland mine, near Central City, Colo.

D. McVICHIE returned last week to Salt Lake City, Utah, from Mexico, where he has been making mine examinations.

J. M. MORRISON of Washington, D. C., manager of the Richfield M. Co., is at the company's mines at Tuape, Sonora, Mexico.

P. J. DONOHUE, of the Western Exploration Co., is in San Francisco, Cal., from Salt Lake City, Utah, on mining business.

B. L. BROWN, of Philadelphia, Pa., is president and manager of the New York-Tonopah G. M. Co., operating at Tonopah, Nev.

A. G. ELLIS, recently of Lake City, Colo., is superintendent of the mill of the San Juan Ore Co., at Rico, Dolores county, Colo.

J. W. PROUT, JR., of Tucson, Ariz., has been appointed engineer and metallurgist at the Old Mowry mine, near Nogales, Ariz.

W. N. TEN EYCK, superintendent of the American-Mexican C. Co. at Llano, Sonora, Mexico, returned last week from a trip to California.

N. DUNYON AND A. E. HYDE have returned to Salt Lake City, Utah, from making mine examinations in the Cariboo mining district in Idaho.

G. McM. ROSS, manager of the Union copper mines at Copperopolis, Calaveras county, Cal., has gone to Shasta county, Cal., on mine examinations.

C. K. MCCORNICK, of Salt Lake City, Utah, returned there last week, after at-

tending the annual meeting of the Gold Roads Co. of Arizona, in Paris.

C. H. GODDARD, manager of the Tarasca gold mine, at Torres, Sonora, Mexico, has returned to San Francisco, Cal., from a several weeks' visit at the mine.

G. W. KAISER of San Francisco, Cal., has returned from a visit at the properties of the Zubiate M. Co., at Zubiate, Sonora, Mexico, in which he is interested.

T. C. WOODWORTH, consulting engineer of the Anita C. Co., returned last week to the company's mine at Anita, via Williams, Ariz., from an Eastern trip.

HAROLD HARVEY of Oakland, Cal., is superintending construction of a 30-mile ditch for a Seattle, Wash., hydraulic mining company, operating near Teller City, Alaska.

MANAGER I. E. ROCKWELL of the Minnie Moore M. Co., at Hailey, Idaho, has gone East, and L. Price, Jr., the metallurgist, is in charge of the Minnie Moore mine and mill.

C. H. SPINKS of Berkeley, Cal., is manager of the American Magnesite Co., with mines in Santa Clara and Alameda counties, Cal. E. L. Richmond is superintendent of the mines.

E. P. GILMAN, of the firm of Pellet, Harvey, Bryant & Gilman, of Vancouver, B. C., is examining for the purpose of making a report on mining property on Princess Royal island.

M. S. KETCHUM, C. E., in charge of the Kansas City, Mo., office of the American Bridge Co., has been appointed professor of civil engineering in the University of Colorado at Boulder, Colo.

Commercial Paragraphs.

THE Western School of Mines is now established at Belmont, Cal., to teach practical mining work.

E. A. RIX, of the Rix Compressed Air & Drill Co., has returned to San Francisco from the East, where he arranged with the Chicago Pneumatic Tool Co. for the manufacture and sale of the torpedo rock drill on the Pacific coast.

THE General Metals Co., 11 Broadway, New York, owners of the Moore slimes process, has just closed two contracts in New South Wales, Australia, for the installation of the Moore method of treating slimes. One of these is for a 200-ton per day plant at the Occidental mine, Cobarr, New South Wales, and the other is for the treatment of 250,000 tons of tailings at a dump on the Chappel mine property, in the same section.

THE Wellman-Seaver-Morgan Co. of Cleveland, O., have closed a contract with the Leiter Coal Co. for the construction and erection of a hoisting plant at their mines at Zeigler, Ill., consisting of a steel head frame and double-cylinder hoisting engine. The contract was awarded to the Wellman-Seaver-Morgan Co. in the face of severe competition, and they were given the job on account of their ability to promptly execute the work. This is the second contract that the Wellman-Seaver-Morgan Co. have from the Leiter Coal Co., the first consisting of a complete hoisting and coal handling plant, which is now in successful operation.

THE J. Geo. Leyner Engineering Works Co. of Denver has recently shipped a complete machinery plant, including compressor, hoister and drills, to the Violet Mines, Ltd., of Alaska; a large air compressor to the Westport Coal Co. of New Zealand; an air compressor and several drills to Japan; a complete mining plant to the Red Mountain Railroad, M. & S. Co.; compressor and hoister to the Dakota M. & M. Co. at Deadwood; compressor and drills to the Nobles gold mines in California; a single-decked mine cage to the Columbus Co. at Deadwood, and two double-decked mine cages to the Uncle Sam mine at Roubaix, South Dakota.

THE Power & Mining Machinery Co. started business a little over a year ago, having secured the works of the Hulthoff Mining Machinery Co. at Milwaukee, where it immediately commenced extensive improvements for the manufacturing of its gas machinery. The extension of these works was begun in August, 1903, and will be ready within sixty days for extensive operations. In the meanwhile the company has taken upwards of a million dollars worth of orders for Loomis-Pettibone gas apparatus and Crossley gas engines, which are being constructed in their shops at the present time. These orders have been placed with the most representative and conservative companies, among which are the following: Velardena M. & S. Co., Velardena, Durango, Mexico; F. W. Snow, Hillburn,

N. Y.; Gould Coupler Co., Depew, N. Y.; D. Lovejoy & Son, Lowell, Mass.; Ramapo Iron Works, Hillburn, N. Y.; Pennsylvania Steel Co., Steelton, Pa.; Dufréne & Locke, Montreal, P. Q., Canada; Milford Electric Light Co., Milford, N. H.; Motor Engine Co., 15 William street, New York City; Potosins Electric Co., San Luis Potosi, S. L. P., Mexico; Amparo M. Co., Drexel Building, Philadelphia, Pa.; International Steam Pump Co., 114 Liberty street, New York City; Atha Tool Co., Newark, N. J.; Elmira W. L. & R. Co., Elmira, N. Y.; Sayles' Bleacheries, Saylesville, R. I.; W. H. Cone, Berlin, Ont., Canada; Bay State Forge, Cambridge, Mass.; Newton G. & E. Co., Newton, N. J.; Lexington Ry. Co., Lexington, Ky.; Wellington Meat Export Co., Ltd., Wellington, New Zealand; Avino Mines of Mexico, Ltd., Avino, Durango, Mexico; Phelps, Dodge Co. (Moctezuma C. Co.), Nacozari, Sonora, Mexico; Taylor Manufacturing Co., Columbia, S. C., and others.

At the plant of the Edison Electric Co. near Redlands, Cal., a Pelton water wheel is operating under a head of 1950 feet—equivalent to 850 pounds pressure per square inch. This wheel is direct coupled to an electric generator of 1000 H. P. capacity, the current is transmitted to Los Angeles, Cal., the station being only one of many controlled by this electric system, which has a large number of Pelton wheels in use, under heads ranging from 100 feet up to the above named, 1950 feet. Under such an extreme pressure the water issuing from the nozzle may be likened to a bar of steel; by experiments it has been found that a sledge hammer has no effect upon it, owing to its density. The demands for cheap power, together with the advantages of water at hand, naturally led to the development of a water wheel to supply the connecting link, and it was a pioneer Californian, L. A. Pelton, who first conceived the idea of a water wheel to operate under high heads. In the days of '49 this wheel was called the "Hurdy Gurdy" wheel, and consisted of a wooden rim, to which was bolted cast iron cups, or buckets. The water impinging on the buckets, through a round nozzle, caused the wheel to revolve, and the peculiar shape of the buckets enabled a high useful effect to be obtained from the water. "Later on the fundamental patents were acquired by the Pelton Water Wheel Co., who, by experiment, further developed the original idea—of course making radical changes in design and construction—and succeeded in producing a wheel from which most satisfactory results are obtained. An efficiency of 90% has been reached by the use of this wheel, which, however, was under most favorable conditions; but efficiencies of 80% and 85% are realized in actual practice." The Pelton Water Wheel Co., with headquarters in San Francisco, Cal., have built up a large industry in the manufacture of water wheels alone, having given exclusive attention to this specialty. In the last sixteen years they have installed over 11,000 wheels, aggregating in excess of 1,000,000 H. P., the power ranging from a fraction of 1 H. P. up to 10,000 H. P. in a single wheel unit. It is indicative of enterprise that one may find this California machinery product in use for driving fans in a bungalow in India, and again, for operating a 30,000 H. P. electric plant in Oregon.

Trade Treatises.

"Before and After," a folder from the Ingersoll-Sergeant Drill Co., 26 Cortlandt street, New York, graphically portrays past and present, in a condensed account, of operations of the Cleveland Stone Co.'s quarry, showing resultant economy by use of their central compressed air plant.

"Some Golden Opinions by the Other Fellow on Water Leyner Air Rock Drills," being extracts from letters received from pleased patrons, is the name of a little treatise in black and gold from the J. Geo. Leyner Engineering Works Co., Denver, Colo. These letters are "from all over," and make a fine recommendation. The J. Geo. Leyner Co. furnish complete drilling and hoisting plants. Their exhibit at St. Louis is in the Palace of Mines and Metallurgy, block 81.

"What We Do" is the terse title of a 36-page folder from the Wellman-Seaver-Morgan Co. of Cleveland, Ohio, which gives a cursory but impressive idea of the great scope of their work, which embraces among other things the building of all sorts of equipment for any and every operation involved from extracting ore to turning out the finished product therefrom. Any one interested in a large mining or engineering proposition could read this folder with profit.

## Latest Market Reports.

SAN FRANCISCO, August 12, 1904.

## METALS.

**SILVER.**—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58½c, refined (1000 fine); San Francisco, 58½c; Mexican dollars, 47½c San Francisco, 45½c New York.

**COPPER.**—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$12.75; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £55 10s spot per ton.

**LEAD.**—New York, \$4.25; Salt Lake City, \$3.50; St. Louis, \$4.12; San Francisco, \$4.50, carload lots, 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 16s 3d long ton.

**SPELTER.**—New York, \$4.85; St. Louis, \$4.75; London, £22 2s 6d per ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

**TIN.**—New York, pig, \$26.65@26.85; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, \$30@32½c. London, £121 6s spot.

**PLATINUM.**—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@82c per gram.

**QUICKSILVER.**—New York, \$42.00@44.00, large lots; London, £7 17s 6d San Francisco, local, \$41.50@43.00 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.00@42.00.

**BABBITT METAL.**—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

**SOLDER.**—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

**ZINC.**—Metallic, chemically pure, \$3.10, 50c; dust, \$3.10, 10c; sulphate, \$3.10, .04c.

**NICKEL.**—New York, 40@47c per lb.; ton lots, 40@47c.

**ALUMINUM.**—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

## STRUCTURAL MATERIALS.

**IRON.**—Pittsburg, Bessemer pig, \$12.60@12.85; gray forge, \$12.00; San Francisco, bar, 3c per lb., 3½c in small quantities.

**STEEL.**—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00@23.00; San Francisco, bar, 7c to 12c per lb.

**WHITE LEAD.**—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5-lb. tins, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

**LUMBER.**—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50@5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00@35.00.

**NAILS.**—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

**LIME.**—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

**CEMENT.**—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

## GENERAL SUPPLIES.

**ANTIMONY.**—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

**POWDER.**—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2.00 per keg. CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50@7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

**FUSE.**—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

**CANDLES.**—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

**CHEMICALS.**—Cyanide of potassium, 98%—99%, jobbing, 23@24c per lb.; carloads, 22@23½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur,

French, 3½@3¾c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1¼@2c per lb.; nitric acid, carboys, 8c per lb.

**OILS.**—Linsseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Spem, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S. bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Spem, crude, 63@68c; Natural White, 65c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

**ALUMINUM.**—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

**BONE ASH.**—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

**RED LEAD.**—500 lbs. and over at one purchase, \$3.10, 7c; less than 500 lbs., 7½c.

**LITHARGE.**—Pure, in 25-lb. bags, 8@9c per lb.

**MOLYBDENUM.**—Best, \$2.00 per lb.

**CHROMIUM.**—90% and over, \$3.10, 80c.

**PHOSPHORUS.**—American, \$3.10, 70c.

**SILVER.**—Chloride, \$3.10, 90c@1.00; nitrate, 55c.

**MERCURY.**—Bichloride, \$3.10, 77c.

**MAGNESIUM.**—Pure, N. Y., 60c.

**MANGANESE.**—\$3.10, \$2.75.

**SODIUM.**—Metal, \$3.10, 50c.

**BISMUTH.**—Subnitrate, \$3.10, \$2.10.

**URANIUM.**—Oxide, \$3.10, \$3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING AUGUST 2, 1904.  
765,485.—VEHICLE—J. E. Armstrong, Santa Cruz, Cal.  
765,583.—BOILER—T. J. Barbour, S. F.  
765,416.—WATCH WINDER—J. H. And, Fresno, Cal.  
765,420.—FACET—E. J. Calley, S. F.  
765,666.—RECORD MEDIUM—E. D. Casterline, Los Angeles, Cal.  
765,595.—ORNAMENTAL DEVICE—L. B. Christopher, San Jose, Cal.  
765,670.—SHOVEL—T. Cox, Portland, Or.  
765,599.—CANDLE HOLDER—E. W. Curtiss, Baker City, Or.  
765,341.—GRAPHOPHONE—E. Gilbert, Portland, Or.  
765,689.—SASH FASTENER—W. Goodcell, San Bernardino, Cal.  
765,694.—DIE LIFTER—E. B. Hawkins, S. F.  
765,247.—TOOTH BRUSH—C. Heilrath, Sacramento, Cal.  
765,349.—FOLDING BED—S. J. Herrick, Seattle, Wash.  
765,188.—BRIQUET—G. W. Hopp, Olympia, Wash.  
765,624.—SOAP HOLDER—T. P. Jarvis, S. F.  
765,700.—MOTH EXTERMINATOR—H. H. Kennedy, Goodyear's Bar, Cal.  
765,764.—WATER SEAL TRAP—J. E. Keyt, S. F.  
765,447.—RIFLE SIGHT—C. Kliesig, San Diego, Cal.  
765,505.—CHILL ROASTER—Knapp & Ortega, Los Angeles, Cal.  
765,510.—CAN CLEANING MACHINE—W. Munn, S. F.  
765,515.—ELEVATOR—E. C. Northrup, San Jose, Cal.  
765,885.—STEP LADDER—O. Richardson, Applegate, Cal.  
765,380.—HALFTONE SCREEN—A. G. Russell, Los Angeles, Cal.  
765,395.—SPRING BOARD—C. W. Schilling, Portland, Or.  
765,400.—MANUFACTURE GAS AND COKE—J. C. H. Stut, Oakland, Cal.  
765,553.—APPARATUS FOR GAS AND COKE—J. C. H. Stut, Oakland, Cal.  
765,554.—MANUFACTURING GAS—J. C. H. Stut, Oakland, Cal.  
765,515.—APPARATUS FOR MAKING GAS AND COKE—J. C. H. Stut, Oakland, Cal.  
765,780.—VEHICLE WHEEL—H. H. Taylor, San Jose, Cal.  
765,782.—NUT LOCK—E. Wacker, Stockton, Cal.  
765,478.—GAS MACHINE—R. H. Walters, Los Angeles, Cal.  
765,208.—IRONING BOARD—C. H. Williams, Fowler, Cal.  
765,565.—FISHING GEAR—A. W. Wilson, S. F.  
765,786.—TYPE CLEANER—A. M. Wing, Spokane, Wash.  
765,788.—ARC LAMP—O. N. Wiswell, Snoqualmie Falls, Wash.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VEHICLES.—No. 765,485. Aug. 2, 1904. J. E. Armstrong, Santa Cruz, Cal. This invention relates especially to the mounting or suspension of the body of the vehicle upon springs by which it is supported from the axles or running gear. It consists in a novel means for suspending the body by swinging links and hangers and in the connection therewith of springs which are operated in unison to depress all parts of the body simultaneously without reference to the part upon which the load may be placed.

CAN CLEANING MACHINE.—No. 765,510. Aug. 2, 1904. Wm. Munn, San Francisco, Cal., assigned to Alaska Packers' Association of San Francisco, Cal., a corporation of California. This invention consists in the combination, with a mechanism by which the cans are transmitted to the cleaning device and they are advanced and arrested while they are continuously rotated, of a blast and a valve mechanism by which said valve is automatically opened whenever a can is presented and

closed after the can has passed beyond its influence. It also comprises means for controlling the supply of cans to the endless traveling chain by which they are advanced to the cleaning device and a means for regulating the tension of the conveyor chain.

## ASSESSMENT NOTICE.

ORLEANS CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 6th day of August, 1904, an assessment (No. 2) of seven and a half (7½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 10, No. 324 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of September, 1904, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 31st day of October, 1904, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.  
GEO. F. THURSTON, Secretary.  
Office—Room 10, No. 324 Pine street, San Francisco, California.

## CHEAP POWER.

For All Using Gas Engines.

## ACME RETORTS

ADAPTED TO ALL STYLES.

CRUDE OILS, COAL OIL, and All Kinds of DISTILLATES Used with Absolute Success, and a Saving of from \$25 to \$75 in Every \$100 of Previous Fuel Cost.

All requirements of MARINE GAS ENGINE SERVICE Perfectly Fulfilled.

Expert Mechanical Work Done, and Estimates Given for Converting Gas Engine Power Plants for the Reliable and Economical Consumption of Cheap Fuel with

SATISFACTION GUARANTEED.

## ACME RETORT CO.

321 Mission St. SAN FRANCISCO.

## "SALTED" INDICATORS

as well as salted mines. They look well, but don't "make good." Buy one with a reputation—

## ROBERTSON-THOMPSON.

Lasting service. Duplicate parts at all times. Price but a trifle higher than the "salted" kind. There's lots of "salting" done in PACKING. "EUREKA"

the packing that shows less expense and greater profits. There's no guess work about quality or durability. All good dealers carry it. The GENUINE.

JAS. L. ROBERTSON &amp; SONS, 204 Fulton St., N. Y.

FOR USE IN  
SMOKE or  
GAS in  
MINES.

## PERFECT PROTECTION

afforded only by the  
VAJEN HEAD PROTECTOR.  
VAJEN-BADER CO.  
RICHMOND, IND.

## WEALTH IN SIGHT.

The Territory tributary to the

## Santa Fe System

In INDIAN TERRITORY, TEXAS, COLORADO, NEW MEXICO, ARIZONA and CALIFORNIA, offers to limited investments of capital, backed by energy and brains, unusual opportunities for development of GREAT MINERAL PROPERTIES.

Deposits of the following are known to exist on and within a few miles of our lines:

Antimony, Alum, Asbestos, Asphalt, Bayrites, Bauxite, Borax, Cement Rock, Coa Cryolite, Clays of all kinds, Copper, Gold Graphite, Gypsum, Granite, Iron, Kaolin, Lead, Lithograph Stone, Manganese, Mica, Marble, Mineral Paints, Nitre, Nickel, Natural Gas, Onyx, Petroleum, Phosphate Rock, Pumice Stone, Pyrites, Quicksilver, Salt, Silica, Strontianite, Stone-Oolite, Lime and Sand, Silver and Zinc.

For further information, address

WESLEY MERRITT,

Industrial Commissioner,

Atch., Top. and Santa Fe System, CHICAGO, ILL.

## MINING HOIST. LATEST IMPROVED.

Operated with Gasoline, Distillate or Crude Oil direct, without Generator, making it the cheapest and most efficient hoisting outfit on the market. Built all sizes.

Also, Pumping and Irrigation Plants. Write for information.

Corliss Gas Engine Co. Inc.

(Successors to ORIENTAL GAS ENGINE CO.)

223-225 FOLSOM ST., SAN FRANCISCO, CAL.

# MINING AND SCIENTIFIC PRESS.

Whole No. 2300.—VOLUME LXXXIX.  
Number 8.

SAN FRANCISCO, CAL., SATURDAY, AUGUST 20, 1904.

THREE DOLLARS PER ANNUM.  
Single Copies, Ten Cents.

## Systematic Mine Development.

While undoubtedly the miners' maxim, "follow the ore," is a good one, and as a general principle is a better one than that which advises vertical shafts and mine workings laid out with absolute mechanical accuracy, it is unwise for the mine operator to follow the ore so closely that no prospecting beyond the walls of the vein is undertaken. Many good mines have been shut down and abandoned for years, simply through the failure to extend the work of exploration beyond the walls of the vein. Ore shoots in veins pinch out, overlap, and send out branches, and it should be the aim of the careful mine superintendent to keep in sight all the possibilities of his mine, by means of properly-directed crosscuts, as well as to explore the single fissure in which he chances to find a body of pay ore. Some years since a mine operator bonded a mine in the Southwest, pushed development work expeditiously, but always in the ore shoot, stopping work as soon as the workings ran out of ore. As a result the extent of the ore shoot was soon determined, and the mine was disposed of at a price much below that which had been anticipated. A short time thereafter the disappointed operator described the conditions found at the mine, saying that the ore shoot "feathered out" on the edges, the walls not being in sight—there being heavy selvages of clay present. A mining engineer, to whom these conditions were described, at once gave it as his opinion that the ore shoot was only one of a series and that another would be found by crosscutting either to foot or hanging, and this proved to be the case, for within 6 feet a second shoot was discovered by crosscutting to the hanging side, and this proved to be characteristic of the occurrence of ore in that mine. When a mine is first opened, it is wise to have the workings follow the vein closely, but

Concrete Walls and Steel Frame of North Star Mill While in Course of Construction, Grass Valley, Cal.—(See Page 120).

later, when the development of the vein justifies it, it is often more economical to sink a vertical shaft in the hanging wall, which will intersect the vein at an angle in either foot or hanging wall, preferably the latter, that ore might be hoisted at less expense and in greater amount than through a shaft having numerous changes of dip and other irregularities.

Power House of the North Star Mines, Grass Valley, Cal.—(See Page 120).

## Ditch Right of Way.

The United States District Court at Nome has rendered a decision in the Nome ditch cases which is likely to delay to a great extent the completion of several important ditches and deter the starting of other similar enterprises. The greater part of the rich known placer deposits has been exhausted, and the future activity of placer mining in that region depends to a great extent upon the development of water for hydraulic mining. To this end several large concerns have secured water rights, and were engaged, until enjoined by the court, in running ditches to points which will give a sufficient head for hydraulic operations. This required the construction of many miles of ditch, which afforded employment to hundreds of men; but of necessity these ditches pass over a greater or less number of mining claims in their course. The mining law effective in Alaska is the general mining law of the United States Statutes, which makes provision for right of way for railroads over private property, but none for ditches.

The conditions in Alaska, in the absence of local legislative power, have resulted in the passage of numerous local regulations, enacted by the miners of the numerous districts; but these are extremely uncertain in their operative force, and, until passed upon by the courts, can not be depended upon. The companies engaged in ditch construction entered into these various enterprises in good faith and had the moral support of the greater number of miners and claim owners; but upon the discovery that the ditch builders were not permitted by law to construct their canals over the property of others, and could not condemn a right of way for this purpose, as mining is not recognized as a public utility, there was a rush for the unclaimed lands along the surveyed lines of ditches, and numerous "bench" claims were located and their value fixed at exorbitant figures. While the claims located prior to the establishment of the ditch line will undoubtedly be able to maintain their demands, those located subsequently will probably be held subject to the prior existing rights of the ditch owners. In the case in question, that of the owners of Claim No. 6 on Dexter creek vs. the Miocene Ditch Co., the court held that the company was a foreign (California) corporation, and that the laws controlling Alaska lands made no provision that a foreign corporation could exercise the sovereign right of eminent domain. In the United States the right of eminent domain may only be exercised by public utilities, such as railroads, etc., and as in the United States mining is recognized as a private industry, it has not this supreme right. That the action of the claim holders is the result of shortsightedness is evident, as they obstruct the further development of an important industry, while not in any way promoting their own interests.

## Theory vs. Practice.

In all practical industries, of which mining is an illustrious example, there arises as an outgrowth of practice numerous theories—ideas of scientific, practical in, often of an impracticable sort. One may have a conception of how fine or how coarse a certain ore should be crushed, but the fact is, it must be tried by experiment before the truth can be positively known. A concentrator man says, "Your machines are running too fast." "How do you know?" inquires the man being criticised. "Because," is the reply, "at the Golden Giant we ran this kind of machine at 160 revolutions and did fine work, and you are running 200." "Well," was the reply, "this is not the Golden Giant, and our tailings run 20 cents." This is the real test of the efficiency of the method, provided the capacity is not so far reduced as to cause the close saving made to be more costly than the result achieved. So it is with the operation of rolls, the running of a smelter, or the sinking of a shaft. The mine and the mill superintendent cannot afford to drop into a rut, but must keep abreast of the times and vary their practice to suit the conditions, greatly varying in different mines and often changing with time at the same mine. He must have ingenuity, but the practical always dominates the purely theoretical; but these two should always go hand in hand to produce the best economic results.

## Modern Mill Equipment.

The tendency in modern milling equipment is toward that which is more substantial and enduring than that usually found in similar constructions in the past. Twenty-five years ago when a thoroughly equipped quartz mill was completed and supplied with every requirement at that time considered necessary to a first-class and up-to-date plant, it was thought that a mortar would not last longer than five to six years with active surface, and when the mortar was worn out it was also generally time to repair or completely renew the mortar blocks, battery posts and other heavy parts of the mill. With the passing years these things have undergone many changes, each being somewhat of an improvement on that previously in use, until to-day are found radical changes as compared with the "modern mill" of a quarter of a century ago. The first important improvement was to place iron liners in the mortars. These being replaceable, at once prolonged the life of the mortar indefinitely. Then the mortars were cast heavier. From a maximum of 4800 pounds, mortars were increased in size and are now cast weighing 6000 and even 7000 pounds, and, in some instances, these heavy mortars are set on massive "anvil blocks" of cast iron. The old-style solid timber mortar blocks have been replaced in new construction by built up blocks made of 2-inch planks solidly spiked together. More recently concrete-mortar blocks have found favor in some districts, and, in a few instances, massive blocks of granite have been placed above the concrete foundations, and on this the mortars have been set. These several changes have all been along the line of greater solidity and more enduring qualities in that most important part of a quartz mill—the foundations and mortars. A desideratum in mill construction is absolute rigidity, and this it is difficult to secure without massiveness, and is not always obtainable even then, if details are neglected. The tremendous vibration set up by the dropping of a battery of sixty or more 1000-pound or heavier stamps 100 times per minute, is only understood and appreciated by millmen and engineers whose task it has been to find a means of overcoming this undesirable element in mill construction. The most recent innovation in California mill building is that found at the North Star mine at Grass Valley in Nevada county, Cal., described in some detail elsewhere herein. Here the foundations are of concrete and solid masonry. The battery frame is of channelled steel and everything about it is as substantial and rigid as it seems possible to make it. The mill has been carefully designed with a view to enduring qualities and economy of operation. As this is the first large steel battery erected in California, the result will be watched with interest, and it is doubtless only the first of a large number of mills to be built on similar lines. A mill of this construction not only has the merits of solidity, but it is fire proof and will probably last as long as the mine, even if that be a quarter of a century more or longer.

THERE still remain many unsolved economic problems in metallurgy, though these are being constantly diminished by the careful experimentation of professional chemists and other. Ores of almost every known composition, no matter how complex, can be successfully treated by known methods, but often these methods are commercially impossible owing to the cost. The field of metallurgical and chemical knowledge is being searched by many competent and careful investigators who are seeking methods of cheapening known processes or hoping to devise new ones to supplant the old. Success has attended these efforts in the past and much increased knowledge may be anticipated in the future, both in the chemistry of metallurgical processes and in their mechanical application.

THE refusal of over 400 Japanese who were recently landed at Santa Rosalia, Baja California, under contract, to abide by the terms of their agreement with the Boleo Copper Co., presents an interesting complication. The mines are in Mexican territory, the owners are French, and the refractory laborers are Japanese. As the company advanced transportation and other expenses, the authorities have interfered to compel obedience.

## Revival of Interest in the Comstock.

The success attending the work of drainage of the middle section of the Comstock lode at Virginia City, Nev., by means of the hydraulic elevators placed in the C. & C. shaft, has led to the serious consideration of a second attempt in this direction in relation to the mines at the south end at Gold Hill. These mines had been flooded to the Sutro tunnel level for twenty-five years or more until the lowering of the water in the C. & C. shaft showed its influence all along the line. The zone of saturation at present is approximately that of a concave oval, with its lowest plane just below the 2350 level of the C. & C. shaft. At the Combination shaft, sunk in the hanging wall, and several thousand feet distant, the water is 200 feet below the Sutro tunnel level, but is 400 feet higher than at the C. & C. shaft. In the Gold Hill mines the water is higher still, but somewhat below the tunnel level. It is proposed to install an elevator in the shaft of the Alta mine, which will be equipped for the purpose, and it is thought in this manner the Gold Hill mines can be unwatered to the bottom about 3000 feet. It is believed that most of the old excavations are caved in these long flooded mines, and no great rushes of water are anticipated. Work in the lower levels of these mines was brought to a standstill when a rush of water from the Exchequer mine flooded the adjacent properties with hot water, driving the miners out, who barely had time to escape. The volume of water from that source has never been determined, but the hydraulic elevators have long since proven their efficiency in handling a large volume of water, and an installation of this kind at the Caledonia shaft would probably result in a renewal of activity in these long abandoned mines.

## CONCENTRATES.

THE condensing engine will need twenty-five gallons of water to condense the steam evaporated from one gallon of water.

MILL shafting should be examined frequently to see that it remains in alignment. When shafting gets out of line it greatly increases the friction of running the machinery, and it usually causes the babbling of the boxes to cut.

It is stated that when the peasants in the Baku oil region of Russia desire to make lime they pile limestone over one of the many vents of natural gas found in that section and apply a torch, and the limestone is converted into caustic lime at no further expense.

WHERE ores are coarse—carrying sulphides in comparatively large crystals or masses, rather than in finely disseminated grains—rolls and jigs are often more satisfactory than stamps and concentrators, these latter being better adapted to the ores containing the finely disseminated sulphides.

THE new camp of Goldfields, in Nevada, is about 25 miles from Tonopah in a southerly direction. There are three separate camps there, mostly tents. The prospects extend for a distance of about 4 miles, and there are a number of veins on which good ore has been found. Some of the ore is very rich in gold. It is stated that in one shaft, down 300 feet, water and sulphides have been encountered.

It is thought by electrical engineers that the limit of high voltage in electrical transmission is rapidly being approached, with the present insulating system and devices. With currents running at 60,000 volts and over, when switches are suddenly opened or closed in high tension plants, it is said the insulation is practically worthless momentarily, owing to the destructive discharges of the subtle fluid.

THE first mechanical rock drill was introduced in the United States in 1838, and was called the "drop" drill, from the fact that it was employed in cutting "down" holes, the drill being raised by a cam something like the stamp and allowed to drop. Later springs were attached to increase the force of the blow. The first drill approaching the modern construction was the Burleigh, which was operated by steam.

A CROOKED SHAFT is never satisfactory. It causes hoisting ropes to become more quickly worn. It interferes with the expeditious handling of ore, men and materials, causes delays and difficulties when putting in pipes, etc., and is for numerous other reasons less desirable than a straight shaft, even if the latter costs more. It is not always the most economical practice to seek for and follow the softest ground in sinking.

THE temperature of saturated steam in a boiler varies greatly with the pressure. Thus, when the absolute pressure is 10 pounds per square inch the temperature will be 193° F.; at 30 pounds the temperature is 250°; at 60 pounds the temperature is 292.5°; at 100 pounds it is 327.6°; at 150 pounds it is 358°; and at 200 pounds, 381.6°. These figures are theoretical, and in employing steam in pipes for heating or drying purposes considerable allowance is necessary for radiation, etc.

"AMPLIACION" in Mexican mining parlance means an increase in the number of claims or pertenencias previously taken. To secure this increase in claims the owners of the claims must subject themselves to proceedings similar to those provided for applications for concession. If this increase is made after publication of the summary of the previous filing, the first must be withdrawn and the new application substituted in its stead.

THE cyanide treatment of slimes is in each individual case a separate problem within itself. The determination of the best process to adopt can only be arrived at by experiment. Some slimes are readily treated by decantation, and in other instances this method fails to produce commercially successful results because of the time required. Filter pressing works well with some slimes, but this method does not find favor in the handling of some ores, though probably it is more generally applicable than the decantation method.

PETROLEUM OIL occurs in sands and shales, saturating these rocks. Its presence is not always denoted at the surface, as the strata containing the oil at the outcrop may be covered by debris to such a depth as to effectually hide the signs of oil seepage. Usually the oil occurs most abundantly in the crest or dome of anticlinal folds, though also occurring in strata of slight, but practically uniform, dip. Where the strata are flattened and along the lower portions of the anticlines, there is a greater likelihood of finding water rather than oil.

NEITHER steel nor iron will rust in the presence of dry air, but water in the presence of air will cause rust. It was formerly thought the presence of carbonic acid

was also necessary to cause this oxidation to take place, but it has been found by experimentation that the latter is not absolutely necessary. Steel oxidizes more readily than iron. Blued surfaces of either iron or steel is less quickly attacked by rust than bright surfaces that have been planed or otherwise mechanically polished. The formation of the blued surface during the manufacture of the bar or pipe seems to protect it from oxidizing influences.

RUBBER HOSE used under steam pressure will last a long time without serious leaks about the coupling joints if the steam be kept turned on continually, but if shut off and the hose allowed to cool, the iron or brass couplings contract while the hose shows scarcely any contraction, and when the steam is again turned on a leak will usually appear at these joints, which by repetition of the process becomes more and more pronounced until the loss of pressure is so great that the hose has to be renewed. If the hose is to be used in connection with a sinking pump it would be better to put in a slip joint in the steam line.

IN establishing the character of land, as to its relative mineral or agricultural value, the United States Land Office at Helena, Mont., has recently rendered a decision which has been sustained by the Commissioner of the General Land Office at Washington, to the effect that to be considered mineral land need not necessarily have a paying mine upon it, but shall show sufficient evidence that mineral actually exists in sufficient amount to justify a person in exploring and developing it. Where the prospector considers the showing sufficiently good to locate the land and to work upon it, the land may reasonably be considered mineral.

WHEN roasting gold ores for chlorination, it is not customary to add salt in the furnace except in very small amount, as this causes a material loss of gold by volatilization. Aaron advises not to exceed 3 pounds of salt per ton of ore. When salt is added liberally—3% or 4%—the loss of gold on some ores is as high as 50% to 80%. When properly roasted, ore will assay more per ton than when raw, due to the fact that the ore loses 15% or more in weight by the expulsion of sulphur, which is not wholly replaced by an equal weight of oxygen. The amount of gold lost by volatilization is greater with a very high temperature than with a more moderate one.

TINSTONE was first recognized as such in the Black Hills of South Dakota early in 1883. The first discovery was made in the Etta mine, near Keystone, which at that time was being worked for mica. A number of heavy black minerals were sent to a competent mineralogist for determination, and among them were columbite, wolframite and cassiterite. At about the same date a miner, who was familiar with stream tin, recognized this mineral among the debris of the sluice boxes of the placer miners in the Bear Gulch region. It is stated that Richard Pearce of Denver, Colo., had previously recognized cassiterite in gravel sent him from the Black Hills, but little attention was paid to it at the time.

THE Simplon tunnel driven through the Swiss-Italian Alps has been completed, the first construction train having passed through a few days since. The tunnel is 12½ miles in length and presented numerous unusual engineering difficulties for a tunnel. Among these was the problem of ventilation. Hot springs were encountered about midway of the tunnel in the heading driven from the Switzerland side, and the heat became so great men could no longer work. The tunnel was completed by driving the heading from the Italian side. The temperature before the connection was made is stated to have been 107° F., which is not nearly so hot as the lower levels of the Comstock mines at Virginia City, Nev. The tunnel was commenced in 1898 and cost over \$15,000,000.

ALASKA is not a Territory, or at least has never been officially so considered. It is referred to as a district for all purposes in which its lands, courts, etc., are considered. It has an executive and an organized judicial system, but no legislative branch such as exists in the Territories. Congress legislates upon all matters directly connected with the district. As a consequence the Federal laws alone are applicable to affairs in Alaska, but the general land laws have not, as yet, been applied to Alaska. The following congressional acts affecting lands in Alaska are in force at the present time: The general mining laws; the coal land laws; townsite laws, and the law providing for the sale of lands for trade or manufacture; and the homestead laws, and provision for the right of way for railroads.

THE altitude of a mine has absolutely nothing to do with the geological conditions, nor with the character and value of the ore, though it may prove to be an important factor in the operation of a mine. In Alaska mines occur at sea level, descending beneath the ocean. In the interior of the United States, in California, Michigan and elsewhere mines are worked far below the level of the sea. In the Sierra Nevada mountains of California there are mines at an elevation of 11,000 and 12,000 feet. In Colorado a great many mines are above 10,000 feet, Leadville and Cripple Creek being examples. There are mines in Colorado (in Park county) at altitudes exceeding 12,000 and even as high as 13,000 feet, and there are mines in Peru, South America, at still greater eleva-

tion. Cerro de Pasco, the famed silver mining district, is at an altitude of 13,673 feet. These latter mines are now being equipped for copper production.

It is advisable to keep cam-shaft boxes in the quartz mill covered with caps, or, at least, with canvas aprons, to keep out as much dust and grit as possible, as these cause undue friction and are likely to start the boxes to cutting. In many mills the cam shafts are given but little attention, and get into very bad condition on that account. If the battery posts are not firmly set on a substantial foundation, the cam shafts are often subjected to violent vibration and the wear upon them is great under such circumstances. In cam shafts there is a tendency for the weight and friction of the tappet on the cam to thrust the shaft to one side. This is greatest just at the moment of the cam leaving the tappet. To counteract this "end thrust" the cams are made right and left handed—that is, placed on the right or left-hand side of the stamp stems—all of those dropping in one mortar of a 10-stamp battery being placed on one side and those of the adjoining five stamps being placed on the opposite side. One set tends to thrust to the right, the other set to the left, thus equalizing this tendency.

IN the case where the mill and compressor are both operated by water power from the same pipe line, and the operation of the compressor being intermittent, the water overflows at the pressure box when the compressor stops and it is desired to save this expense, a partial, if not a complete, remedy may be found in the construction of a large tank or reservoir on a level with the intake of the pipe line. This will permit of cutting down the amount of water bought, as when the compressor is idle the water required to run it will flow into the tank or reservoir and stored for use there when the compressor starts up. If a total of 300 inches are required under the present condition, of which the compressor requires 100 inches, the arrangement should make it possible to get along with 240 to 250 inches, depending on what portion of the time the compressor is idle. A tank containing 40,000 gallons should be built under ordinary conditions for less than \$400, including grading on a hillside. In figuring this matter, the maximum and minimum lengths of time that the compressor runs and is idle must be considered.

IN the cyanide vats the sulphide of antimony combines with the potassium to form sulphide of potassium, an objectionable element in cyaniding. The remaining sulphur combines with the cyanogen to form sulphocyanogen. Antimony sulphide dissolves in solutions of metallic sulphides, such as sodium sulphide, forming salts of sulphantimonious acid. Antimony is a most undesirable element to have associated with ores of gold and silver, and its treatment is a perplexing problem. When ores containing antimony are roasted, antimonious oxide is formed, which is oxidized to antimonic oxide in the presence of air, though in some cases a mixture of antimonious and antimonic oxide is produced. When sulphates are present during the roasting reactions these are often converted into antimonates, the sulphuric acid furnishing oxygen to the antimonious oxide, the antimonious oxide produced replacing the sulphur. When silver is present it will form an antimonic oxide of silver. The presence of a large amount of pyrite with the antimony aids the volatilization of the undesirable element, and if the ore does not possess this iron sulphide should be added to the charge. A mixture of a small amount of coal or coke dust with the ore will greatly facilitate the removal of the undesirable antimony, and also of any arsenic that may be present.

ALTHOUGH steel plunged at the yellow or bronze color given drills results in a much harder steel than that obtained by plunging the tool at purple or blue, the temperature of the steel when it reaches the yellow color is much lower than when it reaches the blue stage. The yellow color occurs at about 230° C. and the blue at about 300°. There is a great difference in the action and working of steel, depending upon the amount of carbon present. For drills and picks, if steel be heated to a temperature sufficient to burn out the carbon, the steel is destroyed. Many good mine blacksmiths temper steel well without the slightest knowledge of the real principles governing the action of tempering, but are successful because they "understand" it from practice and are accustomed to a certain brand of steel. H. M. Howe says in his work, "Iron, Steel and Other Alloys": "If steel of 1.1% carbon be heated to a temperature of 700° C. and then suddenly cooled in water it will not be hardened; but if it be heated to a temperature considerably higher, say 880° C., then cooled to 700° slowly and then quenched in water at 700°, it is hardened." Steel hardened at this temperature is too hard and must be "tempered." This is accomplished by reheating it to 220° for straw color for drills and 300° to 320° for blue and purple colors for picks. The picks are not nearly so hard as the drills, but this loss in hardness is the less of two evils. The harder temper of the drill will not stand the shocks to which the pick, with its small point, is subjected. The drill is much more massive and blunt, and is able to withstand the shock produced by impact with the rock. Where cold, hardened steel is reheated and plunged; the process is called tempering. When the cold steel is reheated to low red and then allowed to cool slowly, the process is known as annealing.

## Some of the Essentials of a Mine Report.

Written for the MINING AND SCIENTIFIC PRESS.

The purpose of a mine report is to furnish reliable information of commercial character to those who may be interested in the same. As usually the persons to whom the report is presented have never seen the property, it is necessary to note every fact which may in any way have a bearing upon the proposition from the economic standpoint, both in relation to mining and metallurgy. Following is an outline, or general form, which may be used in describing a mining property:

**LOCATION.**—State; county; nearest large city; nearest town; nearest railroad point and distance from same; postoffice of the mine; county seat.

**TITLE.**—This is important and should be fully investigated, if upon preliminary examination the property appears to justify further examination. It should be looked up before complete and exhaustive examination, as, if the title is not clear, the chances for selling the property will be few, if that be the purpose of the report, as investors do not like to buy a prospective lawsuit.

**SITUATION.**—Topography of country about the mine. Character of roads, if any; if not, the extent of same required and probable cost. Timber available; if no suitable timber, so state, and note where suitable timber can be had and at what cost.

**WATER SUPPLY.**—This is important and should be described in detail. If running streams, state whether or not same are permanent or only living during part of the year. Can water be obtained for power? If so, state under what conditions. Give volume of water available and under what head same may be had.

**POWER.**—This is another most important factor. State what power is available—water, electric, steam, gas engine. Give full details of either or each and cost of same; also, if supplied by a power company, what is the cost per horse power per month? If steam is necessary or advisable, give kinds of fuel that may be had and cost of each (wood per cord, coal per ton and kind of coal), or if obtainable, cost per barrel of crude petroleum.

**COST OF TRANSPORTATION.**—In isolated regions the cost of transportation both to and from the railroad is an important factor. Machinery and supplies must be hauled in, and concentrates and ore usually shipped out. Often the freight from the mine to the railroad is less than that from the railroad to the mine. State cost of both per ton, if there be any difference; also, give railroad freight from largest city where most supplies will be bought.

**TIMBERS.**—If these are to be procured at a distance from the mine, state cost per thousand feet B. M. delivered at the mine and kind of timber, whether Oregon or native pine or other timber is to be used; also, price of lumber, if there be any difference in price. If round timbers are to be used, give price. In different districts round timbers are measured differently. In some places the price is fixed by the diameter at the small end of a log, usually 16 feet in length, the price being 8 to 12 cents per inch of diameter. In other camps a stated price is paid for these logs—thus, \$2 for a 20-inch log, \$3 for logs over 24 inches, \$1.50 for logs 10 to 14 inches (stulls), etc.; at others the logs are uniform in price for all sizes. State cost of 5, 6 and 7-foot split lagging. Always state kind of timber—whether spruce, fir, sugar pine, yellow pine, etc. Spruce timbers are superior to the other kinds and, consequently, worth more. "Second-growth" timber is usually inferior to the older timbers of "first growth." All timbers used in mines should be peeled and well seasoned. Those which are not should be had at a discount, based on length of time they have been cut. Old timbers are worse than green ones.

**HISTORY.**—While the history of a mine is not usually of first importance, it is often interesting and has properly a place in a report. In this, state the date of discovery, extent and character of early operations in the mine and progress of metallurgy. Give production from various sources. Thus: Free milling, from concentrates; from shipping ores (give as nearly as possible percentage of shipping ore as related to the entire bulk of ore mined). If smelting ore, so state. In this connection give name of smelters or other custom works to which ores were sent. Always give costs of these operations if obtainable.

**GEOLOGY.**—Give geological description of the mine with sketches. State kind of rock in which vein or ore deposits occur. Note all dikes, their direction and dip, and relation to the vein. Give strike and dip of vein. If there are other veins give strike and dip of these also. In some regions the geology is of much more importance than in others. Usually the general geology of the district is of less moment than that in the immediate vicinity of the mine, and this should be studied carefully, particularly with reference to faults, dikes, and general character of the vein. State whether or not the walls or either of them are well defined, or if the ore is "frozen" on

both sides. Give size of vein—maximum, minimum and average widths and also length of pay shoots. Notice and state if the ore occurs as a "pay streak" filling part of the vein or does it fill it from wall to wall. Is there a rich pay streak in a low-grade vein? Is the ore hard or soft, oxidized or sulphuretted? State character of the walls as to hardness, and condition—slaty, schistose or massive. If the latter, are the blocks large or small. These considerations are of importance in the cost of "deadwork" usually necessary in operation of the mine. If the vein cuts across the formation this should be noted. The dip of the vein is of importance, particularly if it lies at a less angle than 40° from the horizontal. If flatter than this angle more or less shoveling of ore in the stopes will be necessary, which increases the cost of mining. Mining in a large low-dipping vein is somewhat cheaper than in a small vein dipping at the same angle.

**DEVELOPMENT.**—How is the mine opened, through shafts (vertical or inclined, in the vein or in the wall rock) or by tunnels? If the former, can tunnels be run to advantage? What depth can be reached, and whether by crosscut or on the strike of the vein. Give length of crosscut or drift probably necessary to reach pay shoot. How many openings (shafts or tunnels) are there? Make a sketch (drawn to scale) showing the mine workings.

**EQUIPMENT.**—Give full description of all the machinery, hoists, pumps, mill, smelter or other works on the property. Also enumerate all buildings connected with the mine, in the way of shops, sheds, etc., with their equipment for handling materials, making cars, skps, etc., and for making repairs. All of these things are generally necessary about a mine, and if not already provided must be added, and the cost charged to capital invested.

**THE MINE.**—As the mine, after all, is the principal thing, it must be studied from every standpoint which has a bearing on the economics of its operation. Under this head must be grouped all of importance related to the development of ore bodies, their extent, value and character. The measurement of the vein at stated distances and a careful sampling of each station is imperative to the determination of the value of the property. There is a great deal of literature on "mine sampling" and this subject is here merely referred to incidentally. The definition of the terms "positive" ore in sight, "probable" ore, and "possible" ore are well understood. Positive ore is that exposed on four sides within reasonable distances—100 feet. In this some engineers include ore cut on three sides. "Probable" ore is that cut on two sides, and "possible" ore that cut on one side. The variations in method of sampling are numerous, owing to varying character of ore bodies, but as the value of the estimate of ore reserves, and that of the probable future of the mine, depend to a great extent upon the accuracy and thoroughness of the sampling, it is important that this should be done with the greatest care. There are two main factors which form the basis of the determination of the value of a mine. These are the amount and value of the ore, and the cost of turning this ore into money. Consequently costs in every department are as essential as the ascertaining of the gross value of the mine. Among these costs, one of the most important is that of mining. This necessarily includes actual mining of the ore, timbering, filling, tramming, hoisting (including power, ropes, skips, repairs and labor), ventilation, drainage, deadwork, trackage, cars, blacksmithing, superintendence, and various incidental expenses, in addition to the general expenses, such as interest on capital invested, taxes, insurance and office expense. Each of these branches must be taken up and considered separately. Another consideration is the reduction of the ore either in stamp or other mills, or in smelters, with all of the variations in the practice of metallurgical operations which may be necessary in the treatment of the ores of the mine under consideration.

**COST OF MINING.**—In this must be considered the size and position of the ore bodies, the physical character of the ore (soft or hard), also that of the walls, and the timber required to support the walls of excavations. Filling may or may not be necessary. If required its source and the cost of obtaining same must be stated. State whether mining is to be done by hand or with machines. Here must be included cost of compressing air. On this matter the magnitude of operations has a direct influence on cost. It is manifestly cheaper to mine in a large mine than it is in a small one. There is more variation in the cost of breaking ore, as between large and small stopes, than in the other items of expense above enumerated under the head of mining costs generally, such as tramming, ventilation, etc.

**HOISTING.**—The cost of hoisting varies greatly with the depth of the mine, the extent of operations, cost of power, amount of water to be handled if the mine is drained by baling, and to some extent on the size of skip or bucket, or, if cages are used, on the size and number of cars raised at a trip.

**COST OF ORE TREATMENT.**—This is a question of paramount importance and is often the stumbling block to what otherwise might be a financially successful operation. Except in large low-grade and

free-milling mines the cost of ore treatment usually exceeds that of mining. In most cases the cost varies with the magnitude of operations and somewhat with the situation, cost of labor, power, supplies, etc. If the ore is not almost wholly free milling, then must be considered the method and cost of concentration, and possibly also the treatment of tailings by cyanide process. The concentrates must either be shipped or worked at the mine by chlorination or some other process. In the event that the ore is of the smelting sort, then arises the question of its chemical composition; the fluxes needed; the possibility of obtaining them—iron, lime and silica and their cost. Fuel (oil, coke or charcoal) for smelting, power and water are indispensable to the smelter. The transportation problem is again involved, as the fuel must be brought to the mine, and also, probably, fluxes, and crude bullion or matte shipped out. The smelting problem is a complex one and requires an extensive technical knowledge of its requirements and costs, and this is a matter which must be treated in detail. It must also be remembered that no metallurgical process extracts all of the value from the ores, 90% being high extraction in most instances.

**LIFE OF THE MINE.**—The amount of ore in sight and the capacity of works to treat it are the factors which determine the life of the mine, if development work does not increase the time indefinitely. If the mine has not reached a producing stage the report should state the length of time and expense probably necessary to place it on a producing basis. If the investment is large it is important that this condition should be reached as quickly as possible, and it is desirable to place the mine in production as quickly as possible under all circumstances.

**DISPOSITION OF THE PRODUCT.**—If the mine be a producer of any other metals or substances than gold and silver it is important that the market for the base metals—copper, lead, zinc, tin, quicksilver or other metal or mineral—be ascertained and stated, together with the costs of transportation, discounts, commissions and other charges against the same, all of which are directly chargeable to the output.

As each mine must stand upon its own footing and as there is a very wide range in the character, size, situation and magnitude of mining operations generally, comparisons are of little value except they be made with those of similar kind operated under essentially the same conditions in the immediate neighborhood. The statement that the "Noble Grand" mine has produced twenty millions in gold, and is only a mile distant from the Chancellor, may be a gratifying statement to those immediately concerned, but it adds no actual value to the Chancellor mine, which is undergoing examination for the purpose of the report. This sort of information is often embodied in a report for promotion purposes, but as each mine must stand upon its own merit, the mention of such facts concerning other mines is only of passing interest and does not even indicate the possibilities of the mine under examination. W. H. S.

## Coal and Hydrocarbons in Colorado.

Along the projected line of the Moffat road, in Colorado, extensive areas of bituminous coal, with considerable bodies of anthracite are reported in the Yampa coal field in Routt county, northwestern Colorado. The area of the coal field is estimated at 900 square miles and the total thickness of workable coal at 75 feet. Several of the bituminous coal seams are said to be from 10 to 14 feet thick, and a seam of alleged anthracite shows an outcrop of 9 feet thickness.

The anthracite is probably due to the proximity of an intrusive sheet of igneous rock which has altered the bituminous coal into an anthracitic condition near its contact. This anthracite seam is assumed to underlie a large area dependent upon its proximity to the igneous rock. For the most part the seams are approximately horizontal or with gentle dip and easily developed.

Where the coal ends there the hydrocarbons begin. The hydrocarbons consist of petroleum as yet but little developed, together with asphaltum and its forms known as gilsonite, elaterite and ozocerite. Some of these are in Colorado; some just over the line in Utah.

The total area in which the hydrocarbons occur is estimated at about 10,000 square miles. The tonnage of the five gilsonite veins, which run through portions of the country in wide veins for miles like broad paths or roads, is estimated at 32,000,000 tons, and when this elaterite is quoted at \$65 per ton f. o. b. in Utah and \$41 per ton f. o. b. in Denver, the value of these peculiar deposits seems enormous.

The gilsonite at Duchesne, Utah, is mined in a long, open trench  $\frac{1}{2}$  mile long and 90 feet deep and presents a novel example of mining.

A VALUABLE AND INTERESTING article on rope knots and fastenings appeared on pages 107 and 108 of last week's issue, the text and illustrations for which were kindly furnished by The Edward Christman Co., Massillon, O. In the article credit was given "The Edward Christian Co." The name should have been "Christman."

## The North Star Mines.\*

(FROM A STAFF CORRESPONDENT.)

The property of the North Star M. Co. extends for about a mile south of Grass Valley, Nevada county, Cal. A number of mines and mills are located on the property, but the North Star mine and mill and the Central shaft and mill are the only ones running at present, the Gold Hill being shut down, the compressors alone being run.

Electric power and compressed air are supplied to the Central and North Star from the power plant shown in the illustration on the front page.

The North Star mine was opened on the incline. The Central shaft is vertical, 1600 feet in depth, sunk in the hanging wall and connected by a raise with the North Star from the 4000 (incline) level. To keep the excess of water in the rainy season from running down to the Central, an electric pump was installed at the 1400-foot level of the North Star in March, 1904. As seen in the accompanying illustration, it is of the Aldrich type, modified by putting in extra anchor bolts to make it more solid and by making changes in the valves. It has a capacity of from 100 to 800 gallons, there being three ways of changing the capacity. In the first place it is belted to a two-speed motor, again the motor pulley is made in steps and the change is readily made from an 8-inch to a 16-inch pulley. Lastly, the suction valves may be changed so as to modify the capacity. The pump throws 325 feet.

The most important improvement recently made is the construction of a new 40-stamp mill at the Central shaft. Being of recent construction and embodying a number of new ideas, it represents an advanced type of California mill installation. Important features are the masonry foundations, the arrangement of the power, the structural steel battery posts and the plate holders.

The mill was built by the Union Iron Works of San Francisco, Cal., and was constructed to handle the output of the Central mine, which is one of the North Star properties.

The ore bins are built entirely of masonry, and the battery frame is built of structural steel, wood being practically eliminated throughout the whole plant, even to the jack fingers, which are made of steel T-bars cast into iron sockets.

The mortars are of special rapid crushing design, with extra wide bases, and are set on masonry mortar blocks.

The battery framing is arranged in two units of twenty stamps, each unit having five double posts made of heavy channel steel, which are bolted to cast iron anchor plates, the whole being securely anchored to the masonry mortar blocks by means of heavy eye bolts and T-rail anchors. The double posts are tied together longitudinally by means of structural steel guide girts top and bottom, and laterally by means of heavy cast iron yokes which perform the duty of camshaft boxes also. The entire frame is anchored at the back in a method somewhat similar to the back knee wood frame system by means of heavy steel I-beams, two to each battery post, which are embedded for one-third of their length in the solid wall which forms the front of the ore bin.

This method of construction reduces the possibility of vibration to a minimum, as it renders the batteries practically self-contained, anchoring them to the heavy walls and mortar blocks in such a way as to render them thoroughly rigid.

The power for running the batteries is supplied by a 50 H. P. motor belted to a countershaft located at the top of the front ore bin wall, the batteries being driven by pulleys of the Gibson friction clutch type, the operating mechanism of which is readily accessible in order that any part of the batteries may be shut down instantly in case of an accident or to make repairs.

The sulphurets in the new mill will be handled by eight standard 10-foot Dodd circular riffled tables, which will effect a separation into three grades—concentrates, middlings and tailings—the middlings being carried by launders to a special Dodd table and reconcentrated, and the tailings being run over a canvas plant.

The general arrangement of the masonry walls and foundations can be seen in the photograph showing the mill during construction. In making this masonry, rock from the dump is cemented together, the mixture being five of sand to one of Portland cement being poured in between all interstices. The cement is made so wet as to fill all cracks, and the whole is kept damp until it has set. Except for the floors there is no concrete in the construction. The mortar and lower ore bins' masonry foundations are placed on the solid ledge. The dump was built out to near the mill and the upper bins built on this. Some settling and cracking have naturally occurred, but can be readily repaired. All the main masonry walls are on solid rock. The mortars are placed on 8 feet of solid masonry and held in place by 2-inch anchor bolts built in solid. The ore bins are built of masonry with sloping bottoms. The front of the bins consists of iron plates held in place with I-beams built into

the wall on either side. The grizzly surface is very large, there being somewhat over 400 square feet in the two grizzlies on either side of the mill, being made up of sections, 3 feet by 10 feet, each section being supported by I-beams being built in the masonry. The cleanup and settling tanks are concrete, painted with P. & B. paint.

Electric motors are used throughout for power except for the two giant rock crushers. These are run by a Pelton water wheel and the water run into a stone tank, from which it is drawn to the batteries. It is planned to run the rock breakers during the day and utilize the power for a dynamo at night. In each case the motors are placed on masonry piers behind and above the countershafts. This throws every belt tight on the lower side, the slack belt being on top. The smaller pulley is also above and the belts lead down to the larger one.

The illustration shows the central pier between the two rock breaker piers on which a 75 H. P. 60-cycle general electric induction motor is placed. This is belted to a countershaft, which in turn is connected with the cam shaft. Leather belting is used throughout.

The amalgamating plates are placed on iron frames or holders, especially designed by Superintendent A. D. Foote for this mill. These are built up of flanges

thence the tailings are run into a settling tank. The slimes and sands are allowed to settle to the bottom and the clear water flows gently over the circumference. Lime is added to hasten settling. An air pump forces the sands and slimes from the settling tank to the solution and precipitation tank. The cyanide solution, pumped from the sump tanks and made of proper strength, is added to the pulp. A continuous circulation and agitation is produced by forcing air through a pipe up the middle of the tank, carrying the solution with it. The solution goes up the center and comes down the sides. In the bottom of the tank a series of amalgamated copper and iron plates is arranged concentrically about the center and connected to a plating dynamo of one and one-half volts and fifteen amperes. This deposits the gold from the cyanide solution upon the amalgamated copper plates, which are subsequently treated as are battery plates to recover the gold.

Experiments show that this method gives 90% to 95% extraction with the fine slimes, which carry three-quarters of the assay value of the tailings, and 70% extraction with the coarse sands. The tailings run about \$2 per ton, and the estimated cost of treatment by this method is 50 cents.

The plant for treating the tailings from the North Star mill has been installed at the lower end of the

Pump 1400 Level of North Star Mine, Grass Valley, Cal.

and ribs so as to give a table of 19 feet 8½ inches total length and 44 inches width. In its length it is supported by six cross braces, placed three on either side, and connected by two cross braces in cross-section. These are supported by feet raised from the floor by wedges so as to give the requisite slope. The concrete floor has a uniform slope of 14.6%.

In placing the amalgamating plates on the holders the edges of the plates are curved and bent over. The edges are then fastened down with brass tacks. The curve along the edges allows the plate to expand without buckling.

For cleanup purposes and for handling the shoes and dies a carriage is suspended on tracks supported in front of the mortars so as to be run above the plates. Punched steel screens, 400 holes to the square inch, are used in the battery. Wire cloth screens are placed at the end of the plates to catch the coarse material and keep it from passing to the buddles. Mercury traps are placed in the floor beneath the ends of the plates.

The cleanup room is well appointed and conveniently arranged. The mill is well lighted, both by day and by night. Windows have been placed on either side of the mill and in all vertical walls at the end. Incandescent lights have been placed wherever needed. For completeness of equipment and attention to detail this mill is one of the best in the country.

The method of cyaniding the sulphurets and tailings at the North Star mines has received considerable well-merited attention for originality of method and experimental success of working. The plant at the North Star mill will be ready for work by the middle of August, while another plant for the new Central mill is now being constructed. Until the completion of the plants, a description of the process as carried on experimentally on a working scale and an outline of the plants in course of construction will suffice. The method was introduced by O. L. Oliver. The pulp from the plates is run over Dodd buddles,

mill under considerable disadvantage as to space and arrangement because of existing conditions. As installed, the plant consists of six settlers, six agitation tanks, each of ten tons capacity, and two sump tanks. These are all built of wood and similar in design to those in the experimental plant. It will consist of three settling tanks, each of 60 tons capacity, six agitation tanks, arranged in two rows of three each, and two sump tanks. These are for treating the tailings. In addition there are to be two tanks for treating the sulphurets. These are to be ground to a proper fineness in a Chile mill. The sulphurets from the North Star mill are to be hauled over in wagons and those from the Central to be run to the plant in cars.

Grass Valley, Cal., Aug. 1.

## The Cleanup Barrel.

TO THE EDITOR:—In my paper on gold milling, appearing in the MINING AND SCIENTIFIC PRESS July 16-30, there is one point I should have explained—that is, how I come to make the barrel cleanup inside of four or five hours, instead of twenty-four, as is usual.

In order to be able to retort the next day after cleaning up the mill, I have had to devise some quick method, which is based on the following facts:

First—The sand left in the battery above the dies contains little or no amalgam. This is, therefore, returned and does not go to the cleanup barrel.

Second—The amalgam adhering to pieces of iron is only partially recovered in the barrel, as can be proved by examining such pieces after undergoing the action for a day, and can only be removed entirely after the iron has rusted. I, therefore, am not very particular how long the iron remains in the

\* See illustrations on front page.

barrel, for I put it by to rust and clean it separately, the amalgam going into the next cleanup.

Third—The tailing sand from cleanup barrel, after extraction of iron and wood, is returned to the battery, for it may still contain values.

Now, whether this is not as good practice as grinding the sand to a slime, and consequently some of the quicksilver and gold, is open to discussion.

ALGERNON DEL MAR.

### Pumping Outfit on Wheels.

The accompanying illustration shows a wagon equipped with a 25 H. P. "Union" double-cylinder stationary engine. A circulating tank is mounted on

Portable Pumping Outfit.

the wagon and an oil tank is attached underneath. The engine is fitted with a friction-clutch pulley. The outfit is used for pumping purposes. It is the property of the Cutting Packing Co. of San Francisco, Cal. The net weight of the engine, without battery, friction-clutch pulley, oil tank, etc., is 3860 pounds; the weight of the complete outfit is 6500 pounds. This outfit is made and furnished by the Union Gas Engine Co. of San Francisco, Cal.

### The Juneau Gold Belt, Alaska.

Examinations of the known gold prospects in the belt tributary to Juneau, Alaska, indicate that they are of sufficient promise to warrant all the work now in progress and the expenditure of still more capital in development work. A. C. Spencer has written a short paper on the "Geology of the Juneau Gold Belt, Alaska," which is published by the Survey in Bulletin 225, entitled "Contributions to Economic Geology, 1903."

The Juneau gold belt resembles the gold belt of California in several ways. The various rocks that occur in this southeastern part of Alaska are similar in character and partly equivalent in age to those forming the country rock of the mother lode of that State, and there is also a definite linear distribution of some of the gold-bearing veins parallel with the general strike of the bedrock formations. As in the California gold belt, however, there are many independent deposits lying outside the main complex of lodes.

Prospecting has been in progress in different parts of this belt since 1876, but the main incentive to vigorous exploration came with the discovery of the Gold Creek placer and the foundation of Juneau in 1880. The first mine to be put upon a productive basis was the Alaska-Treadwell, on Douglas island, about 2 miles southwest of Juneau. This property was opened in 1881, and it continued to grow in importance for several years, so that by 1889 it had reached practically its present rating as one of the great mines of the world. The discovery of the Klondike, however, in 1896 gave a great impetus to prospecting in the interior of British Columbia and Alaska and caused the mineral region tributary to Juneau to be temporarily abandoned as a field for investment. It may be said that only now, after seven years, has the district regained the position which it appears to have held in 1896.

A large number of properties have recently changed hands, a number of well-known engineers have been making examinations in the field with a

view to acquiring property for their clients, and there appears to be a steady demand for experienced miners. It is estimated that 1440 miners and laborers are engaged in this region, about 30% of them being engaged on development work, and indications are that the exploration of properties recently purchased by outside parties will materially increase the proportion of men engaged in work not immediately productive.

In 1903 there were seven productive mines in the district, in addition to the placers of Porcupine and adjacent creeks. These were the Alaska-Treadwell, Alaska-Mexican and Ready Bullion, on Douglas island; the Silver Queen, on the mainland opposite; the Sumdum Chief, 60 miles to the south, now worked out and abandoned; and the Alaska-Juneau and

### The Ore Deposits of Bisbee, Arizona.\*

NUMBER VI.

Written by F. L. RANSOME.

**RELATION OF PRINCIPAL ORE BODIES TO ESCABROSA LIMESTONE.**—Although the ore bodies as a rule have their greater dimensions in the planes of bedding, they are not confined to any particular bed or to any definite stratigraphic horizon. The original Queen ore body occurred in the lower part of the Escabrosa limestone. The ore in the Baxter tunnel, near the Holbrook shaft, occurs in part in the lower part of the Naco limestone. In the latter formation, also, probably occurs a portion of the ore in the Calumet & Arizona mine, and almost certainly that so far discovered in the Lowell mine. The problem of determining the stratigraphic horizon at which most of the great ore bodies of the Copper Queen and Calumet & Arizona mines occur is a difficult one. Not readily distinguishable over the quadrangle at large, the Naco and Escabrosa limestones cannot be separately identified in the mines, where metamorphism has altered the original texture and composition, obscured much of the structure, obliterated all of the fossils, and transformed both limestones to similar aggregates of silicates and pyrite. When upon such metamorphism there is further imposed widespread alteration into limonitic clays and oxidized ore, the possibility of distinction between the two original limestones vanishes. Structural relations render it very probable that the great ore-bearing member of the Paleozoic series is the lower Carboniferous or Escabrosa limestone with a thickness of about 700 feet. More exact and assured conclusions might be drawn from general structural relations as interpreted in the structure sections, were there less local disturbance in the beds, were the presence and effect of faults in the limestones more readily determinable, and did the underground workings afford some direct check on the deeper structure as projected from studies on the surface. The probability, however, is strong that the Escabrosa limestone, while not the only ore-bearing formation, is the one that contains most of the great known ore bodies in the Copper Queen and the Calumet & Arizona mines.

Facts lending some additional support to this hypothesis are (1) the known occurrence of the original Queen ore body in the Escabrosa limestone; (2) the greater depth at which other ore bodies were subsequently discovered southeast of the Queen incline, suggesting that they were formed in the same limestone as the Queen ore body, but occur at a lower level, because that limestone had been dropped prior to the general mineralization of the Czar fault; and (3) the progressively increasing depth at which large ore bodies are encountered in developments pushed toward the southeast. The correspondence between the increasing depth of the larger ore bodies and the

### Triumph Steel Belt Conveyor.

Herewith is illustrated a steel belt conveyor made entirely of iron and steel, of any size and length desired, for conveying ore, coal, crushed stone, clay,

Steel Belt Conveyor.

marl, castings and similar materials. There is a steel sprocket wheel at each end fastened to steel shafts; at the front end are stands with take-up boxes. The drive end has steel countershaft with gears and drive pulley. On each link is a saddle attachment for supporting the steel belt, which is made in sections 24 inches long, one end fastened to the saddle attachment, the other end so fastened as to move forward and back, allowing it to pass the sprockets at the end, these pieces of steel thus forming a continuous steel belt or troughing conveyor. It is manufactured by the C. O. Bartlett & Snow Co., Cleveland, Ohio.

THE Lake Superior Mining Institute held its annual summer meeting at Ironwood, Mich., this week, proceeding thence to Milwaukee, Wis. Among the papers presented were: "Titanium and Titaniferous

augmenting thickness, from northwest to southeast, of the overlying wedge of relatively barren Naco limestone, while it cannot be shown to be exact, is at least roughly demonstrable and can scarcely be a chance coincidence. It contains a strong suggestion that the maximum deposition of ore in the general zone thus far exploited was directly connected with the Escabrosa formation.

**RELATIONS OF THE ORE BODIES TO STRUCTURES OTHER THAN BEDDING.**—Bedding planes are not the only elements of geological structure that have influenced the deposition of ore. In the deeper workings of the principal mines, particularly of the Calumet & Arizona, there is a well-marked and significant tendency of the original pyritic impregnations to concentrate along minor zones of fissuring and shearing

\* Abstract Professional Paper No. 21, U. S. G. S.

in the generally mineralized limestone. This tendency, clearly shown on a small scale, usually below and at a little distance from the main ore bodies, is not merely a minor phenomenon, but illustrates in miniature what has taken place on a much larger scale in connection with the great ore masses. In the case of the latter, however, the important part played by fissures in ore deposition is to a considerable extent obliterated by later changes wrought in ore and country rock by general oxidation and secondary concentrations. Inspection of the generalized map of the underground workings of the Copper Queen mine shows that the horizontal distribution of the ore bodies is related to certain structures that are nearly vertical. These are the Czar and Dividend faults and the main limestone-porphry contact. The ore bodies on the whole constitute a broad belt, about 900 feet in width, which, beginning (so far as present explorations show), at a point about 2000 feet southwest of the Czar shaft, continues northeasterly, chiefly along the southeast side of the Czar fault to the Czar shaft, thence southeasterly along the southwest side of the Dividend fault to the contact with the Sacramento Hill porphyry. Here the ore belt swings to the south, skirting the porphyry mass toward the Spray and the Calumet & Arizona shafts. Whether it continues to skirt the porphyry eastward, past the Gardner and Lowell shafts toward Mule gulch, is yet to be proved by underground work.

The Czar fault is a well-established, but remarkably inconspicuous normal dislocation, with an estimated downthrow of about 500 feet to the southeast. The identification of the fault in the underground workings is unsatisfactory. The drift from the Czar shaft to the Queen incline on the second level ought to cut across the fault. It does in fact cross two distinct fissures, one about 300 feet from the Czar shaft, striking north 35° east, and dipping northwest at an angle of 70°, and another about 110 feet east of the bottom of the Queen incline. The latter is nearly vertical and has a local strike of about south 10° west. This is possibly the Czar fault, although the strike as observed in the short exposure in the drift is too southerly for the general trend of that dislocation. The long crooked drift running southwest from the Queen incline on the second level probably crosses and recrosses the Czar fault. It was found impossible to identify the fissure, however, owing to the prevalent decomposition of the disturbed and altered limestone to the soft, ferruginous, clayey material known as "ledge matter." In general, the fault seems to separate extensive areas of this "ledge matter," containing large ore bodies and extending eastward toward the Holbrook shaft, from harder less mineralized limestones on the northwest, in which no important ore bodies have yet been found on this level. It is probable, although by no means certain, that the "ledge matter" on the southeast of the supposed fault line is altered and decomposed Escabrosa limestone, and that the harder limestones on the northwest is Martin, or perhaps in part, Abrigo limestone. The stope worked for converter clay in this part of the mine is probably in altered limestone. If the foregoing interpretation of the structure is correct, it affords a reasonable explanation of the failure to find ore bodies on this level on the northwest side of the supposed fault line. For it is evident that the bottom of the particular limestone, probably the Escabrosa, that carries the ore on other parts of the level, must be sought for above this level on the northwest side of the fault.

It was probably in consequence of the Czar fault that so much difficulty was encountered in finding new ore bodies after the exhaustion of the original Queen stope. That great cylindrical ore mass was on the northwest side of the Czar fault, while the bodies afterwards discovered at lower levels have been in the downthrown southeast block.

The detailed relations of the ore bodies of the Copper Queen to the Dividend fault are very obscure. Large bodies of ore have been mined and are still being worked in the vicinity of this great fissure, but the ground is soft and openings in it very difficult to maintain. Such crosscuts as have been run northeasterly beyond the ore bodies are no longer accessible, and it is not known whether any of them penetrate the schist, which at the surface forms the country rock northeast of the fissure. The ore bodies in this part of the mine were apparently formed for the most part in limestone, but the mineralization and subsequent alteration has been so intense that very little of the original country rock can now be identified. Masses of earthy oxidized ore and bodies of crumbling pyrite, more or less enriched with chalcocite, occur very irregularly amid abundant soft clayey and limonitic material. The general parallelism of the ore bodies with the bedding planes of the limestone, elsewhere in these mines a noticeable feature, is much less distinctly shown in these workings near the Dividend fault.

(TO BE CONTINUED.)

A GRAVITY TRAMWAY near Hedley, B. C., is 9000 feet in length, with a difference in elevation between the terminals stated to be 4000 feet. An electric train runs from the head of the tramway, a distance of 2 miles, into the stopes of the mine known as the Nickel Plate.

### The Akron Chilian Mill.

The accompanying cut illustrates the Akron Chilian mill, designed and built by the Webster-Camp & Lane Division of the Wellman-Seaver-Morgan Co., Cleveland, Ohio. In the construction of this mill attention has been devoted to substantial construction

The Akron Chilian Mill.

combined with easy accessibility to the wearing parts, convenient means for adjusting rolls, evenly distributed and steady feed, large screen capacity, free discharge. The manufacturers say: "Among the noteworthy constructional features embodied in the mill are the following: Vertical adjustment of drivehead and rollers, the adjusting mechanism so arranged that they may be lowered or raised while the mill is in operation, by means of a hand wheel conveniently located outside of the sub-base. Hence the location of the rollers in reference to die can be readily varied at any time, and the revolving parts can be lifted to facilitate starting the mill after being stopped with a charge in the mortar. The main drivehead is provided with roller bearings so located as to receive either upward or downward thrust. An efficient method of lubrication is effected by an oil cup located directly over center of the driving shaft. The oil passes from this cup to cavity in top of the shaft, and is conducted to a point directly over the outer surface of the hollow spindle, the top of this spindle being chamfered so as to form a groove between it and the inner surface of the drivehead. This groove catches the oil as it drips from the pipe, and it is then conveyed to a circular groove in upper end of the spindle bearing, where it is held in sufficient quantity to thoroughly lubricate this bearing. Separate provision is made for oiling the lower spindle bearing."

"Each roller bearing is provided with three grease

cavity, from whence it is drained into the inside and through bottom of drivehead.

"In order to entirely remove the pulp from the mortar, a drain is provided from the inner edge of the mortar, having an outlet underneath the launder, this outlet being closed by a plug except when the mortar is to be drained.

"The spindle and the trunnion bearings are very

large, insuring rigidity of mill and smoothness of operation. The center of gravity of rollers is so located that the centrifugal force developed adds to the crushing effect. Increased capacity is obtained by increased size of screen openings and by making the bottom of the launder with semi-circular cross section instead of flat, thus allowing greater capacity with the same amount of water.

"The mill is under driven and is equipped with three rollers, fitted with heavy tires of forged steel running on a forged steel die. Driving gears are of cast steel, heavy pattern. The mill is provided with tight and loose pulleys, and can be equipped with Pitkin patent friction pulley if desired.

"The housing is made in sections, held together by hinged bolts which permit a section to be thrown back without entirely removing it from the mill. The screen area is exceptionally large. All working parts of the mill are readily accessible, facilitating inspection and repair."

Other details will be promptly furnished upon application to the manufacturers.

### The Atlantic Steam Shovel.

Ten years ago the standard railway shovel weighed 25 tons and carried a dipper of 1½ cubic yard capacity. The shovel of to-day weighs 60 to 70 tons and has a dipper of 2½ to 3½ cubic yards capacity. Shov.

The Atlantic Steam Shovel.

cups, and to prevent the oil from reaching pulp which may be contained in the body of the mortar the roller shaft is provided with lips which arrest the outward flow of the oil and direct it to cavities from which it may be readily drained. To prevent oil from working its way along the roller shaft to inside of the rolls and thence to mortar, an oil thrower is turned on roller shaft which throws the oil into a

els are in use which weigh 90 tons and carry a dipper of 5 cubic yards capacity. More weight and size, however, do not give efficiency in service. Great weight, which is necessary in a locomotive, is a disadvantage in a steam shovel, because it not only makes it cumbersome and difficult to hold on temporary rails and soft ground, but makes it slow of movement. The steam shovel illustrated herewith is a new

machine, now being introduced by the Atlantic Equipment Co. of 25 Broad street, New York. It is built by the American Locomotive Co. from designs by A. W. Robinson, member of the American Society of Civil Engineers. This machine is the result of many years' experience in the design and operation of steam shovels and dredging machines.

The steam shovel has become an indispensable machine to railroad companies and contractors engaged in construction work, who realize that the best results are secured by the most efficient appliances. The work which the steam shovel is called upon to do is probably the most severe and exacting of any mechanical appliance. A good shovel must be quick in its movements, easily handled and very strong in all its working parts, and constructed so that it cannot get out of order with any kind of handling.

The shovel illustrated is one in use by the New York Central & Hudson River Railroad. It is a class 38-16-2½ machine. This means a shovel having a pull upon the dipper of 38,000 pounds, a clear height of lift of 16 feet and a capacity of 2½ cubic yards. This system of numbering is designed to express any combination of these three elements in a shovel. Another shovel of this size is at work on the new Pennsylvania Railroad terminal excavation, New York City.

What may be considered the distinguishing feature of this shovel is the direct wire rope hoist, which has been used successfully by Mr. Robinson for some years in large dipper dredgers.

The Atlantic shovel has a special advantage where high lift is required.

The illustration shows that the hoisting engines are incorporated in the base of the boom, so that the whole hoisting machinery revolves together. The drum is very short, of large diameter, and fits easily between the sides of the boom which constitute the frame.

The A frame is made of solid steel bars having solid forged pin connections at feet and a cast steel head. It is stepped upon the ends of the jack-arm truss, in such a way that it forms a continuation of the jack-arms, giving stability and relieving the car frame from strains.

The boom has a straight taper, deepest at the inner end. The upper members of the boom are steel channels set vertically, the lower members set horizontally. The web is a solid steel plate.

The main engines are of locomotive type, with outside cylinders. A sheet steel casing is provided for protection. They have solid cast steel frame for both engines in one piece and steel crossheads, with all parts easy of access. Steam is carried by a pipe having a double ball and socket joint on top center, and the exhaust is carried to the smokestack by a pipe through the bottom center.

The hoisting drum is of large diameter, grooved for steel wire rope. There are two parallel ropes, each bearing half the load, equalized round a small sheave or thimble at the dipper. The two ends of the rope are secured by clips at the drum. The cost of renewal of a steel rope 1½ inch diameter, 108 feet long, is about \$40.

In the construction of the dipper Mr. Robinson has discarded the bail and sheave and attached the double hoisting rope directly to the back of the dipper in such a way that the lines of force meet in a point situated in the plane of the resistance, or in line with the strain applied to the teeth.

The shovel is mounted on two all-steel trucks of diamond pattern specially designed for the purpose. The axles are of best hammered iron, with M. C. B. standard axle boxes. The bolster is formed of a steel box girder composed of two 9-inch I beams, with steel plate top and bottom. The main arch bars are 6 inches wide. The rear truck is fitted with hand brakes.

Coal and water supply is amply provided for by water tanks of large capacity and a coal platform attached to and projecting from the rear of the shovel. This coal platform is built entirely of steel and is hinged in such a way that it folds up against the rear of the machine when not in use.

### A Modern Coal Cutter.

In some coal chain undercutters only a small portion of the working time is utilized in cutting, the remainder being consumed in withdrawing the machine from the cut, setting and resetting, and getting the machine across the face into a new position. Such conditions waste time and contribute toward trouble, for unless great care is exercised the cuts may be put in at different heights, thus making an uneven floor and leaving bottom coal to be lifted; or a rib may be left between the cuts, making the coal difficult to excavate.

The electric chain machine, manufactured by the Sullivan Machinery Co., consists of the following principal parts (see Fig. 1):

(1) A bar, on which a cutter chain moves in a horizontal plane, the chain consisting of links, in which steel cutters are mounted;

(2) An electric motor, providing power by which the chain is operated by means of gearing;

(3) The bar and chain with motor are mounted on a frame which supports it while cutting the coal and

while being moved about the mine, and the frame with other main parts are mounted on another frame called the pan.

The machine itself makes the first or "tight" cut in the ordinary manner, except that the feeding is done by means of a chain instead of a rack and pinion. After the first cut is finished the back end of the frame or pan is detached (see Fig. 2), the feed

blasting of the coal, thus requiring the minimum amount of powder and increasing the percentage of lump coal (see Fig. 3).

The machine cuts close to the bottom, leaving practically no bottom to be taken up. By means of a taper skid or by raising or depressing the feed chain, sharp irregularities may be followed. The machine will follow ordinary rolling bottom without

Fig. 1—Sullivan Electric Chain Machine, Showing Position at Middle of "Tight" or Corner Cut.

Fig. 2—Sullivan Electric Machine, Showing "Pan" Detached and in Position at Starting of Side Cut Across the Face.

Fig. 3—Sullivan Electric Machine Cutting Across Face

assistance. Timbers may be set about 5 feet from the working face, being about one-half the distance required for the breast machines, insuring the safety of both machine men and loaders. Owing to the continuous nature of the cut and the method of setting the jacks, there is no vibration to affect a weak roof. The machine propels itself by power to any desired position in loading or unloading and in moving about the mine.

The machine will operate on any pitch up to 30°, when rooms are driven across the pitch; it will work straight up the pitch, providing this does not exceed 12°.

The motors are of the multipolar, vertical, shunt wound, direct-current type, built for 210, 250 and 500 volts, and the machine will undercut to 5, 6 or 6½ feet. The armature is drum wound, with formed coils imbedded in the slots; it is built on a separate

Fig. 4.—Sullivan Long Wall Machine in Position for Cutting.

chain is anchored in the left corner of the room, and the machine is then started at cutting sideways from right to left across the room, not stopping until the breast is completely undermined. After the room is undercut completely, the machine is loaded by its own power upon a mule or power truck for moving about the mine.

As the machine makes a continuous cut, it leaves no stumps or sprags to interfere with the proper

sleeve, making the shaft removable. The motor is especially designed for this machine. A ventilating fan and ball bearings decrease friction and heating and increase efficiency. The controller connections are mounted on a slate base. The reverse switch is interlocking, and the current cannot be reversed when the machine is in operation. The rheostat is made of laminated iron punchings with mica insulation and is practically indestructible from burn-outs

and grounds. The main frame and pan described support the motor, gearing and cutter bar, and are connected by gibs. The feed mechanism is driven by a friction clutch, adjustable by spring and nut, which slips when unusual strain is brought upon the cutter chain; as when sulphur or other hard substances are encountered. The cutter chain is of a new type, of the link and strap pattern, with liberal dimensions, running in close gibbed guides.

As will be noticed from the illustration (see Fig. 4), the machine slides along the floor of the mine on a sheet steel shoe, requiring no heavy and cumbersome rails, and it will work in little space both as regards height and distance between face and props. The advance or feed of the machine is effected by a driving sprocket engaging with a chain securely fastened some distance ahead of the machine, and stretched parallel to the face of the coal. As the machine advances, the slack in the chain is taken up by the back chain; that is, the chain is in one continuous piece, and as the machine advances the slack is fed out at the rear end, by means of which the machine is always kept up to its work and at the proper angle to the face of the coal. Should it be necessary to alter the angle of the machine with the face of the coal, the tension on the chain may be changed by the ratchet at the back end of the chain and the machine made to assume any desired angle with the face. This machine is driven by electricity, and, with the exception of the changes mentioned, otherwise conforms to the electric chain machine. The motors are wound for 210, 250 and 500 volts direct current, and the machines are built to undercut up to 5 feet deep. To illustrate the capacity of these machines, it may be added that one of them has a record of 500 feet, with a 5-foot undercut in an eight-hour shift, in very hard coal. This was in the mines of the Bolen-Darnall Coal Co., at Craig, I. T., in a vein pitching at an angle of 24°.

These machines are fully described and illustrated in a special catalogue, which may be had on application to any of the offices of the manufacturers, the Sullivan Machinery Co., main office, Railway Exchange, Chicago, Ill.

### Placer Mining in Colorado.

[FROM A STAFF CORRESPONDENT].

For the past forty years the placers around Breckenridge, Colo., have been worked in a primitive and ineffective manner. The past few years many improvements have been made. There are probably 50 square miles of good placer ground within a radius of

9 miles of Breckenridge along the valleys of the Blue river and its feeders. One of the most noted of these placers is the one owned and operated by the Gold Pan M. Co. This company owns 1700 acres of patented placer ground, commencing at Breckenridge and extending up the Blue river for 7½ miles, with an average width of 1000 feet.

The plant of this company, which is illustrated herewith, consists of a ditch 8 feet wide on the bottom, 4 feet deep in the solid and 12 feet wide on the

top, having a capacity of 7000 miner's inches, is taken out of the Blue river at a point about 4 miles above the lower portion of the placer and is brought along the hillside 2½ miles. This is succeeded by a pipe line 8000 feet long and 5 feet in diameter made of steel boiler plate varying from  $\frac{3}{8}$  to  $\frac{7}{8}$  of an inch in thickness. (See illustration).

The outlet of this line is connected with a system of Evans' hydraulic elevators, which will work down to bedrock 70 feet below the surface, discharging the material 20 feet above it, making a total lift of 90 feet. The gravel passes through elevated sluice boxes equipped with riffles. The water through these elevators operates under 350-foot head, at a static pressure of 150 pounds per square inch.

The material is handled by Evans' patent carrier ways. Derricks for this purpose are made of steel lattice girded work and are 110 feet high, capable of handling at each trip three tons of small boulders or other material, making the round trip of 1000 feet in one and one-half minutes. The plant as now equipped has a capacity of 2000 cubic yards in twenty-four hours.

### THE PROSPECTOR.

Within the week the press dispatches contain the news of the death of several miners in southeast Arizona, who returned to the face of a drift to ascertain why several of a series of blasts had failed to explode. As is too often the case, they arrived at the time that the belated shots exploded. If several blasts out of a number which have been spit fail to explode, give them plenty of time. Defective fuse sometimes hangs fire an hour or more, while the tape slowly burns through a section of the fuse which is without powder or is otherwise imperfect.

Float always works down hill, never up hill. If you are searching for a vein or deposit from which you have discovered the float, continue to search up the hill as long as a fragment can be found. Often the mistake is made of working where the float is most abundant. This is sometimes the proper thing to do when the ledge comes close to the surface; but, if it be buried beneath the rock slide and alluvial, it will be found that the outcrop is above the float, appearing at the surface, and the flatter the slope of the hillside the more distant will it generally be.

The mineral specimens from Kasaan, Alaska, are: No. 1. Quartz diorite, with disseminated copper sulphide. No. 2 is an aluminous rock stained with iron and manganese oxide. It may be from the wall of a vein or from a fissure in the rocks.

The mineral from Midas, Nev., is pyroxene, a meta-silicate of calcium, magnesium, iron, etc. The composition is variable.

The two samples of blue ore from La Sal district, Colorado, are azurite, blue copper carbonate. The samples sent are of good grade—over 30% copper.

## Tin Deposits of the York Region, Alaska.\*

NUMBER II.

Written by A. J. COLLIER.

On Tin creek, which enters Lost river from the east about 4½ miles from the coast, a large body of granite was found intruded in the limestone. This granite outcrop is believed to be nearly circular in outline and probably ½ mile in diameter. Around its margin the limestone was found to be considerably altered, and some small dikes of fine-grained pegmatite were found cutting the limestone, apparently parallel with the contact of the limestone and granite.

In Tin creek, which flows for some distance along this contact, many boulders and pebbles, some of considerable size, were found to contain minerals, which are the result of contact metamorphism.

The main tin-bearing ledge outcrops nearly half a mile north of this granite boss. It is a white, porphyritic dike, cutting the limestone, and striking nearly east and west. It has been traced from Tin creek westward across the mountain to Cassiterite creek, a distance of about 1 mile, but has not been found beyond these streams in either direction. All of this rock has been more or less altered, so that it is practically a greisen having crystals of cassiterite disseminated through it. Specimens collected near Tin creek appear, in the hand specimen, to be a white aplite or porphyry with some small spots and large patches of purple. Under the microscope many of the original minerals are seen to have been replaced by fluorite, to which the purple color is due. Pseudomorphs of fluorite take the place of most of the feldspar crystals and of some of the quartz grains. In specimens which are still more altered, collected from the same dike, near Cassiterite creek, probably very few of the original minerals remain. The rock here is found to consist of calcite, fluorite, lithia mica, and quartz, proportioned in the order named. The limestone, on the south side of the dike, is altered for several hundred feet, and contains many greenish minerals, among which epidote and garnet have been identified. The limestones north of this dike are reported to contain many small stringers of tin ore for several hundred feet. The ore obtained from the main ledge varies considerably in general appearance and character. Some of the weathered ore from the outcroppings is highly siliceous, and has the appearance of weathered, iron-stained vein quartz with small black cassiterite crystals disseminated through it, while other specimens show clearly their granitic origin and contain comparatively little vein quartz. In the ore of the latter type the cassiterite occurs both as disseminated crystals varying in size from that of a pinhead to that of a walnut and as veinlets and irregular masses. The granitic ore consists principally of calcite, fluorite, quartz, and large crystals of lithia mica; and in addition to the cassiterite, tourmaline, topaz, pyrite, garnet, and galena were observed in small amounts. In the float of this dike large specimens of galena, wolframite, and some malachite were collected, and in the altered limestone near the contact some large specimens of garnet were obtained. The siliceous ore mentioned above, when examined with the hand lens, sometimes showed spangles of free gold. Among the loose material from the croppings of the ledge a large piece of galena, coated with yellowish alteration products, was found. This may have come either from the ledge or from the altered limestone near the contact. An assay shows that it contains 0.08 ounce of gold and 7.76 ounces of silver per ton. Both on Tin creek and on Cassiterite creek tin ore in angular, unworn crystals is reported to have been found in the gravels of the stream beds. One specimen of placer tin of this kind obtained near the croppings of the large dike on Cassiterite creek consists principally of crystals of cassiterite, but contains also wolframite and garnet.

The tin-bearing dike is readily followed from Cassiterite creek eastward over a mountain having an elevation of about 1000 feet to Tin creek, a distance of about 1 mile. At the time the ledge was examined, in the latter part of July, 1903, no excavation had been made on it, and it was impossible to measure the exact width at any point, but surface debris indicated a width of about 100 feet. Since that time crosscut trenches have been made on the ledge near Cassiterite creek, and the above estimate is reported to represent the facts. The cassiterite was found to be distributed through the whole width of the dike.

Tin ore in the form of stannite or tin pyrites has been found on Tin creek at the upper contact of the large granite area which has been described, and about half a mile below the cassiterite ledge. Specimens of mineralized granite were collected at this place, which, on examination in the laboratory of the Survey, are found to contain a small amount of tin in the form of stannite, together with other sulphide minerals.

CAPE MOUNTAIN.—Cape Prince of Wales, the most western point of Seward peninsula, is marked by a high peak known as Cape mountain. At the south-east base of this mountain a settlement called Tin City has grown up within the last year. From the

summit of the mountain, East cape and other points on the Asiatic coast, 60 miles distant, are plainly visible on clear days. On its west and south sides this mountain slopes down to bluffs that drop perpendicularly into the sea.

The greater part of the York region is occupied by the York plateau, which is from 200 to 600 feet above the sea and is a result of erosion occurring during the period in which was produced the bench described in connection with the Lost river deposits.

This plateau is trenched by the streams which drain the region, and the valleys have V-shaped cross

## Progress Around Reno.

Written for the MINING AND SCIENTIFIC PRESS by SAMUEL C. WIEL.

Many of the important interests of Nevada are within a day's drive of Reno, and many of the permanent interests are there. Virginia City and Carson City have retained their importance while many other places have risen and declined. It is a well known characteristic of Nevada that the center of interest shifts irregularly with the discovery and exploitation of new mining districts; yet the region

Mill of Reno Star Mine, Sparks, Nev.

sections, characteristic of newly established drainage. At the base of Cape mountain, which rises to an elevation of 2300 feet, the York plateau has an elevation of about 300 feet above the sea. The interbedded schists and limestones above described form the bedrock of the plateau surface surrounding Cape mountain, but the mountain itself is composed almost entirely of a granite boss intrusive in the limestone. The contact relations of the granite and limestone have not been studied in detail, but from data gathered in the hasty reconnaissances it appears that the granite cuts across the bedding of the limestone.

At the time of the writer's visit to this locality, specimens of tin ore were obtained from surface debris, which undoubtedly came from the surface of

around Reno has been of a constant importance through these changes. Engineering and the application of water power from the Truckee river has been the marked feature about Reno. Most notable is the plant located at Floriston. There are substations at Reno and Carson City, while Virginia City is now lighted from top to bottom, from the surface to the 2300-foot level of the C. & C. mine.

Mining about Reno has not equaled in importance the progress in industrial engineering. Prospecting in the hills about Lingley gulch is being carried on with some results. The only large mining development in the vicinity of Reno was that undertaken at the Reno Star (see accompanying engraving). This mine is largely owned by Governor Sparks of Ne-

Shaft of the Reno Star Mine, Sparks, Nev.

Irrigation Ditch Crossing Reno Star Mine, Sparks, Nev.

the mountain, though the ore was not definitely traced to its position in the solid rock. It is reported that tin ore has been found in three distinct places on this mountain, and that it occurs in somewhat irregular deposits which have an east-west trend. Several short tunnels have been driven into the mountain, but are reported not to have reached any ore bodies. The granite from some of these tunnels is partially altered to greisen, and justifies the belief that the ore bodies may be not far distant.

The ore obtained at Cape mountain differs in general appearance from that seen at Lost river. Large pieces of nearly pure cassiterite, one of which weighed fully 9 pounds, are said to have been found on the surface of the mountain. A specimen which the writer obtained weighs nearly 2 pounds and is nearly pure cassiterite, showing few crystal faces, but embedded in it and surrounding it are long, slender needles of tourmaline.

(TO BE CONTINUED.)

vada, and is situated near the new town of Sparks. The surface improvements have been extensive. The mine is down 350 feet. But little work is being done at present. A curious illustration of the diversity of interests in the vicinity of Reno is shown by the large irrigation ditch which runs over the surface of the mining claim, crossing it just in back of the mill, to supply the ranches beyond. The use of the Truckee river for irrigation is likely to do more for Reno than anything else. It has been shown by Dr. Taylor in a Bulletin of the University of Nevada, published in 1902, that the whole of Nevada cannot possibly be reclaimed by irrigation. Nor can any very great fraction of it. The total possible water supply is too absolutely limited. The very small rainfall and the limited drainage areas are not enough to go around. But of the available water, the best supply is that from Lake Tahoe and the Truckee river, from which Reno is more likely to benefit than any other part of the State of Nevada.

# Mining and Metallurgical Patents.

PATENTS ISSUED AUGUST 9, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS

METHOD OF RECOVERING VALVES FROM ORES BY DISSOLVING IN MOLTEN BATHS.—No. 766,654; R. Bag-galey, Pittsburg, Pa., and C. M. Allen, Lolo, Mont.

Method of producing matte or copper, which consists in forming molten bath of matte, blowing air thereinto, adding ore relatively high in silica, fluxing thereby iron of bath, and replenishing bath with material relatively low in silica and high in matte-making compounds.

METHOD OF SAMPLING COPPER.—No. 766,579; R. Baggaley, Pittsburg, Pa.

Method of sampling copper plates or slabs, by casting on surface of such plate or slab marks indicating location of sampling holes, and obtaining samples from various slabs at differently located portions of plate.

EXCAVATOR.—No. 766,888; J. H. Miller, Kansas City, Mo.

Excavator comprising frame, crane mounted at one end thereof, shovel carried by crane, and one or

more traveling conveyers leading from shovel to rear of frame for receiving and conducting material from shovel to rear end of machine.

ORE CONCENTRATOR.—No. 766,718; H. E. Marsh, New York, N. Y.

Combination with drum having magnetic disk at one end thereof and feeding mechanism upon drum; of suction fan at opposite end of drum, and series of baffle plates interposed below hopper and between disk and fan.

HOISTING MECHANISM FOR SUCKER RODS.—No. 767,135; W. M. Brown, Gibsonburg, O.

In device of class described, vehicle, cable-supporting member pivotally secured thereto in such manner as to cause base of member when in vertical position to be suspended from pivotal point, drum rotatably mounted at base of member and movable therewith, cables supported by member and connected to and adapted to be moved in opposite directions when drum is rotated.

APPARATUS FOR FEEDING ORE, COAL, ETC.—No. 766,539; W. R. Smith, Buffalo, N. Y.

Apparatus comprising hold or receptacle having outlet chute, belt conveyer arranged to receive material from chute, and rotary gate located in chute and extending across same, gate having curved wings forming pockets which are arranged to deliver charges of material in close proximity to each other upon conveyer, edges of wings being rigid to force their way through resisting material.

AMALGAMATOR.—No. 767,365; W. E. Vandenburg, Chicago, Ill.

Amalgamator comprising fixed conduit for pulp, mercury trough in conduit, spherical bodies revolvable

in mercury in trough, and rings spaced from and extending around spheres, also revoluble in trough and disposed with relation to spheres and in planes parallel with current of pulp.

TUMBLER FOR GOLD DREDGING MACHINES.—No. 767,009; O. B. Perry, San Francisco, Cal.

Tumbler for dredging machines and the like, having its bearing faces shaped to conform to bearings of buckets, and provided with flaring openings through which boulders and other obstructing matter are forced to clear tumblers.

CONTINUOUS HEATING FURNACE.—No. 767,243; J. Reuleaux, Wilksburg, Pa.

Continuous heating furnace provided with receiving and discharge openings, bearings for line of slabs or billets extending from receiving opening to discharge opening, and having inclined portions, fuel port opening into such furnace at point beneath and intersecting inclined portions, cinder pocket in line with entrance of such port into furnace, and means opening into port intermediate upper end thereof and cinder pocket for supplying fuel to port.

DRY SAND AMALGAMATOR.—No. 767,276; F. J. Hoyt, Redlands, Cal.

Combination with amalgamated mercury floated rotary sphere, of pipe, and nozzle thereto, to discharge on sphere, air reservoir, air compressor and an air engine, connected to operate.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

The Alaska-Perseverance mines, near Juneau, are reported sold to a company of London and Paris men. W. J. Sutherland of San Francisco, Cal., is manager.

Nome reports say development of that region has been arrested by a decision of the U. S. District Court in Nome and all ditch work is practically at a standstill pending the hearing of the case on appeal. The decision was rendered in the suit of the Miocene Ditch Co., which attempted to condemn a right of way across No. 6 on Dexter creek. The court held that the plaintiff, being a corporation existing under the laws of California, is a foreign corporation, and that "nowhere in the Alaska code can we find any provision which delegates to a foreign corporation the sovereign right of eminent domain." Nearly all the ditch companies operating on the Seward peninsula come under this interpretation of "foreign," since it is only recently that it was possible to incorporate in Alaska. The immediate result of the decision, it is said, has been to send stampedeers to stake up everything within the survey lines of ditches in course of construction. Some of the ditch companies have rushed their own men into the field to stake ahead of the stampedeers. Many of the richest claims in the section are worked out and the future of the Seward peninsula depends on ditches and hydraulicking. The report states: "On every hand short-sighted claim owners, who a week ago were glad to get a ditch through their land, are now asking thousands of dollars for the right of way through undeveloped wildcats."

## ARIZONA.

### Graham County.

Work is progressing on the new concentrator of the Detroit C. M. Co. at Morenci. The foundations for the concentrator are being laid and the material for the bins is arriving. In the old concentrator several jigs are working at full capacity, in competition for the order for the ore treating machinery with which the new building will be equipped, says Superintendent Mills. The piers for the coke and coal bins near the smelter are finished, and the iron work is on the ground ready to be placed in position.

The Monte Cristo mine is reported sold to the Arizona C. M. Co. of Clifton. Shipments of ore have been made which average 20% copper.

The Federal M. Co. has started up its smelter 1½ mile north of Safford. The ores run through are from the San Juan mine of the company, and consist of high-grade oxides and sulphides. The matte produced assays 60% copper, \$7 gold and \$5 in silver. The smelting plant is in the building erected by the Arizona C. S. Co., and consists of a 20-ton water-jacket furnace, blower, 50 H. P. Corliss engine, 40 H. P. boiler and a hot-air blast. A reservoir on the mesa overlooking the building is supplied with water pumped from a well. The building is lighted at night by two gasoline arc lamps. The Federal M. Co., operating the property, consisting of twenty-four mining claims, has done considerable development work, principally on the San Juan claim. Contract has been let to crosscut from the new shaft to the old San Juan shaft to tap the sulphide ore and work same from new shaft. The ledge will be cut at 80 feet. This sulphide ore carries copper up to 10%, and also gold and silver values. Two shifts of men are kept at work at the smelter, and at the mines fifteen men are employed.

### Gila County.

The old smelting plant of the Old Dominion C. M. & S. Co. at Globe closed down on August 15th and the furnaces in new smelter will be blown in by Sept. 15th. There will be no reduction in the number of men meanwhile, as more men will be put on to hurry to completion the work about the new smelter.

F. A. Wright of Chicago, Ill., vice-president of the Arizona-Colorado Copper Belt & Gold M. & M. Co., says he is arranging to resume development work on the company's property, 3 miles north of Globe. The company has had nineteen claims surveyed and amended notices of location filed. Two new locations have also been recorded. The principal opening is a double-compartment shaft 170 feet deep, timbered and equipped with a steam hoist and other machinery, buildings, etc. The shaft cut a streak of lead-silver ore which is 2 feet wide in the bottom, and in addition to the lead and silver values carries copper. When work is resumed by the company this shaft will

be sunk several hundred feet deeper and open the copper lead which crops north of the shaft.

### Maricopa County.

The Goddard M. Co., operating 2 miles from Wickenburg, reports progress. The main shaft is down 185 feet. A body of ore has been opened up, and the vein crosscut for 36 feet. This ore runs 15% copper and about \$10 in gold. Enough ore has been taken out to pay for development and it will be shipped to the smelter.

H. D. Bradford, manager of the Major G. M. Co., 9 miles east of Wickenburg, and owned principally by Indianapolis, Ind., men, says considerable development work has been done on the property, which consists of twelve claims, including two shafts 150 feet deep, besides several from 30 to 60 feet deep. A 5-stamp test mill has been put up, and when sufficient ore has been opened up, a larger mill will be built and water piped from the river.

### Pinal County.

The concentrating plant for the Troy-Manhattan C. Co. is on the ground at Troy and will be set up at the Davis shaft to treat the wulfenite ore opened up.

### Santa Cruz County.

The mill of the Hermosa M. & M. Co., near Nogales, has been completed and operations started. The mine is a silver producer.

### Yavapai County.

Prescott reports say the Climax G. M. Co. has entered the black dike which was struck in its tunnel and is again in ore. The vein is 3 feet wide and free milling, giving values of \$47 per ton gold. The tunnel is in 230 feet.

## CALIFORNIA.

### Amador County.

At the South Eureka mine, at Sutter Creek, grading for the mill is in progress and much of the material is on the ground. A new cable, weighing 5600 pounds, has been put in. It is 2800 feet long and has a lifting strength of forty-nine tons.

W. E. Stewart has men at work on the Butte Basin gravel claim at Butte City, near Jackson. He has sunk a shaft 100 feet deep and drifted west. The auriferous gravel is tapped 40 feet below where it has heretofore been worked. The gold-bearing gravel is being accumulated on the surface, preparatory to washing in the winter season, when water is plentiful. Water is troublesome, necessitating a steam pump. When winter rains set in it will be impossible to work underground on account of water. So the pay gravel is hoisted in the dry season, allowed to slack by contact with air and washed in winter. The gravel bed is 5 feet thick.

The work of adding forty additional stamps to the Kennedy mill at Jackson is progressing.

The Glenn mine, at Volcano, has been idle for the past two months, owing to the water supply being used for other purposes; but arrangements are being made for improvements to the mill and the taking out of ore will be begun on a larger scale. As soon as the present top tunnel reaches the Fogus mine, the ore shoot will be tapped at another and more advantageous point.—At the Madrone mine the 9-stamp mill is nearing completion. Lessley & Co. are owners.

### Butte County.

It is reported J. M. Beck of Pasadena has bought the Beik mine near Forest-town. Beck et al. are interested in the mine on the Humphrey ranch and are also the parties who have bought the Clipper Mills property.

### Mariposa County.

(Special Correspondence).—Reopening the Princeton mine is progressing favorably. Only twenty-four days have passed since the fire, yet all the top wreck has been cleared away, the machinery which is good put back, the shaft reopened 55 feet and the tunnel cleaned out, retimbered and connection made with the shaft for ventilation. Four shifts are sinking, working six-hour shafts; about a set (5 feet) each twenty-four hours is made. The gas from the burning timbers (monoxide of carbon) is particularly bad, compelling the men to take turns about working. The whole shaft may have to be retimbered clear down—a depth of 1600 feet. The surface immediately surrounding the shaft has sunk 15 or 20 feet, and until that is hoisted out the amount of work necessary cannot be estimated; but from the continual flow of gas through the caved ground it is supposed that the timbers below are still smoldering. If so, the shaft undoubtedly will cave to the depth of burning, as both foot and hanging wall are heavy swelling ground. Great credit is certainly due the management for the amount of progress made in such a short time under such difficulties.

Mount Bullion, Aug. 13.

### Nevada County.

The Central mill of the North Star M. Co., near Grass Valley, is dropping

twenty of the forty stamps. The foundations are of concrete and rock, the building, walls and roof being of corrugated galvanized iron, and as near fireproof as a building of its kind can be made, the timber utilized being merely to skeletonize the interior of the structure. The equipment consists of forty stamps with amalgamation plates and a concentrating battery of ten Dodd buddles. The mill, when all the stamps are dropping, is expected to handle 120 tons of ore daily. It is run entirely by electricity, except the rock breakers, which are driven by hydraulic power. There is a battery of three electric transformers on the ground floor. The quartz is conveyed from the collar of the Central shaft in V-shaped ore cars on tracks leading to the attic entry of the mill. It is dumped into the ore bins over grizzlies. The mortars are set on concrete foundations. The concentrates from the buddles drop into bins, while the tailings pass out of the building, running through to the cyanide plant down the hill, which is being built with cement tanks. A. D. Foote is manager.

### Placer County.

(Special Correspondence).—J. E. Belden and W. J. Esteb are opening up the Side-winder mine near Bald mountain, east of Westville. The ledge of quartz is 10 to 14 inches wide, carrying free gold, and crops on the surface for 40 feet.

Westville, August 17.

### Riverside County.

E. A. Fano, of San Diego, part owner of the kunzite mines in the Cahulla range of mountains, northeast of Pala, says Tiffany & Co., of New York, who have contracted for the entire output, have sold several large stones for as much as \$5000 each. Fano et al. have fourteen claims, 25 miles from San Jacinto, in the Cahulla range. They are down 200 feet and have done considerable drifting on the ledge. The gems are usually found in pockets. Sometimes they are in the rock and sometimes in the coarse gravel. All of the dirt is hoisted as in ordinary mining and put through different meshed screens. It is then closely examined for the stones. In addition to the gem mines they are opening up the mineral claim, the Effie. It is near the gem mines and is a gold proposition of free milling quartz. Development work on it will be increased. The surface ore assays \$20.

### San Bernardino County.

(Special Correspondence).—The Triplex copper mine has resumed operation under Manager Vance of Los Angeles. The mine, which is 1 mile west of Manvel, has been idle two months.

Manvel, Aug. 15.

### Shasta County.

(Special Correspondence).—The Mountain Lion mine is a group of eight claims in Shasta mining district, which extends to near Whiskeytown. The general formation of the district is light colored porphyry and granite, with slate. The Mountain Lion is owned by R. G. and A. L. Parmley. Tunneling has been done to extent of 800 feet and they are connected by winzes and raises. The 5 stamp mill has been run by water until lately. Power is now had from the Mount Shasta electric plant, 1 mile away. Average mill run tests of the ore gave return of \$20 per ton in gold.

The Gladstone mine, near French Gulch, after seven months of labor trouble, is again working. The main tunnel is in 3100 feet. Air connections, not direct, are made 700 feet to the surface. The air shaft at breast of tunnel is down 150 feet. At that point in the tunnel a chamber is being cut and a three-compartment shaft will be sunk and cages used. The main shoot from which ore was mined during development of last year is 600 feet in length and is thought to hold good 400 feet above. At 150 feet below the ore body is the same in character and value. The mill has twenty stamps, Frue vanners and Wilfley concentrating tables. The power used in mill and lighting the mine is transmitted from power plant 4½ miles.

French Gulch, August 16.

Redding reports say that in a mine that has been abandoned for twenty years, near Whiskeytown, A. Egerton and W. P. Flinner last week struck a pocket and in one shift took out \$430 in gold, including a \$60 nugget. L. Riehl took out \$600 from a pocket he found on the same claim a month ago.

It is reported the Mad Ox mine near Whiskeytown, near Shasta, owned by L. Reel and S. Schilling, will be sold to J. Bamber, who has had a bond on the mine with R. K. Gilson of Minneapolis, Minn.

### Sierra County.

At the Golden Scepter mine near Bunker Hill, near Downieville, pay gravel was struck last week. This mine was formerly the New Orleans, but is now owned by the Golden Scepter Quartz & Gravel M.

Co. P. H. Mason is superintendent and has eight men at work. He has been cleaning out and repairing the bedrock tunnel. A raise of 50 feet was made and then drifted 35 feet, when the gravel was struck. The bedrock was pitching at an angle of 45°; the company will run a tunnel to the east and expects to find the bottom of the channel in about 50 feet, says Mason. Lumber is on the ground for a new reservoir to be built and the company expects to be washing gravel Sept. 1.

### Siskiyou County.

(Special Correspondence).—The property of the Yellow Rose G. M. Co. consists of 860 acres on the divide between Siskiyou and Trinity counties and adjoins the Dorleska mine on the Trinity side. G. L. Carr of Carrville is president and manager and J. C. Boddeker is superintendent. Development consists of 600 feet in a diagonal crosscut, tapping the 15-foot ledge, then following it for the other 500 feet, which will be continued till under the top of the mountain. There are two other tunnels—one in 650 feet and the other 550 feet. These are connected with a winze at 85 feet in on No. 1 tunnel. The general formation and ore are similar to those of the Dorleska—serpentine with free-milling porphyritic ore—although sulphurets are coming in as depth is gained. The milling plant consists of a ten-ton Huntington mill, with amalgam plates and a Springer concentrating table. The milling ore has a value of \$15 to \$20 per ton in gold. The management intends working all winter and will put in a thirty-ton cyanide plant next spring. The mountain side above Salmon river is precipitous, so that the company has found by survey that it can drive a 4500-foot tunnel and tap the main ledge 2000 feet below the surface croppings.

Along the divide between Trinity and Siskiyou counties, near the headwaters of South Salmon and Swift creek (a tributary of the Trinity river), and about 2 miles south of the Dorleska mine, Trinity county, and the Yellow Rose, Siskiyou county, are several groups of promising claims. The country rock is largely serpentine with diorite, schist and porphyry, cutting the same in dykes. The gold is found in talcose schist and easily milled. At depth, sulphurets are found. These groups aggregate twenty claims and are owned severally by J. A. Gulick & Sons, I. N., J. H. and K. Miller, B. West and J. C. Phelps. Each of them has several prospecting shafts and tunnels and has performed assessment work for five to seven years, but is unable, without aid, to develop to 150 or 200 feet below surface. Depth to 300 and 400 feet below surface can readily be gained by tunneling.

At Le Roi group of seven claims, owned by T. Clarey, G. W. Payne and A. J. Keenan, said to be the extension of the Dorleska and Yellow Rose mines, prospecting has exposed several ledges and development now is by driving a tunnel to tap the largest ledge at depth. Assays give values of surface ores at \$9 in gold.

Carrville, Trinity Co., Aug. 16.

(Special Correspondence).—The twelve lode claims and Little South Fork placer mine of the Caribou G. M. & P. Co. are on Caribou mountain, near headwaters of the main fork of Salmon river. The ledges are in mica schist near the granite. The schist is cut by dikes of diorite, porphyry, diabase and lime, and along the dikes three quartzose veins are found. There are two systems of veins, one trending north and south and the other east and west. All carry ore, some being high grade, although the general average without sorting may at present development be placed at \$8 per ton in gold. The three ledges have high-grade shoots. N. W. Keith is manager and he has men at work developing. The main tunnel is in 125 feet, and at 1000 feet it is expected to cut the main ledge at 500 feet below the surface. The water rights owned by the company, when put to full use, will develop 5000 electric H. P. The power covered by the water rights is derived from the falls of the Three Lakes on the west and from the falls of the Salmon river on the north, both of which are within 1 mile of the central group of claims. The Caribou G. M. & P. Co. is composed principally of Le Roy, Ill., men.

Forks of Salmon, Aug. 16.

### Trinity County.

(Special Correspondence).—Clarey, Payne & Keenan control 700 acres of land along both banks of Trinity river near Trinity Center. They are for the third season operating a dredger on that ground, the bedrock being about 18 feet below the flow of water. The dredger is said to be too small in capacity in proportion to showings made at clean-ups. The richness of the gravel at the point where work is going on is attributed to the fact that the waters of Haskin creek flow into the river a short distance above. While operations can be carried on during the

winter, the season usually begins in May and ends in December.

The Big placer in operation above Trinity Center, T. McDonald manager, is now engaged in regular clean up and until December repairing and preparing for the next season's work will be carried on. As is the case with most of the gravel mines of Trinity county, the run this year has been satisfactory.

On the north side of Battle creek, and on same contact as the Three Peaks mines, is located the Deacon Gulch mine, composed of four claims, owned by and being worked by G. Cook and W. R. Conant. Development so far is by crosscut tunnel 300 feet in, cutting 6-foot ledge at 110 feet below surface. The 100-foot shaft is in ore, a white quartz showing an average assay value of \$10 per ton in gold. Development will continue until winter months.—In same mineral belt as the Deacon Gulch mine and at head of Hard-scabble gulch is the Tom Keating property, sold to Redding parties. Development consists of 600 feet of tunneling and ore is being treated at a 1-stamp Kendal mill.

The Trinity G. P. M. Syndicate, Ltd., main office London, Eng., owns on Coffee creek, 14 miles from Carrville, 800 acres, and also 4 miles along Union creek, which connects them with Coffee creek. W. Maitland is manager. To make dumping ground a 900-foot tunnel was driven. Work this year has been development, running ditches and cuts in order to go farther up Coffee to a new and larger bar. The 1200 feet of sluice boxes will be so arranged as to break ground on the two sides. The company owns a sawmill and has thirty men on payroll.

Systematic development on the Strode mine, near Carrville, is showing satisfactory values. The apex of the mountain, where outcroppings were first discovered, is 1630 feet above the mill, and the width of the ledge at that point is nearly 6 feet. The ore of the mine is free-milling, with values in gold, 85% being saved with batteries and plates, and the tailings saved for future cyaniding. Development is by a series of tunnels following in on the ledge, which is white sugary quartz in slate and serpentine. There are several tunnels, the 750-foot one being in 1300 feet and the 1000-foot, or lower one, in 1200 feet. The several tunnels are connected by raises or winzes and all ore is brought out and trammed to bins from the lowest one. In the lower tunnel, at 1000 feet in, is a chamber 32 feet in length by 12 feet high and 12 feet wide, where a 100-foot shaft has been sunk. The bottom of the shaft is 1100 feet below top of mountain and the ledge shows 30 feet in width. The 5-stamp mill is arranged for placing five additional stamps and run by water power. The mine is also known as the Oro Grande and \$40 ore is milled. High-grade tailings are saved for cyaniding.

The Three Peaks mine, on Iron mountain, near headwaters of Battle creek, a tributary of Coffee creek, has been bonded by G. Cook, H. Weiser and W. R. Conant to T. S. Henderson & Co. of St. Louis, Mo. In the groups are five claims and a millsite; on the latter a 10-stamp mill has been built, with arrangements for five more stamps. Development shows the main ledge 3 to 8 feet in width, a contact between porphyry and serpentine, with gold values. Diorite dikes cut through this formation with vein matter in connection carrying silver values. The vein matter of the contact ledges is a white, sugary quartz at times showing free gold. The water right in connection with the property has to the mill a fall of 700 feet of 500 inches of water, coming from springs 3 miles away. The same water to level of Battle creek has a fall of over 200 feet. W. R. Conant is in charge as manager, and development is to be increased by sinking shaft from top of ledge at outcrop.

Trinity Center, Aug. 16.

(Special Correspondence).—The Sherwood mine, on Battle creek, 2 miles north of the Mountain Boomer mines, is in the New River district, and was located in 1883. Over 1000 feet of tunnel have been run, nearly all of which is on the ledge. The mine is equipped with a 2-stamp mill run with water power. A recent crushing of 187 tons ore realized \$20 per ton, free milling, and about 2 tons of concentrates saved with a Frue vanner. It is the first time that sulphurets have been saved with a concentrator in the district.

The Trinity County Development Association, organized in February, 1904, by residents and persons interested in Trinity county, is working to call attention to opportunities for profitable investment in Trinity county. The furnishing of reliable information concerning every section and industry of the county and inviting examination and development of its resources, are its objects. Permanent headquarters are established at Weaverville, and an ex-

hibit of minerals and products of the county is there maintained. A splendid map of the county has been prepared and a prospectus concerning the county will be issued and distributed. The Association is asserting itself against the maintenance of forest reserves in that section, and is endeavoring to arouse public sentiment towards an effort to get wagon roads and railroads from the Sacramento valley to Eureka.

Weaverville, Aug. 17.

(Special Correspondence).—Four miles below Denny on East Fork is the Sherwood mine, owned by J. W. Bartlett of Weaverville. The ledges, 3 to 15 feet in width, are in serpentine and porphyry and the ore is free milling and concentrating quartz with values \$20 per ton in gold. The 1000-foot tunnel gives a backing at the breast of 250 feet to the surface.

The Enterprise mine is a group of fourteen claims, 1 mile from Coleridge on the East Fork of the North Fork of the Trinity river. The general formation is granite and slate, with the latter for hanging wall. The ledges lie at an angle of about 30°. The main tunnel follows ledge 1200 feet and to a depth of 500 feet below the surface. The lower tunnel at the mill, 300 feet below the 1200-foot tunnel, is connected by stopes and raises. It is estimated that between the long tunnel and winze in upper tunnel 50,000 tons of ore are ready to be stope out. On the Lone Jack claim of the group \$50,000 was taken out by former owners above the 100-foot level. The ore is free milling gold, with small percentage of sulphurets, average value \$20 per ton. This property is bonded to M. Manley for Boston, Mass., men. Manley will place forty men at work and do development through the winter. On the property is a 10-stamp mill, a Frue Vanner and a Woodbury concentrating table. All machinery is run by water power.

The Yellowstone is a group of sixteen claims near Coleridge. Six of the claims are held by U. S. patent. The property has been bonded by M. Manley for Boston, Mass., men, who propose working it during the coming winter months. Granite and slate formation with ledges of 2 and 3 feet in width are shown, with over 5000 feet of development. Ore milled from a 1-foot ledge gave average value of \$50 per ton in gold. A 200-foot shoot of a 3-foot ledge gave average value of \$8 in gold. There is a 10-stamp mill. In October men will be put at work. G. R. Woodin is at the head of the Boston companies bonding the Yellowstone and the Enterprise mines.

The gravel and placer mines of Trinity county have been doing well this season and all cleanups have been satisfactory to owners. The Hupp mine of 512 acres patented ground, 4 miles from Weaverville, has been worked for forty-six years, and no season to better profit than this one. Two and a half acres of ground were worked. The banks are about 30 feet thick.

Weaverville, Aug. 17.

(Special Correspondence).—The Dorska mine of the Union Con. G. M. Co. is on the divide separating Siskiyou and Trinity counties, near headwaters of Union creek, a tributary of Coffee creek. This property, at an altitude of 6500 feet, comprises 1200 acres of U. S. and railroad patented land. The main ledge is 8 feet in width between serpentine walls, with a body of talcose schist next to each, carrying free gold. The ore is porphyritic in character and free milling with a small percentage of sulphurets. The main shaft is down 300 feet and a drift from the 300-foot level cut a 120-foot shoot of ore 10 to 22 feet in width. At the 300-foot level drifting extends north 1300 feet from shaft. From 200-foot level drifting amounts to 92 feet. All stoping has been done between 200-foot and 300-foot levels. The 2000-foot tunnel—the greater portion being of snowsheds—taps the main shaft at the 300-foot level. In sinking the shaft, the walls were cut through at 320 feet, the last 150 feet of the shaft being in solid serpentine. The crosscut 45 feet to the 120-foot ore shoot was then made. The mill consists of a Huntington, ten stamps and two Frue vanners and crushes thirty tons of ore daily. It is estimated there are over 6000 tons of tailings in the pond awaiting construction of cyanide plant. H. Z. Osborne, of Los Angeles, is president and manager and M. H. MacIlwaine is superintendent at the mine.

Rogers & Denton have leased and bonded the Keno mine, which includes 160 acres of patented ground near Doblen station on the Trinity Center and French Gulch stage road, 20 miles west from French Gulch, Shasta county. The workings are entered by a 400-foot tunnel. The ledge is 1 foot in width, being on the contact between porphyry and slate; character of the ore a decomposed white quartz, free milling, with value of \$7 in gold per ton. The mill is two stamps and

run by steam. Rogers & Denton are driving a new tunnel to strike the ledge at 140 feet in depth.

The Van Ness Bros. are working in connection with S. J. Robinson a group of four claims 2 miles west of Doblen station. The vein matter is 20 inches in width in a greenstone and porphyry formation. At 150 feet in on the ledge and 200 feet below the surface, the ore shows free gold and assays \$30.

The North Mountain Power Co. is digging a ditch, tapping the water of Canyon creek, 2½ miles above Junction City. The ditch, when completed to the power plant on Trinity river, will be 9 miles in length. The purpose is to transmit light and power over Redwood and South Fork mountains to Eureka. The plant is expected to be completed January 1, 1905. It will be of 2250 H. P. and there will be two transformer stations on the route. The water rights were bought with the gravel mines opposite Junction City from the Cie Francaise de Placers Hydraulique.

The Fairview mine, near Minersville, has 125 men at work. The millmen and carpenters are putting in twenty additional stamps and plates. A dynamo will be placed for lighting the works and running the air compressors for drills used in No. 4 tunnel near the mill. When the water power plant is completed, there will be two 6-foot Pelton wheels in use, driven by an 80-foot head. Water will be brought from Stewart's Forks, a branch of Trinity river, 2½ miles away.

The May Queen property, a group of nine claims, on North Fork of Coffee creek, 2 miles from the Nash gravel mine, and owned by R. G. Abrams, M. H. MacIlwaine and G. W. Payne. A ledge of 3 feet in width in schist, serpentine and porphyry shows ore at surface, free milling with \$8 per ton in gold. Development is by a 125-foot tunnel following ledge.—The Boomer mine, near Denny, is owned by the Bobs Farm M. Co., and employs twenty men, who are developing the property under management of W. Montgomery. The formation is serpentine and porphyry and the ore free milling. The lower tunnel follows a 2-foot ledge 450 feet and is 900 feet below upper discovery. Ore is treated on the property in a plant containing a Huntington mill, five stamps and plates. All machinery is run by water power.

Trinity Center, Aug. 17.

#### Tuolumne County.

(Special Correspondence).—The John Royal gold mine on Experimental gulch, 1 mile north of Columbia, has been sold and a 10-stamp mill is being built. There are over 3000 tons of high-grade ore on the dumps. The ledge is large and in early days rich ore was extracted, but little work has been done since then. The Pine Log placer is at one end of the gulch and the Tres Pinos at the other end. W. G. Phipps is superintendent.

Columbia, Aug. 17.

The Buzzard Hill mine, near Tuttle-town, which has been idle for six years, has been relocated by D. Oneta et al. A shaft is being sunk on the vein which is 9 feet wide and carries free gold and sulphurets. Development work will be increased.

The Blue Bell G. M. & M. Co. has bought the Blue Bell No. 2 quartz mine, on east slope of Provost mountain, 4 miles east of Carters. W. J. Symons has deeded to same company Blue Bell No. 3, first northerly extension of No. 2.

At the Jumper mine, at Stent, the 40-stamp mill is steadily in operation. Nothing but development work is being done. Manager Kerr is preparing to sink and is pumping the water from the 1200 level.—Manager McGovern of the Republican mine, at Jacksonville, reports main shaft is sunk 60 feet below 600-foot level. The 20-stamp mill is in continuous operation.

#### Yuba County.

L. Pieratt has bonded the Gottwals 130 acres of bottom lands along Feather river below the Gridley bridge, 9 miles above Marysville, for \$7800. The land is to be prospected for gold with a view to placing dredgers upon it, and the drills are to begin work within two months. C. Gottwals reserves all his uplands, but will prospect them for gold, and if they prove to contain sufficient values, the whole farm will go for dredger land.

C. H. Hill, interested in the Blue Gravel, Deer Creek and Mooney Flat mines, says the complications surrounding the New Blue Point mine, owing to litigation by creditors, have been settled and the company is arranging to start work in part of the mine. The company owns and controls 690 acres of placer mining claims on what is known as Blue Gravel channel, near Smartsville, including an area for the deposit of debris in restraining dams. The principal place of business is Los Angeles, with a branch office in San Francisco. C. H. Hill is president, with A. G. Nason, J. H. Mullin, E. L. Hutchinson, W. M. Berry, C. Hyde and E. Tinsnerat

officers and directors. The deposits extend from near Smartsville to Mooney Flat, 1 mile. Hydraulic mining can only be conducted after a permit has been granted by the U. S. Debris Commission, and heretofore land for restraining dams could not be obtained by the companies. It has secured a large tract owned by the Excelsior Co., and there is every facility to care for the debris washed from the mines, and the manager says that when a dam is finished mining will begin.

#### COLORADO.

Colorado's gold statistics for the first six months of the current year are reported showing a total tonnage of 332,300, with a valuation of \$10,522,800.

#### Clear Creek County.

Operations have been resumed on the Tiger group of claims, up Grizzly gulch, near Georgetown. Wheeler & McCreedy, owners, will continue work on the tunnel. It is expected the Tiger vein will be out at a depth of 200 feet below the old workings. At present the tunnel is being driven on a crosscut lode which is showing mineral.

The United Light & Power Co. has completed a contract for equipping the Lamartine, near Georgetown, throughout with electric power. Since the contract was awarded by the Lamartine M. Co., the entire plant of machinery has been connected. The compressor is operated by an electric line furnishing 20 H. P., as is also the hoist. It was necessary to string the electric line 1000 additional feet in order to supply the mill with power.

Work is being resumed on the Saxon Extension group, on Saxon mountain. Operations will be centered on driving the upper tunnel, which is in 800 feet. The upper tunnel was started one year ago and during the work considerable ore was taken out. The mill dirt is oxidized. The principal values are in gold, while a small percentage of lead is also found.

The East Griffith mine, near Georgetown, owned by W. H. Hoover, is being equipped with electric power. A hoist has been set up at the 1200-foot station of the tunnel level, where sinking has been in progress. A streak of ore is being followed. The electric line has been extended to the tunnel entrance and the cable connections are being made. Manager Hoon of the United Light & Power Co. says 20 H. P. will be furnished for the operation of the hoist. Extensive development work has been planned. A. Ericson and C. Gileon, who are operating a block of ground at the 2000-foot station of the tunnel level, are making headway. It is expected additional leases will be issued. R. McClosky has been appointed resident superintendent.

#### La Plata County.

Construction of the hydro-electric plant of the Animas Co., R., W., P. & I. Co. at Rockwood station, midway between Durango and Silverton, is under way. Contracts have been awarded for the electric and hydraulic apparatus for building the flume line and dam and for preparing the reservoir site. It is expected everything will be completed and in working order by May 1, 1905. The completion of this plant will give to the San Juan district the same advantages of cheap power that Cripple Creek and other sections of Colorado have.—The initial plant of the Animas Co. will have a capacity of 6000 H. P. F. O. Blackwell of New York City is consulting engineer. H. T. Henderson of Durango is president and chief hydraulic engineer and has charge of all construction work. The other officers and directors of the company are of Indianapolis, Ind.—B. F. Schmid, manager; T. N. Hardin, J. R. Love, P. Grey, J. W. Adams, W. E. Bundy, F. O. Froeb and C. F. Woerner. Cascade creek, a stream that flows into the Animas river above Rockwood, will furnish power for first installation. At a point 6 miles above its mouth a diverting dam has been constructed and so arranged that the water is turned from its natural course into a box flume 6 feet deep and 8 feet wide, in which it is carried for 3½ miles. Then it is conveyed to the reservoir in a natural water course 2½ miles long. Practically all of the waters of Cascade creek will in this way be diverted from their natural course, giving a head of 1000 feet above the water wheels in the power house below. Grading for flume is completed and the stringers and mud sills laid. There is said to be a difference of 1450 feet in elevation between the points where the water is taken from Cascade creek and where it enters the Animas river. Four hundred and fifty feet of this is taken up by the flume, ditch and reservoir. Cascade reservoir is a natural basin 3½ miles long and 1 mile wide at its widest point. A temporary crib dam 55 feet high is being built. This storage is calculated as sufficient to operate the first plant of 6000 H. P. for a period of three months without any additional water supply. This

temporary dam is being constructed for two purposes. First, so that the company can deliver power sooner than if the dam were constructed of stone. Second, it will enable the company to use its own power in the construction of the second dam. The main dam will be 100 feet high and will store about 5,000,000 cubic feet of water. Power station No. 1, which is 2 miles above Rockwood, is designed for a capacity of 12,000 H. P. It is on west bank of Animas river. Below the penstock the water will be carried in steel pipes 44 inches in diameter at the top and 38 inches at the bottom. While all parts of the plant are designed for 12,000 H. P. capacity, only 6000 H. P. will be developed to begin with. Additional units will be put in as the demand for power increases. The first installation will consist of two General electric generators, each directly connected to a Pelton water wheel. These generators will be of the three-phase, sixty-cycle, revolving field type. These units will operate at 300 revolutions per minute. The power will be generated at 4000 volts, then passed through two banks of transformers, each bank having a capacity of 3000 H. P. and consisting of three transformers. In these transformers the voltage will be increased to 50,000 volts. Surveys have been completed for rights of way for transmission lines, which will reach all of the principal mining sections in the San Juan district. These lines will extend into San Juan, Ouray, Hinsdale, La Plata and Montezuma counties. In addition to mining purposes, the company expects to furnish current for lighting the principal towns in the district and also to the smelter of the American S. & R. Co. at Durango.

#### Ouray County.

(Special Correspondence).—The Genesee and Vanderbilt mines in Red Mountain district are being operated by the Red Mountain Railroad M. & S. Co. The mine has been equipped with a Leyner 12-drill compressor. The company is making preparations for building another compressor plant on the Joker tunnel, 4500 feet north from the Genesee tunnel. The Joker will be 3300 feet in length and will drain the Yankee Girl and Augusta mines. At present the company is doing development work in the Genesee. G. B. Croft is superintendent and G. Crawford manager.

W. J. Hammond, Jr., manager of the Treasury Tunnel M. Co., has been operating in this district the past seven years, and has driven the Treasury tunnel 5000 feet. He is breaking ground for a 20-stamp mill, which will be supplied with power for forty stamps. A switch will be put into the mill to connect with the Silverton & Red Mountain railway. They are also erecting bunk house and office buildings. The company is composed of Eastern men. The tunnel when completed will cut the Tom Boy, Smuggler and other veins. The Handicap vein is being developed, which was cut 4500 feet from the portal. The ore lead will average 5 feet in width. The ore is sulphide, carrying a percentage of copper, lead, gold and silver.

Red Mountain, Aug. 14.

(Special Correspondence).—Development work is being increased on the Barstow mine under management of J. Geisel. The new tunnel is in 1120 feet and is expected to strike the ore body within the next sixty days, when the new 40-stamp mill will be kept busy day and night. But ten of the stamps are dropping at present. The mill contains stamps, plates, sixteen tables and four slimmers.

Ironton, Aug. 14.

#### San Juan County.

(Special Correspondence).—The Cummaron M. P. & D. Co., above Animas Forks, on an extension of Engineer's mountain, is driving a tunnel on its property. They state the ore averages \$25 per ton. Calumet & Hecla people are said to be backing the project.

Animas Forks, Aug. 13.

(Special Correspondence).—The Silverton M. Co., T. R. Henaben superintendent, has its tunnel in 2800 feet and is driving to strike the Eunice-Sound and Democrat veins. There remains about 50 feet farther to drive before striking one of the veins, which will be 1150 feet below the surface. The property is on Sultan mountain. The ore is lead and gray copper. The company owns 500 acres of mineral land. Power drills are used for driving the tunnel. The mill on the property is not in use at present.

Silverton, Aug. 14.

(Special Correspondence).—A compressor plant is being put in at the Domingo group of mines. The Con. Eureka M. & T. Co. is owner of the Domingo group, and has started work driving a 7x7-foot tunnel and timbering with 10x10-inch timbers. Some development work has been done on the claims. With this tunnel they will cut the vein 2300 feet deep.

The property is on Niagara mountain, opposite the Sunnyside mill. N. Gregg, of the Gregg Investment Co. of Denver, is manager, and S. Davis is superintendent. The Eureka Exploration Co. is doing development work on its property in Maggie gulch, and assays show ore running from \$1.32 to \$10.80 in gold and 83 cents to \$7.24 in silver. The company is working the Ridgway group in Cascade basin at head of Maggie gulch. This company is also operating the Silver Wing and Fredrica mines. On the Wing there are 3000 feet of development work and also has a 100-ton mill on the property. It is equipping the mill with a steam plant.

The Astor M. Co. is driving tunnels to cut the Toltec and Mogul veins and both are reported nearing the veins. They are putting in a steam plant to supplement water power. They are able to run with water power seven months in the year. E. C. Condit is manager.

One hundred and twenty-five tons of ore daily are going through the Sunnyside mill. J. H. Terry is owner, W. L. Terry is superintendent of the mill and J. T. Terry is superintendent of the mine. They are shipping thirty-five tons of concentrates per day. The old 15-stamp mill of this company is run during the summer months and the new 40-stamp mill is operated the year around. The Sunnyside Co. has been doing extensive development work the past eighteen months and has a large amount of ore blocked out. A canvas plant is being put in below the mill, and if same proves successful will install slime tables. They are also contemplating putting in zinc separators.

Eureka, Aug. 15.

(Special Correspondence).—H. S. Born is working the Little Maude in Maggie gulch. He has six claims. His ore is said to run two ounces in gold and seventy ounces in silver per ton without sorting.

Howardsville, Aug. 13.

The Jenkins M. Co. has been incorporated by M. Smith, S. E. Hunter, T. R. McKee, B. G. Lester and C. W. Lothrop, to operate near Lime creek, and also in Maggie gulch, near Silverton. The Colorado I. W. Co. is overhauling its pipe line on the Animas river, above Eureka, and the construction of a power house is also under way. The plant is expected to furnish 600 H. P., and a direct transmission of electric current is expected to be made to Sunnyside mill and mine.

#### Teller County.

Cripple Creek reports say the flow of water from El Paso drainage tunnel is slowly receding from its original volume. It is recorded every week and the number of gallons flowing through the portal last week measured 5200 gallons per minute, or 1300 gallons less per minute than when the tunnel was opened. The benefit, however, has been achieved. The lower levels of a number of the largest mines in the district are dry, while in such mines as the Gold King, in Poverty gulch, the water has been lowered to the 900-foot level. In fact there is not a mine in the entire north end, says the Gazette, which has not received some benefit from the tunnel. While the water is receding, the tunnel is still doing work for several properties, as some of the mines whose lower levels were covered for several years are now able to sink another 100 feet, with the water still going down.

The Portland mine at Victor is mining 200 tons of ore per day. Attention has been given to the timbering of the property, so the production of ore has been lower. The company intends to erect an ore house adjoining the one built at No. 2 shaft. The grade of ore being mined is giving average returns of \$30 per ton.

It is reported that the Hull City placer and Golden Cycle companies will resume operations near Cripple Creek. The Hull City placer litigation is expected to be settled in September and the property will reopen with 50 to 100 men. The Golden Cycle property is expected to start operations either under the control of stockholders or a receiver. This will give employment to 200 men, and with the further opening up of the Independence mine another 100 men will find employment, all contributing to increase the monthly production and the camp's payroll.

Cripple Creek reports say Lessees Russell & Sharpe, operating under lease a block of the Colorado Boss No. 3, are putting in an air compressor at the surface in their new shaft. The compressor will have a capacity of fourteen drills. The lessees have opened up a shaft running from the north and south drift which gives them a direct outlet through which to hoist all their ore. The lessees have been working from the Peggy shaft.

J. A. Lippert and J. McFeeley, who are operating the Delmont claim on Beacon hill, Cripple Creek, have started sinking and intend going to the 200-foot point to cut the extension of the ore-breaking

ledge opened in the Lonaconing. A plant of machinery will be installed. Lessee Darnell, who has the lease on the south end of the El Paso, has started to sink a new working shaft. The first 50 feet has been completed and a plant of machinery will be set up over the shaft, which is near the south end line. J. O. A. Carter, who has the option on the Free Coinage on Bull hill, will sink the Pueblo shaft another 200 feet.

#### IDAHO.

##### Blaine County.

At Muldoon, J. Peterson of Hailey is putting in a water wheel, a crusher and a jig on the Blue Bird group. The jig will have a daily capacity of ten tons of ore and will test the ore in the mine, while at the same time partially paying expenses until a larger mill is deemed necessary.

##### Boise County.

Superintendent Hager of the South Africa mine, near Idaho City, expects to start a new shaft this week. It will be sunk on the bench east of the old works, and will cut the ledge on the dip at depth of 300 feet. The ledge has been opened in places both north and south of the cut and the ledge said to be exposed for a width of 200 feet carrying gold values. Hager will put up a 20-stamp mill when the shaft cuts the ledge.

##### Kootenai County.

The Jupiter G. M. Co., says Manager Winters of Spokane, Wash., has machinery on the ground for a 6-stamp mill which is to be put up at the Buckhorn mine, north of Bonner's Ferry. Development work will be increased.

##### Shoshone County.

The Golden Chest M. Co., near Murray, has resumed operations. They have taken out the old boilers and are putting in machinery from the Idaho mill. The engine from the Idaho is a Corliss of 150 H. P. This will furnish power until the rainy season sets in, when water power will replace steam. The Chest mill a year ago closed down for development work and repairs. They have done considerable development work and have blocked out ore for the twenty stamps. Water power will be used when possible during the wet season and steam power at other periods.

The silver-lead mines of the Cœur d'Alenes in the output of the first six months of 1904 exceeded that of the corresponding half year of 1903. The total tonnage of ore and concentrates shipped during the first half of 1904 is given as follows:

	Tons.
Federal Co. (four mines)	48,000
Bunker Hill & Sullivan, Wardner	27,485
Morning Star, Mullan	16,914
Hecla, Burke	6,842
Snowstorm, Mullan	7,500
Hercules, Burke	6,197
California Con.	562
Frisco leasers, Gem	350
Stewart	160
Hunter, Mullan	150
Wyoming	35
Total	114,195

The total shipments for the first six months of 1903 amounted to 99,031 tons. In the entire year of 1901 the mines produced 148,890 tons of ore and concentrates; 160,310 tons in 1902; 200,596 tons in 1903. The Cœur d'Alene mines are producing about 36% of the total lead output of the United States, to which are added 6,000,000 ounces of silver.

At the Elk City gold mine at Elk City, Superintendent Johnson says the drift from the shaft is showing 18 to 24 inches of ore carrying free gold. On the other side of the creek it shows a 3-foot ledge. Manager Swinerton of Wardner is preparing to put in a 2-stamp mill.

##### Washington County.

G. W. Dorsey of Boise says the Blue Jacket mine in Seven Devils district, near Landore, in which he is interested, is being developed. They are working in five stopes and sacking high-grade copper ore. The ore is principally bornite. The company has started the pump and will unwater the lowest level, 115 feet below the tunnel level. There has been little or no ore extracted from this level. In addition to the Blue Jacket, the company is working the Queen and Calumet mines of the same group, and is taking out ore from both. A contract has been made with the Ladd Metals Co. for the product of the mines. The smelter is expected to be blown in next month. The effect of creating that market has been to put other properties in operation. The White Monument, the Helena, the Peacock, the Alaska and several other mines in the same section are being worked and are sending ore to the smelter company's bins. Other districts in that part of the State are also active. At Black Lake and Iron Springs work is in progress and the roads are lined with freight teams carrying machinery and supplies.

#### MONTANA.

##### Deer Lodge County.

The Moose Lake M. Co. is operating the Dandy and Daisy mines at Moose Lake, 38 miles from Anaconda. Its mill is crushing twenty-five tons of ore daily. On the 300-foot level the crosscut tunnel is in 380 feet and will be driven 55 feet farther to cut the ore body. A gravity tram transports the ore from the upper levels. The vein is 25 feet wide, averaging \$8 per ton, and has a 3½-foot shoot going \$30 per ton.

##### Jefferson County.

It is expected the Golden Sunlight group of twenty-one patented claims, 4 miles from Whitehall, will be worked again. The property was formerly owned by the American Dev. & M. Co. E. Ring of Butte, with New York, N. Y., and Chicago, O. Ill., men, has organized a company to operate them. They are experimenting to ascertain the process by which the ore can be treated to best advantage. The ore is gold and silver-bearing. The American Dev. & M. Co. built a 100-ton mill at the mines and operated it for a time.

#### NEVADA.

##### Lincoln County.

R. Yansey and W. and R. Yoeman of Manvel, Cal., report making a strike on north side of Newberry mountain, near Needles, Cal. The ledge is 4 feet in width and shows value of \$26 per ton in gold, silver and lead. It is a smelting proposition, and it is expected arrangements will be made for the smelting of the ore at Needles, Cal.

##### Lyon County.

The Bluestone copper mine near Yerington has been sold to M. J. Heller of San Francisco, Cal., and a company of New York men for \$125,000, and first payment of \$10,000 made. Development work will begin by Sept. 1st. Heller says the ore will be worked by the electro-magnetic separating process.

##### Storey County.

Virginia City reports say an agreement has been made by R. F. Morrow, D. O. Mills et al. with the Alta M. Co., by which the Alta M. Co. of lower Gold Hill will give the use of its shaft, over 2200 feet in depth, to the other mines in the vicinity for drainage and general mining purposes. The electric pumping plant being put in at the Ward shaft for drainage of the middle mines, with the similar plant in the C. & C. shaft, and the one to be installed in the Alta shaft, will mean the unwatering of the entire Comstock lode. The first installation of electric pumps was made in the C. & C. shaft for draining the following mines: Best & Belcher, Con. Virginia & California, Ophir, Mexican, Union Con., Sierra Nevada and Utah Con. The pumping plant in the Ward shaft will drain the Chollar, Potosi, Savage, Hale & Norcross, Gould & Curry, Bullion, Exchequer, Alpha. The Alta shaft pumping plant, which will be the largest of the three, will drain the Belcher, Seg. Belcher, Crown Point, Yellow Jacket, Caledonia, Challenge Con., Confidence, Imperial Con., Alta, New York and Justice. The showing made by the Caledonia mine is said to be largely the cause of the plans for extended drainage of the Comstock lode. In that mine a body of medium grade ore from the 900 to the 1200 foot level is reported being developed. The water level of most of the Gold Hill mines will correspond to the 1200-foot level of the Caledonia, which mine is worked through the Overman. The pumping plant is to be installed in the Alta, and the water will be drawn through the Caledonia, which will be connected.

#### NEW MEXICO.

##### Lincoln County.

Manager Franklin of Chicago, Ill., is at Jicarilla to start building a mill for treatment of the ores of the camp. The mill will have a capacity of 100 tons a day, but at first will treat only 50 tons per day. There is said to be enough ore on the dump to keep the mill running a year. At present there are three producing mines in the district.

##### Sierra County.

The mines and other property of the Pelican M. Co. at Hermosa has been sold at sheriff's sale to H. C. Flower of Kansas City, Mo., for \$5436.40. On the same day the pipe line and other improvements of the Hillsboro G. M. & M. Co. were sold by sheriff under a mortgage for \$4500.

##### Socorro County.

The Dry Creek G. & S. M. Co. has been organized by Dayton, Ohio, people to operate near Mogollon.

##### Taos County.

One foot of ore is reported struck on the Jayhawk mine at Red River that runs \$39 per ton in gold. The balance of the lead—5 feet—averages \$10. In consequence, work has been resumed on the Jayhawk mill and teams are hauling the ore to the mill.

NEW YORK.  
Madison County.

Gold ore is reported found near Georgetown. Samples of the ore are said to give \$6 per ton.

OREGON.  
Grant County.

The Thornburg placers, near Granite, have been sold to W. L. Vinson of Baker City and Chicago, Ill., men, for \$40,000. The capacity of the ditches will be increased and a bedrock flume put in. To do this it is estimated that about 500,000 feet of lumber will be required. This can be cut on the ground, as there is abundance of timber with a sawmill ready to do the cutting. The hydraulic giants are still cutting away the gravel banks.

The May Queen 10-stamp mill, near Granite, will be put in operation this week. The management has miners stopping ore from one of the pay shoots in the mine. The ore bins at the mill are full. There is a body of milling ore blocked out in the mine.

SOUTH DAKOTA.  
Lawrence County.

Deadwood reports say the Rossiter cyanide plant in that city has been leased by local parties for treating the 40,000 tons of tailings that in the early history of the mill came from the plant. The bank of tailings averages \$4 a ton. It is said they can be run through the mill again and a saving of \$3 a ton made.—Broken Bow, Neb., men have started development of a tract of ground in Miller's gulch, 2 miles east of Garden City, having organized the Elliptic M. Co. A shaft has reached a depth of 130 feet and it will be put down to quartzite, which will be 300 feet from surface. The company has taken over the property of the Arcade M. Co., which give it a total acreage of 1100 acres.—The Penobscot Co. has resumed shipments of ore to Denver, Colo. The ore averages \$50 a ton. A heavier air compressor has been put in at the mine.—A night shift has been put on by the Hidden Treasure Co., which is developing a large property in Deadwood gulch 4 miles west of Deadwood. The company expects to build a mill this fall. S. T. Cochran, of Lincoln, Neb., is president.—Work on the Goldstake property near Maitland is being increased. Air drills will be put in and a tunnel is being driven 1800 feet. A raise is being made to the surface. Several vertical veins of free milling ore have been crosscut by the tunnel. O. N. Pryce, of Deadwood, is manager.

Garden City reports say machinery for the Dizzy M. Co. is on the ground and will be set up at the main shaft. Work was started at the Dizzy property in June. Deadwood reports say 4000 tons of ore are sent down from Bald mountain every thirty days for the Imperial cyanide plant at Deadwood. The McGovern property, carrying cyaniding ore, has also been bought by the company. W. S. Elder of Deadwood is president of the company, and J. W. Milliken has charge of the mill.—The first test run has been made by J. Conzett with his mill east of Deadwood, near Galena. With a few changes in the mill regular operations will be resumed with a capacity of 100 tons a day. The ore is free milling, and arrangements will be made to save the tailings and concentrates, which are to be cyanided.

H. H. Francis of Custer, manager of the Dizzy M. Co. and the Omaha G. M. & M. Co., is increasing work on the latter property and preparing for work on the former. A shaft is being sunk on the ground of the Omaha Co., under contract, and is down 80 feet. They are using a whim in raising the material. A steam hoist, pump and other machinery are being placed by the Dizzy Co. and it is expected that sinking will be started in the shaft this week. The Dizzy Co. did prospecting last year with a diamond drill and the shaft is following the drill holes and intends to explore quartzite. The properties of the Dizzy and Omaha Cos. are adjoining and on False Bottom creek, 2 miles north of the Penobscot mine in Garden City district, near Deadwood. There is a large acreage in each tract and both companies are well financed and prepared for work.

The management of the Globe G. M. Co. is preparing to build a mill on its property, near Lead. It has been decided to adopt the Chili mill for pulverizing the ore and afterwards to cyanide it, says Superintendent Wade.

The Alder Creek G. M. Co. is preparing to resume operations at its mines on Yellow creek, near Kirk, south of Lead. S. F. Balliet of Des Moines, Ia., is president. It is proposed to increase the capacity of the mill and cyanide plant. The company's property adjoins that of the Wasp No. 2.

The Clover Leaf M. Co. is putting in a 350 H. P. engine at its mine at Roubaix. The company is also putting a hoist in on

the 700-foot level for continuing the shaft to 1000 feet. That will avoid interference with operation of cage in main shaft. All sixty stamps in the company's mill are dropping. New cages having double decks have been put in the shaft.

W. E. Hahn, of Deadwood, secretary and manager of the Anaconda M. Co., says arrangements are being made to reopen the company's property next month. The Anaconda ground covers 600 acres along Elk creek and extending northerly to Bear Butte creek. The principal development work on the ground consists of a shaft, 200 feet in depth, equipped with steam hoist, pump, and air compressor. The ground is crossed by a series of parallel vertical quartz ledges containing free gold and sulphides. The main shaft has been put down on one of these. It is intended to continue the shaft to 500 feet. The company owns a water right on Elk creek that controls sufficient water to supply a mill. The location is advantageous.

The Tinton Tin Co. at Tinton is running its mill and saving the concentrates for shipment. The company has 80,000 pounds of tin concentrates ready to be sent to Wales for reduction. Development work continues in the mine and additional tin ore bodies are being opened. The ore is crushed, then passed through rolls and afterward concentrated. M. H. Lyon is manager and E. St. John superintendent.

UTAH.

Summit County.

The Marsac mill at Park City, one of the landmarks of the camp, is being torn down, says the Miner. The contract let last week is for wood work alone. The masonry is under the boilers, and the two engines together with the smokestack will be handled by the company.

Tooele County.

The output of gold from the Con. Mercur mines at Mercur during the month of July is reported at \$60,000, or an increase of about \$10,000 over the June production.

WASHINGTON.

Lincoln County.

Machinery for the Turk M. Co. smelter is at Davenport and teams are hauling it to the site in Cedar canyon. It will be blown in about October 1st. The ores of Cedar canyon have thus far been hauled by wagon to Davenport and Springdale, over 30 miles distant, and then shipped by rail for treatment. Ore in that camp must assay \$40 before a profit can be made under present conditions. Consequently much of the dumps can be smelted. Low-grade properties tributary to the plant will resume work and the prospectors will open new ground. The smelter will start with a capacity of 100 tons daily, but the machinery is so arranged that other furnaces can be added at any time. The excavating has been done and the framework of the building is completed. The foundation and floors are of stone. The Turk M. Co. owns 40 acres of ground as a site for its plant and ample water is held by location. The townsite is at the site of the old town of Cedarville and is called Turk City. Manager Davis of the Turk Co. says that there are 90,000 tons of ore in the Deer Trail camp awaiting treatment, and of this his company owns 30,000 tons. The Turk mine is a mile distant from the plant and eventually a tramway will be put in to transport the ores. The company owns eight claims on which are ledges of copper, gold and silver ores. A. W. Turner of Davenport is president.

Snohomish County.

Machinery for the compressor plant of the Wilman Bros.' mine at Monte Cristo is in place, and it is expected the drill will be in operation at the Golden Chord mine this week. About 200 feet of the crosscut tunnel remains to be driven. The pack train of eight horses makes one round trip a day to the Lucky Day mine, west of Silver lake, taking down one-half a ton of high-grade ore each trip. The first shipment will be ready to go to the smelter next week.

Whatcom County.

Bellingham reports say the equipment for treating the ores of the Great Excelsior mine, near Mount Baker, is being increased so as to double the output of the mine and also increase the saving of values. The new machinery is being set up by T. Cox, superintendent at the Excelsior. Besides the fifteen stamps now in operation, which have been treating fifty tons of ore a day and saving only about 40% of the values, two new Sturtevant crushers and a Bryan roller mill are being put in. It is expected to have these in operation this week, when the mine will turn out 100 tons daily. Instead of two carloads of concentrates monthly it is expected the property will hereafter turn out five. Forty-two men are employed. A main working tunnel has been driven into the ledge.

WYOMING.

Big Horn County.

T. J. Grier, J. Blatchford, H. Schnitzel et al. of Lead, S. D., compose the Galena Ridge C. M. Co. at Kirwin. The company has obtained United States patent to 1000 acres of ground, and machinery for sinking is on the ground and work will start setting up this week. There are said to be on the company's ground five parallel veins of copper ore. They are all opened more or less at the surface, where they show promising values in copper. A tunnel has been started on the easterly side of the vein series and is being driven west, crosscutting the veins at a depth of 900 feet. On the west side of the series a shaft is being put down, and the machinery will be used there. There is said to be on the ground sufficient water to generate 10,000 H. P., which the company intends to use.

Carbon County.

The Dillon Con. M. & T. Co. has been incorporated and proposes to drive a 3500-foot tunnel, starting north of the Dillon townsite, crosscutting the formation from south to north. Such a tunnel is expected to cut at depth at least eight veins which have been opened to some extent in places, affording opportunity to prospect and develop those veins from one adit tunnel and give ample drainage to Dillon mountain. The company is stated to have bought the ground between the Ferris-Haggerty and Batchelder mines, east and west, a distance of 1 mile, the company's holdings being bounded on the north by the Pluto and on the south by the Bohemian. The tract comprises twenty-eight lode claims and 320 acres of placer and timber lands. Fifteen of the claims are patented.

FOREIGN.

AFRICA.

Transvaal.

The Transvaal Chamber of Mines at Johannesburg reports the gold output for June, 1904, of the mines which have so far restarted working amounted to 299,913 fine ounces for the Witwatersrand, being a decrease of 6673 ounces as compared with the previous month. The return for the outside districts is 8306 ounces, an increase of 412 ounces. The total for the Transvaal for the month of June is, therefore, 308,219 ounces fine gold. The following table gives the output in fine ounces for the first six months of 1904 compared with 1903:

	1904		Total.
	Rand. Ozs.	Outside. Ozs.	
January.....	278,867	9,957	288,824
February.....	282,450	7,061	289,512
March.....	299,425	8,617	308,042
April.....	297,470	8,476	305,946
May.....	306,586	7,894	314,480
June.....	299,913	8,306	308,219
Totals.....	1,764,897	50,316	1,815,213

	1903		Total.
	Rand. Ozs.	Outside. Ozs.	
January.....	192,955	6,345	199,280
February.....	187,977	8,536	196,513
March.....	208,456	9,009	217,465
April.....	218,900	8,971	227,871
May.....	224,409	9,716	234,125
June.....	228,167	10,153	238,320
July.....	242,070	9,573	251,643
August.....	262,569	9,349	271,918
September.....	267,513	8,584	276,097
October.....	275,664	8,880	284,544
November.....	272,107	7,706	279,813
December.....	278,710	7,351	286,061
Totals.....	2,859,477	104,273	2,963,750

AUSTRALIA.

New South Wales.

Sydney reports say the following minerals were exported from New South Wales during the half year ending June 30: Silver, 594,267 ounces, valued at £62,369; silver-lead bullion, 182,556 tons, valued at £885,880; copper, 5123 tons, valued at £243,392; tin, 1344 tons, valued at £156,895; coal, 1,562,168 tons, valued at £690,236. These figures show a net increased value of £141,064, as compared with the corresponding period of 1903.

A heavier winding plant is being put in by the Broken Hill South S. M. Co. at Broken Hill.

After being idle several months, the Tingha Tin Dredge Co. plant at Tingha has resumed operations. Alterations have been made increasing its capacity.

The experimental saltcake plant put up in the Broken Hill Proprietary's old leaching works at Broken Hill is reported making satisfactory runs. It is treating daily sixty tons of tailings. The recovery being made is over 90% zinc, the product ranging from 40% to 45%, while the waste, which is said to go as low as 1.7%, is worthless, except for refilling purposes. During one week 600 tons of zinc product were sent out from the Proprietary, resulting from the saltcake process of treatment.—G. D. Delprat, manager of the Broken Hill Proprietary Co. at Broken Hill, says the yearly output of the Broken

Hill Proprietary Co. is 600,000 tons of ore, averaging 16% zinc. Taking the output of the other mines along the line of lode as being about the same quantity, it appears that 200,000 tons of zinc are taken out of the Broken Hill mines yearly.

Queensland.

C. Graham, manager of the All Nations Sluicing Co. of Palmerville, is putting hydraulic equipment on the company's holdings and expects to be ready for operations by Sept. 1. The company owns 300 acres on the Palmer river, 30 miles below Maytown.

The Kangaroo Hills M. & S. Co., at Townsville, is increasing operations at the mine and the smelters have been blown in. The management expects to turn out 50% copper matte. The smelters will keep forty men at work.

Activity is reported in wolfram mining near California creek and Coolgarra, in Herberton district. Several camps, comprising from twenty to forty men each, have been formed.

Victoria.

The gold output from the mines at Bendigo during the first six months of 1904 has been 120,029 ounces.—The South New Moon Co., at Bendigo, for the half year crushed 13,199 loads for 13,606 ounces gold and paid £40,000 in dividends. To date the company has returned to shareholders £234,000. The total cost of mining the gold was £10,389, or 15s 9d per load, made up as follows: Wages, 9s 2d; mining charges, 2s 3d; firewood, 8d; pyrites treatment, 6d; management, 11d; battery treatment, 2s 2d.

Western Australia.

The gold yield of Western Australia for month of June was 200,356 ounces, showing a decrease of 7703 ounces compared with June, 1903. The yield for the first six months of 1904 was 1,178,132 ounces, a decrease of 43,626 ounces compared with 1903.

BRAZIL.

The Camaquã C. M. Co. is operating copper mines at Camaquã, 50 miles from Rio Negro station, on the Southern Brazilian Railway, and 2 miles from the Camaquã river, in the State of Rio Grande. The company is building a plant for handling 80 tons of ore daily. The concentrates will be smelted to a 50% copper matte. Water power will run the plant. The present monthly output of the mine is 100 tons of ore assaying 28% copper. This is sacked and shipped to England. The ore is said to contain no lead, arsenic or zinc. As it comes from the mine the ore is dumped onto a grizzly and then a 1-inch mesh perforated plate. Water is sprayed on the mineral and it is hand sorted. The picked rich ore assays 30% copper. The barren rock goes to the waste dump, while the remainder—averaging 7% copper—is put through a small mill equipped with breaker, rolls, trommels, hand jigs and round buddles. The concentrated product assays 28% copper. The ledges are intruded into sandstone and conglomerate beds, but the best values are obtained where the lodes occur in the hard conglomerate, as in the softer rock they lack regularity and continuity. An upper adit driven 520 feet northeasterly cuts a gabro dike which is not seen on the surface. The veins are said to diverge from this dike. Of the four veins being worked, three are cut by two tunnels 200 and 380 feet, respectively, below the summit of the hill. The fourth is opened by a drift just below the outcrop, and carries chalcopryite in a quartz and heavy spar gangue. The other three carry copper glance near the surface and bornite, chalcopryite and pyrite lower down. The lower adit has been driven 780 feet and has cut three veins showing only copper glance. It will be continued to 3300 feet to open other lodes which outcrop at the surface.

BRITISH COLUMBIA.

East Kootenay District.

It is reported that the run at the St. Eugene concentrator at Moyie for the month ending July 31st handled 3000 tons, or an average of 100 tons a day. Several days were lost in putting the new rope on the aerial tram. The body of ore opened up in No. 1 tunnel is showing well in size and values. The ore runs 50% lead and 40 ounces silver. Work is progressing in the shaft. The tunnel at the 125-foot level is in 900 feet and they are drifting on the ore body, which is 7 feet in width. Drifting is being done on other cross veins. There are 300 men employed.

The Grace Dore group of mines on Wild Horse creek, 3 miles from Fort Steele, is owned by R. Dore. Development work consists of a tunnel, which is showing a ledge 5 feet in width and carries values in nickel. A shaft is down 30 feet in ore. The vein is a contact. Assay returns are said to give 9% to 14% nickel, with values in cobalt. Another ledge, 10 feet in

width, parallels the nickel lead, and is said to carry values in silver.

#### Nelson District.

The Chapleau group on Lemon creek, near Nelson, together with a 10-stamp mill, aerial tramway and a mining plant, will be taken over by F. Stock et al. of Nelson, who have a lease on the property from the Chapleau M. Co., Ltd., subject to an option to buy for \$50,000. The 10-stamp mill has concentrating tables, electric lights and is operated by water power. Considerable development work has been done on the mine.

The monthly production of ore from the mines around Ymir is estimated, says the Rossland Miner, as follows:

	Tons.
Ymir (50 stamps).....	4,500
Hunter V.....	1,500
Wilcox.....	500
Queen.....	500
Second Relief.....	500
Arlington.....	100
Total.....	7,600

Work is being resumed on the Copper Farm mine, near Green City, on the North Fork of the Salmon river. G. Green, owner, says he intends putting in a small stamp mill near the townsite.

Operations at the Hunter V. mine at Ymir are proceeding smoothly and the output is being increased. The output is being drawn entirely from the Hunter V. itself, and is first handled by the auxiliary tram from the upper workings to the terminal at the main tram. This tram was built by the company and was intended to handle fifty tons per day. It has, however, already handled sixty-five tons per day without being overtaxed. The system of mining being used in the glory hole on the Hunter V. is economical, and satisfactory results are obtained with a small amount of drilling. One 13-foot hole (driven by hand) after being sprung five times was finally loaded with 100 sticks of powder. The result was over 300 tons of rock broken down.

Ten stamps are dropping steadily at the Second Relief mine, near Ymir. Twenty men are working at mine and mill.—The B. C. Standard Co. has acquired 500 inches of water on Porcupine creek for supplying power to the Hunter V. mine at Ymir.

#### Rossland District.

Shipments of concentrates are being made from the War Eagle-Center Star mill at Rossland to the Trail smelter. As yet the shipments have been small and intended, in a sense, as experiments. The cyanide section will also be in operation this week.—The White Bear works will be in operation before September 1st so far as straight water concentration is concerned. The Elmore process machinery is not yet delivered. All the plant required for water concentration is on hand.

#### West Kootenay District.

In the Lardau, development on Rapid creek is proving values in the ground. The Broken Hill Co., Ltd., of Spokane, Wash., which bought the Broken Hill and Combine claims last spring, has been prospecting the surface of the claims and has uncovered veins cutting the formation with values in gold, says Manager Potter. Assays from the arsenical iron run high. The company intends to put in machinery.—C. T. Potter has an option on the Bow Bells and Albion mines, near Ferguson, both of which show free gold.

Butte, Mont., men, including W. Scallion, J. Gillie, C. W. Goodale, C. F. Booth et al., have organized the Bayonne G. M. Co., Ltd., and have bought the Bayonne group of mines in the Goat river mining division, 20 miles north of the international boundary line and 25 miles west of Kootenay river. They are reached by a rough mountain trail from the river. The company will build a wagon road from the river to the mines. The working force at the mines is in charge of H. W. Heague. The upper tunnel is in 600 feet, showing 31 feet of ore with gold and silver values. A second tunnel 500 feet lower is in 850 feet, showing 4 feet of sulphide ore. A stamp mill will be built.

The district from Howser lake to the headwaters of the Duncan, in the Lardau, is being developed. Manager Miller of Vancouver has gone to Trout lake to carry out the plans of the Con. M. & S. Co. of B. C. The company has control of the Primrose, Old Gold and Mountain Lion groups, near Trout lake, shipments from which have given returns of \$80 a ton. An electric railway is to be put in to take out the ores of the Old Gold basin and the company proposes to put in reduction works if necessary.

#### Yale District.

The Mount Baker & Yale M. Co. of Whatcom, Wash., expects to have its 10-stamp mill in operation by September 15. The framework for the stamps is up and ready for installation of the machinery, which is on the ground. Men have been kept developing the property and ore is being uncovered. It is near Yale.—The

International G. M. Co., whose lead is a continuation of the Mount Baker & Yale's, is putting in machinery. The saw mill is completed and is cutting lumber. The International is also opening up ore.

### CANADA.

#### Yukon Territory.

White Horse reports say J. Irving, owner of the Arctic Chief copper mine, has put men to work on a drift to determine the extent of the copper-bearing ore body. If satisfactory, he will put in machinery this fall.

The report of the Geological Survey of Canada for the past year shows that since 1896 over \$97,000,000 of gold has been shipped out of the Canadian Yukon. The production of precious metals in that district amounted to only a few hundred thousand dollars' worth eight years ago. In 1900 it went to \$22,000,000, but since that year it has steadily declined until last year the production amounted to \$12,250,000. It is stated that practically all this gold has been taken out of claims in about half a dozen creeks in the Klondike district, and the decreasing production is largely attributed to the exhaustion of the best deposits. Although the production is apparently decreasing, it is shown, on the other hand, that mining activity in the Yukon is increasing. Machinery is being introduced for mining operations, with the result that many abandoned claims and low-grade gravels are being worked.

### MEXICO.

#### Chihuahua.

N. O. Bagge of Los Angeles, Cal., has bought the Central y Annexas and the Ampliación (increase of claims) of the Little Emma mine in the Sierra Almoleya district, between Jimenez and Parral, for \$100,000. D. W. Shanks is manager and will start work this week. The properties are in northeast end of the Cerro Almoleya. The surface indications show carbonates of lead. Bagge is developing properties in the same camp for the Almoleya M. Co. of Los Angeles, Cal., in which he is principal owner. The work of the company will be increased and an electric power plant is to be built at Dorado station, on the Parral branch of the Mexican Central, and from this the power will be transmitted to the workings in the mines on the mountains, 5 miles away.

J. W. Malcolmson says the main producers in Santa Eulalia camp, 15 miles from Chihuahua, are the Potosi mine, and the Santo Domingo mine of the Chihuahua M. Co. These two mines produce 8000 tons monthly of low-grade lead ore, which are tied up on a large tonnage contract for at least four years more. The Santa Eulalia M. Co. has ceased production. The mines leased by the American S. & R. Co. for a term of years are the Mina Vieja, Dolores and Old Santo Domingo, producing 4500 tons of ore monthly. The Buena Tierra mine is producing 1000 to 1500 tons of ore monthly, shipped under contract to the American S. & R. Co., through the latter company's shaft. The San Antonio mine carries reserves of ore assaying 350 grams silver, 15% lead, 20% silica, 18% iron and 10% lime. It belongs to the American S. & R. Co. and is at present shut down. The monthly output of the camp is summarized as follows:

	Tons.
Potosi.....	6,500
Chihuahua M. Co.....	1,500
American S. & R. Co.....	4,500
Buena Tierra.....	1,500
Parionera.....	900
Prieto Estate.....	500
Other shippers.....	300
Total.....	15,700

F. Collinson, of Clarendon, Tex., owner of the Kansas Boy mine in Santa Eulalia camp, says he has arranged for resuming work on that property. The work is to be done in two places on the mine. The new shaft, down 130 feet, will be continued and the old Mexican workings will be cleaned out and continued.

#### Coahuila.

Sierra Mojada camp is reported producing about 8500 tons per month, divided among the companies as follows: American S. & R. Co., 6050 tons; Cia Metalurgica, 1350 tons; Esperanza M. Co., 50 tons; other shippers, 500 tons. The American S. & R. Co. owns the Volcan, Dolores and San Jose mines and operates the Fronteriza mine under lease. The Cia. Metalurgica Mexicana operates the Veta Rica and Esmeralda mines. The Constancia Co. operates the Tiro Once and receives royalties from several other mines. The Esperanza Co. operates the Fortuna mine. The Fronteriza Co. owns the Fronteriza and receives 250 tons monthly as a royalty.

#### Jalisco.

The Keystone C. S. Co., owning nine mines in La Palma district, west of Tlalpa, has centered its operations on La Mexicana, and has opened it up by a

crosscut tunnel 140 meters long. The concentrating mill consists of a Dodge rock breaker, one 14x27 and one 12x20 crushing rolls, three concentrating tables, etc. Reduction is accomplished in a reverberatory matting furnace burning wood. A. L. Walters is manager.

#### Lower California.

El Boleo C. Co., operating El Boleo copper mines near Santa Rosalia, owned by the Rothschilds of Paris, in its report for the calendar year 1903 shows a production of 10,480 metric tons of copper, a decrease of 473 tons from 1902. The decrease is attributed to shortage of labor. Average recovery from all ore treated is given as 4.56% copper, an improvement over 1902. The stock of matte and black copper on hand at end of year was valued at \$649,786. The water-carrying system was completed from Santa Agueda to Santa Rosalia, being 16,074 meters long. An average of about 1500 men were on the payroll.

Guaymas reports say that of the 500 Japanese lately arrived at El Boleo copper mines at Santa Rosalia, opposite Guaymas, only sixty have gone to work in accordance with the terms of the contract under which they were engaged. The others have refused to work on those conditions. El Boleo copper mines are owned by a French company in which the Paris Rothschilds are principal owners. The company is said to have spent a large amount of money in the advance made to laborers and for payment of transportation from Japan to Mexico.

#### Oaxaca.

The New Orleans M., M. & D. Co. has been organized to operate on the New Orleans, Louisiana, Emilda and other mines, in El Pairian and Nochistlan mining districts. T. W. Carey, Jr., is president and G. W. Sumner, of Oaxaca, manager and director.

C. Cadmus et al. have organized in New Orleans, La., the New Orleans M., M. & D. Co. to erect a mill to work ores in Oaxaca. The incorporators are J. A. Abshire, T. W. Carey Jr., K. V. Richard and O. C. Snell of New Orleans, La., G. W. Sumner of Oaxaca and C. Cadmus of Mexico City.

#### San Luis Potosi.

At his El Mesquit mine, near San Luis Potosi, O. B. Hardy proposes putting up a 50-ton smelting furnace.

#### Sinaloa.

At La Dura mine, near Casala, F. Aragon, owner, says he is preparing to put in a plant of mining machinery.

#### Sonora.

At Campo Hays in the Pinito mountains, the Hays Con. M., M. & L. Co.'s 20-stamp mill will be put in operation by Sept. 1st, under supervision of G. Watts of Nogales, Ariz., and a larger number of men will be employed by Manager Henley.

#### Zacatecas.

B. C. Wheeler will put in a cyanide plant at Sombereite, where he is operating La Noria and San Bartolo mines under lease and bond. He has been treating the ores by amalgamation process, but recent test runs under the cyanide process are reported having been successful.

### VENEZUELA.

According to a contract published at Maracaibo, writes U. S. Consul E. H. Plumacher, the government of Venezuela grants to A. Espina the right to exploit four asphalt mines, three in the district of Perija and one in district of Maracaibo. The government is to receive 25% of the net proceeds. The contract is to run for twenty-five years from the day that a railroad is built.

## Personal.

J. H. MACKENZIE is in Rossland, B. C., from San Francisco, Cal.

T. H. SCHIEMAN has taken charge of the Summit View mine, Felix, Cal.

J. W. BROCK, a mine owner of Tonopah, Nev., is in San Francisco, Cal.

C. E. JOHNSON, a mine manager of Yreka, Cal., is in San Francisco, Cal.

J. S. MCBRIDE, a mine owner of North San Juan, Cal., is in San Francisco, Cal.

W. S. HUPP, JR., of Weaverville, Cal., is in San Francisco, Cal., on mining business.

J. F. KELLEY now has charge of the West Gold Hill M. & M. Co., Gunnison, Colo.

R. MCCLOSKEY is superintendent of the East Griffith mine, near Georgetown, Colo.

E. ST. JOHN, superintendent of the Tin-

ton Tin Co., at Tinton, S. D., is in the East.

ROBERT HARRISON of Peterborough, Canada, has returned there from Silverton, Colo.

J. GEO. LEYNER has returned to Denver, Colo., from a business visit to Georgetown, Colo.

E. J. LANDERS, a mine owner of Sonora, Tuolumne county, Cal., is in San Francisco, Cal.

F. L. RANSOME, in charge of the U. S. Geological Survey party in Idaho, is in Wallace, Idaho.

F. L. MINER is mine superintendent of the St. Paul M. Co., operating near Georgetown, Colo.

S. A. MOSS of Montpelier, Vt., interested in northern California mines, is in San Francisco, Cal.

A. J. McMILLAN, managing director of Le Roi mine, Rossland, B. C., has returned from London.

ALBERT L. WATERS has left Mexico on vacation and will be at Spring Lake, Mich., until October.

S. I. HALLET, formerly identified with the Smuggler mines at Aspen, Colo., is in Salt Lake City, Utah.

LOUIS RUHL is now assistant secretary of the Roessler & Hasslacher Chemical Co. of New York City.

N. O. BAGGE, of Los Angeles, Cal., is examining mining interests at Sierra Almoleya, Chihuahua, Mex.

S. V. TRENT has returned to Salt Lake City, Utah, from Silverton, Colo., where he arranged to build a mill.

J. M. SHERRERD of the Taylor Iron & Steel Co., Hightbridge, N. J., is visiting the Lake Superior country.

F. L. BOSQUI of San Francisco, Cal., is at the Gold Roads mine at Acme, Ariz., on a short professional trip.

MARK MANLEY, manager of the Enterprise and Yellowstone mines, Trinity county, Cal., is in Boston, Mass.

H. K. WHEELER of Los Angeles, Cal., and V. C. Osment of San Francisco, Cal., have returned from Dayton, Nev.

G. WATTS of Nogales, Ariz., is mill superintendent of the Hays Con. M. & M. Co. at Campo Hays, Sonora, Mex.

E. HEARTT has resigned as superintendent of the National G. & S. M. Co. at Stein's Pass, Grant county, N. Mex.

F. W. HOAR, former superintendent of the Old Dominion mine, Globe, Ariz., will open a mining office in El Paso, Tex.

W. H. BREVORT of New York City, N. Y., interested in California gold and silver mines, is in San Francisco, Cal.

ROSCOE CORNELL has been appointed manager of the branch office which the Allis-Chalmers Co. has opened in El Paso, Texas.

R. GUENTHER is superintendent of the National G. & S. M. Co. at Stein's Pass, Grant county, N. Mex., vice E. Heartt, resigned.

R. C. REESE, manager and part owner of the Dixie Meadows mine, near Prairie City, Or., returned there last week after a visit East.

D. W. SHANKS, manager of the Almoleya M. Co., at Sierra Almoleya, Chihuahua, Mex., has returned there from Los Angeles, Cal.

RALPH NICHOLS, manager of the Great Boulder Perseverance G. M. Co., Ltd., is in London, Eng., from Kalgoolie, Western Australia.

F. COLLINSON, owner of the Kansas Boy mine at Santa Eulalia, Chihuahua, Mex., returned to Clarendon, Tex., last week from the mine.

SUPERINTENDENT ALEXANDER, of the Cochise Con., is about to transfer his headquarters from El Paso, Tex., to Douglas, Ariz.

G. A. DUNCAN, manager of the Gilt Edge-Maid G. M. Co., near Galena, S. D., has returned from a business trip to Denver, Colo.

W. H. BRULE is superintendent of the concentrator of the North American C. Co. at Grand Encampment, Wyo., vice R. B. Lamb, resigned.

T. H. TULLOCH of Washington, D. C., is inspecting the Sevier Co.'s mines on Gold Mountain, Piute county, Utah, in which he is interested.

W. H. WOODHEAD has returned from London to resume his former position as manager at the British Broken Hill mine at Broken Hill, N. S. W.

G. W. WILKENS, mine superintendent

of the Goldstake, returned to the mine near Maitland, near Deadwood, S. D., last week from Denver, Colo.

M. L. MACDONALD, W. W. AND C. P. MORRIS of Butte, Mont., are visiting the Montana-Tonopah mines at Tonopah, Nev., in which they are interested.

W. G. PHIPPS has resigned as superintendent of the Shady Run M. Co. and has taken charge of the John Royal gold mine near Columbia, Tuolumne county, Cal.

THOMAS GRAHAM, for a number of years connected with the Helen M. Co., Graham, N. M., is manager of the Highland Mary mine, at Howardsville, near Silverton, Colo.

F. M. SKIFF has resigned as superintendent of the Bon Air mine, near Leadville, Colo., to become manager of the Grand Trunk group at Holy Cross, near Red Cliff, Eagle county, Colo.

R. B. LAMB has resigned as superintendent of the concentrator of the North American C. Co. at Grand Encampment, Wyo., and has gone to Ballarat, Victoria, Australia, on mining business.

WM. H. ARMSTRONG, formerly manager of the Chicago Pneumatic Tool Co., now has charge of the pneumatic tool department of the Ingersoll-Sergeant Drill Co., 26 Cortlandt St., New York.

L. D. SIVYER of Los Angeles, Cal., having recently been in the Ures mining district of Sonora, Mex., and the Oak Flat district, Tuolumne county, Cal., is in San Francisco, Cal., on professional business. Mr. Sivyver will visit Virginia City and Aurora, Nev., before returning to Los Angeles, Cal.

PROFESSOR H. S. MONROE of Columbia University at New York City, has returned to the joint summer school of mining of which he was in charge at Georgetown, Clear Creek county, Colo. The students were from Harvard, Yale, the Massachusetts Institute of Technology and Colorado School of Mines.

Obituary.

P. C. WEBER, a mine owner and manager of Ely, Nev., died at Ely on the 1st inst., aged 58 years. Deceased was born in Brooklyn, N. Y., going from there to Nevada in 1875.

C. A. SCHENK, a civil engineer of Berkeley, Cal., died on the 4th inst. Deceased was 68 years of age and a native of Germany. He graduated from Freiburg University, in Saxony, and was formerly Professor of Mineralogy of the Imperial College of Japan.

D. E. COUGHANOUR, a pioneer of Boise basin, Idaho, died on the 2nd inst. at Quartzburg, Idaho. Deceased was born in Fayette county, Pennsylvania, in 1824. He went to California in 1852, where he engaged in placer mining, and then to Centerville, Idaho, in 1863. He bought the Gold Hill mine at Quartzburg in 1869. He also owned and worked other mines in that section—the Iowa group and mines on Canyon creek.

Commercial Paragraphs.

THE Stromberg-Carlson Telephone Manufacturing Co., manufacturers of mine telephone apparatus, Chicago, have recently sold nine apparatus and other supplies to the Cambria Fuel Co., Cambria, Wyo., who are successors to the Cambria M. Co.

E. A. RIX, of the Rix Compressed Air & Drill Co. of San Francisco, Cal., has arranged for the manufacture and sale of the Torpedo rock drill. The company owning this drill will introduce it in Europe and America, with the exception of the Pacific coast, which territory will still be retained by the Rix Compressed Air & Drill Co.

THE C. O. Bartlett & Snow Co., Cleveland, Ohio, report orders from the city of Winnipeg, Manitoba, for one four-compartment, direct-heat rotary dryer, capacity 100 tons of sand per day; the Silver Cup Mines, Ltd., Ferguson, B. C., one single-cylinder, direct-heat rotary dryer, using waste heat from ore roasters, capacity fifty tons of slimes a day; James Kirk & Co., Chicago, Ill., one steam dryer; Washington Carbon Co., for a complete outfit, conveying and elevating machinery for their new plant at Wellsville, W. Va.; the Semi-Steel Co., Cleveland, Ohio, elevating and conveying machinery for large brick plant to be erected at St. Paul, Minn.

Books Received.

"Types and Details of Bridge Construction," is the title of a handsomely illustrated volume of 294 pages, by Frank W. Skinner, M. Am. Soc. C. E. The work treats of the most modern practice of bridge and truss construction, showing what types are best suited for particular purposes. It deals with structures of wood, iron and steel, spandrel-braced arches, arch trusses and plate-girder arches, giving numerous illustrated examples of successful construction. It is a book valuable to the civil engineer. Price, \$3. The McGraw Publishing Co., 114 Liberty street, New York City.

"The Baraboo Iron-Bearing District of Wisconsin," being bulletin No. XIII of the Wisconsin geological survey, by S. Weidman, geologist. This volume describes in an interesting manner the occurrence of important iron deposits in that State, dealing largely with the geology and economic aspect of these deposits. The ore bodies are of pre-Cambrian age, the deposits being discovered by means of churn and diamond drilling through sandstone and drift. The work is profusely illustrated. It will be sent to those interested on application to the director of the geological survey, Madison, Wis.; 10 cents paper cover, 20 cents cloth.

Trade Treatises.

"Gas for Power and Fuel" is the subject of a monograph from R. D. Wood & Co., Philadelphia, Pa.

An excellent description of the Kimpen crusher, finely illustrated, is sent by the Kimpen Crusher & Pulverizer Co., suite 1102, 100 Washington St., Chicago, Ill.

"Concrete Construction," published by Bruce & Johnston, 42 Broadway, New York, furnishes further convincing argument for the use by engineers of that artificial stone in many forms of structural work.

"High Grade Pumping Machinery" is the subject of the latest catalogue issued by the Krogh Manufacturing Co. of San Francisco, Cal., and is fully illustrated with cuts of direct-driven by both steam and electricity and belt-driven centrifugal pumps; also sand, gravel and hydraulic dredging pumps. The Krogh gravel mill for disintegrating gold-bearing cement gravels is also the subject of a separate illustrated treatise from the Krogh Manufacturing Co.

Latest Market Reports.

SAN FRANCISCO, August 19, 1904.

METALS.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 57½c, refined (1000 fine); San Francisco, 57½c; Mexican dollars, 47½c San Francisco, 45½c New York.

COPPER.—New York: Standard, \$12.75; Lake, 1 to 3 casks, \$12.62½; Electrolytic, 1 to 3 casks, \$12.75; Casting, 1 to 3 casks, \$12.50; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £57 2s 6d spot per ton.

LEAD.—New York, \$4.20; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £11 16s 3d long ton.

SPELTER.—New York, \$4.85; St. Louis, \$4.75; London, £22 10s per ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$26.75@27.00; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, \$30@32½c. London, £121 10s spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@82c per gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 17s 6d San Francisco, local, \$41.50@43.00 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.00@42.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic; chemically pure, \$3.10, 50c; dust, \$3.10; sulphate, \$3.10, .04c.

NICKEL.—New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.85 @13.20; gray forge, \$12.00; San Fran-

cisco, bar, 3c per lb., 3½c in small quantities. STEEL.—Bessemer billets, Pittsburg, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c per lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, 4c per lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, 4c, per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for car-load lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

CEMENT.—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c per lb.; carloads, 22@23½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, \$2.00@2.25; California refined, 1¼@2c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66° B, 1¼@2c per lb.; nitric acid, carboys, 8c per lb.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linseed, boiled, bbl, 57c; cs., 62c; raw, bbl, 55c; cs., 60c; Lucol oil boiled, bbl, 50c; cs., 55c; raw, bbl, 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c;

Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

BORAX.—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c per lb.

CHROMIUM.—Best, \$2.00 per lb.

CHROMIUM.—90% and over, per lb., 80c.

PHOSPHORUS.—American, per lb., 70c.

SILVER.—Chloride, per oz., 90c@91.00; nitrate, 55c.

MERCURY.—Bichloride, per lb., 77c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—per lb., \$2.75.

SODIUM.—Metal, per lb., 50c.

BISMUTH.—Subnitrate, per lb., \$2.10.

URANIUM.—Oxide, per lb., \$3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 380 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING AUGUST 9, 1904.

- 767,130.—SAW SET—R. Addison, Pasadena, Cal.
- 767,257.—STEP LADDER—G. L. Banks, Santa Ana, Cal.
- 766,926.—VEHICLE WHEEL—C. N. Beal, S. F.
- 766,936.—HAIR RESTORATIVE—V. F. Beede, Stockton, Cal.
- 767,086.—TOOL HOLDER—H. W. Borchers, Portland, Or.
- 767,139.—BOOK SUPPORTER—L. C. De Carl, San Jose, Cal.
- 767,211.—PRESERVING EGGS—N. J. Dobbins, Los Angeles, Cal.
- 767,331.—CIGAR MACHINE—C. L. Driever, S. F.
- 766,994.—REFRIGERATOR—B. S. Fryar, Sumner, Wash.
- 767,054.—BRICKS—H. M. Hanmore, Los Angeles, Cal.
- 766,945.—TELEPHONE—H. I. Hauxhurst, East Oakland, Cal.
- 767,151.—BED OR COUCH—J. Hoey, S. F.
- 767,276.—AMALGAMATOR—F. J. Hoyt, Redlands, Cal.
- 767,341.—WINDOW GLASS—C. J. Hurrie, Stockton, Cal.
- 767,344.—PARING HOOPS—W. G. Jackson, S. F.
- 767,155.—DISPLAY CARD—L. Lemos, S. F.
- 767,364.—BEER DRAWING MACHINE—A. L. Malone, S. F.
- 766,889.—WATER HEATER—J. M. McCartney, S. F.
- 766,964.—WATER HEATER—J. M. McCartney, Glen Ellen, Cal.
- 767,005.—SHOE LACING—J. A. McCoy, Sissons, Cal.
- 767,162.—TRANSPORTING APPARATUS—G. W. McNear, Jr., Oakland, Cal.
- 767,305.—HONEY EXTRACTOR—C. W. Metcalf, San Diego, Cal.
- 767,009.—GOLD DREDGER—O. B. Perry, S. F.
- 767,010.—VEHICLE AXLE—P. C. Peterson, Geyserville, Cal.
- 767,121.—VENDING MACHINE—T. R. Priebe, Reno, Wash.
- 767,124.—HYGIENIC BATH—C. P. Randolph, Los Angeles, Cal.
- 767,247.—PEDAL—H. C. Ross, Piru, Cal.
- 767,015.—THERAPEUTIC MACHINE—H. A. Slaughter, Los Angeles, Cal.
- 767,127.—AUTOMOBILE—A. C. Stewart, Los Angeles, Cal.
- 767,021.—CAMERA—Swartz & Martin, Junction City, Or.
- 767,255.—DRAG SAW—J. T. Tuisku, Everett, Wash.
- 767,092.—PUMP—Walker, Mottern & Gould, Rockford, Wash.
- 767,057.—AIR COMPRESSOR—M. C. Wilkinson, Los Angeles, Cal.
- 767,023.—MOTOR—P. K. Wood, Los Angeles, Cal.
- 766,861.—HAMMER—W. W. Word, Soulsbyville, Cal.
- 766,862.—OIL BURNER—J. A. Young, Los Angeles, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

BEDS OR COUCHS.—No. 767,151. Aug. 9, 1904. John Hoey, San Francisco, Cal. This invention relates to improvements in bed and couch construction. It consists in a novel construction of the mattress frame with a means for counteracting and resisting the tension of the mattress upon the upper part of the frame, to which it is attached, and compensation is provided by means of end frames fulcrumed to the side bars so that while the mattress is stretched from the upper part of said frames suitable tie rods connect the lower parts, and these rods may be tightened from time to time so as to maintain the mattress in the proper state of tension. The construction of these frames also enables the mattress to be made as high as may be desired with relation to the bedstead and its frame.

VEHICLE AXLE.—No. 767,010. Aug. 9, 1904. Peter C. Peterson, Geyserville, Cal. This invention relates to improvements in vehicle axles, and it consists in devices by which the axle is made resilient independent of its connections with the vehicle body.

BOOK SUPPORTER.—No. 767,139. Aug. 9, 1904. L. C. De Carl, San Jose, Cal. This invention consists of a device fitted to and slidable upon a track which is attached to the shelf in proper relation to the books, said device being mounted and projecting so that it may be slidable lengthwise of the shelf and brought to such position that the projecting portion will serve as a support for the books contiguous to it, so that in case of considerable vacant spaces the books would be prevented from falling.

## Practical Geology.

Some important discoveries of iron ore have recently been made near Kimberly, Minnesota, through the result of correlating the geological formations of the district with those of the Mesabi range. Something similar had been attempted in connection with the Baraboo (Wisconsin) district with success. This indicates the value of careful geological exploration. When geological conditions exist which are recognized as favorable to the occurrence of mineral deposits or veins, the district should be thoroughly explored. What conditions may be considered as "favorable indications" may be answered in a general way by saying any conditions similar to those known elsewhere as accompanying valuable mineral deposits may be considered as favorable for a like occurrence at any other place. The occurrence of quartz veins in a schistose or slaty formation may be looked upon as favorable to the occurrence of payable veins of gold, silver, lead, etc. Any region in which sedimentary rocks—limestones, sandstones, shales and quartzites—are uplifted by intrusive rocks and intersected by dikes, is a good region to prospect for beds of ore, contact veins and irregular deposits. Leadville, Colo., is such a district; so also is Aspen, Colo., the Terry's Peak region of the Black Hills and at Eureka, Nev. The copper deposits of Bisbee and Globe, Ariz., and those of Cananea, Mexico, occur under these conditions, and many other similar instances might be mentioned. Any country in which the rocks are much disturbed, fissured, broken and folded and intruded by dikes should be searched for mineral; so also should places where there is evidence of much mineralization—the occurrence of iron-stained dikes, veins and masses. These usually denote the presence of ore in greater or less amount. However, mineral regions are not always greatly disturbed, for ore is often found in sedimentary beds, like limestones and quartzites, shales, etc., which are lying apparently in almost normal position. The sandstones and shales of Silver Reef, Utah, are good

Silver Ledge Mine and Mill of the San Juan Mining & Leasing Co., Near Silverton, Colo.—(See Page 146.)

examples of this fact. There the rocks were found to contain payable values in silver—chloride and native silver principally—while little disturbed or fractured. Many of the telluride gold deposits of the Terry Peak region of South Dakota lie almost horizontal, apparently little disturbed; still, in the latter instance, the intrusive dikes and the injected sheets of a laccolith are also present.

There are some regions where the amount of quartz is small, but still the rocks are fissured and the veins

are gold bearing. Examples of this sort are found in the Western Australia gold fields. In some instances the zone of mineral bearing ground is so wide as to at first escape identification as a vein. The miner is usually in search of a defined deposit or a vein with walls, but in these large masses the absence of clearly defined walls, within, what seems to him reasonable proximity, may lead him to overlook a great mine. The Treadwell mines\* of Alaska are something of this sort. In the northern end of the Cargo Muchacho mountains of San Diego county, Cal., large masses of siliceous hornblende schist carry payable gold values. These deposits do not show well defined walls, and can scarcely be detected from the normal country rock, excepting for a faint copper stain (malachite) occasionally seen, though this indication is more in evidence below than at the surface. There is a remarkable lack of "mineralization" of the sort the miner searches for in these deposits.

Dikes are sometimes gold bearing, though occasionally showing no evidence of it in stains of iron. It is not uncommon to find a vein much mineralized and oxidized by weathering, carrying a good grade of silver at the surface, but in depth becoming comparatively low grade, and developing values in copper which do not appear at the surface at all. Of this character are some of the veins of the Lava Beds district in San Bernardino county, Cal. There are regions in which large portions of the formation are essentially the same—a fine grained mica schist, for instance, stained red from finely disseminated hematite. In this broad zone occur certain smaller, though large, zones of pay rock. There are instances of this kind where iron stained schists run in belts a mile or two broad in which may occur a dozen or more comparatively small zones of pay rock with more or less massive quartz. The Homestake mines of South Dakota are something of this character.

Beside these might be mentioned many other interesting occurrences, but enough have been cited to indicate the great variety of geological conditions under which mineral veins occur, and whenever conditions are found resembling those of another district, whether near or far, then prospecting should be carefully done.

## Discovery the Stimulus of Mining.

Within the past four years unusual activity has characterized the mining industry in southern Nevada, and it is extending over into California and Arizona, the circle of discovery and achievement constantly widening. The beginning of this reawakening in southern Nevada—for that section had experienced mining booms prior to this—dates back to the discovery of Tonopah. The development of the rich ores of that camp soon resulted in building a good-sized town on the gentle slopes at the foot of Mount Oddie. A new center of industry was established from which the prospector could carry on his search. Other veins and districts were discovered—Klondyke, Gold Mountain and Goldfields, Hanapah and others, around each of which a village has quickly sprung up in the sagebrush covered, sandy valleys. Each newly established camp renders the work of the prospector, that of extension of the known mineral field, easier. Eldorado canyon, Hiko, Logan and Good Springs were lively camps years before the discovery of Tonopah, so long since that they have been nearly forgotten by the old timers, and are almost unknown to the new ones in the field. Resting Springs in California, just over the line from Nevada, in this same desert region, was also an active camp forty years ago. Throughout the vast desert region of the Southwest, covering over 60,000 square miles, a renewed activity in mining is noticeable, which is being stimulated by the almost daily reports of new discoveries, and by the construction of railroads, which will solve to a great extent the two vexed problems of that arid region—transportation and water. The railroads usually supply the prospector with water without charge, that he may the more readily carry on his

work of pioneering, and thus develop the mineral resources of the country which otherwise would remain for many years untouched, as they have in the past. The wisdom of this policy on the part of the railroads is at once apparent, for the discovery and development of a single good mine, to say nothing of the opening of a new district, will be a source of profitable revenue to them far exceeding the expense of supplying these searchers of the desert with a few hundred gallons of water. The railroads will aid the development of the country in a way that can be accomplished in no other manner. It has been the history of other mining regions, and it can not fail to be true of the great deserts of the Southwest.

## Actual Discovery Necessary.

The mining law of the United States requires an actual discovery of ore or mineral-bearing rock in place as a prerequisite to the making and filing of a location on the public lands. In some instances this works a great hardship upon the prospector, and it seems desirable that a change be made in this law. Among the instances where a bona fide discovery is impossible without months of time and the expenditure of much money is the finding of mineral under such conditions, for instance, as obtain under the lower portion of the city of Leadville, Colo., where the "first contact" is buried beneath several hundred feet of glacial lake beds, composed of sand, gravel and cobbles, and several hundred additional feet of porphyry. Another type is found in some of the ancient river channels of California, which, in some instances, are hidden beneath 500 to 3000 feet of volcanic debris, and can only be reached by means of a deep shaft or a lengthy tunnel run usually through the hard rim rocks—with more or less uncertainty in either case as to the result, owing to lack of knowledge of the exact level of the channel. In Mexico this condition is appreciated, and the laws allow one year on deep placers for prospecting purposes, during which time the locator may have exclusive possession of the ground claimed, for the purpose of investigating and making a possible discovery. If the strict letter of the law be enforced in the United States, one of limited means might commence the work of investigation by beginning the sinking of a shaft, and continuing for several weeks or even months, when a wealthy individual or company could start a shaft on the same claim and by use of superior equipment and abundant means sink so much more rapidly than the first party on the ground as to reach the ore or channel before him, when, having made the first actual discovery, the second party could oust the first—which is manifestly unfair, though in strict accordance with the law. The proof of recording and marking a claim will not authorize the court to presume a discovery, and if no discovery be made until after the act of location, the location must date from the time of actual discovery. Under our laws priority of discovery gives priority of right against naked location and possession without discovery. The case of Crossman v. Pendery, 8 Fed., 693, is one in point. There are many places where the geological conditions are such that a bona fide discovery is impossible without the expenditure of much time and money. These include places where existing veins have been covered by later flows of lava or the deposition of later sedimentary formations.

THE removal of a number of men from the Cripple Creek district whose presence was undesirable is evidence that fires of the peculiar class of unionism prevailing there still smoulder, and, fearing a renewal of labor difficulties, or, possibly, additional assassinations, the property owners—they who have something to lose—have anticipated trouble by removing the disturbing element. At present the mining industry in that district is again prosperous, having assumed a normal condition after the strenuous contentions of the past few months.

THE American Mining Congress has been in session during the past week at Portland, Or. A number of resolutions were passed, among them those having a bearing on forest reserves and the misuse of the mails for the promotion of fraudulent mining schemes. At this writing no city has been selected as the next place of meeting.

## The Evolution of Metallurgical Invention.

The efforts of metallurgical engineers and chemists is constantly in the direction of cheapening known processes, rather than toward the invention of new ones to replace the old, though there is an army of technically educated experimenters engaged in the latter effort. The practical workers have less time usually to devote to the working out of new processes, the details of which are unfamiliar. This work is left to the scientific experimenter whose time is not so fully occupied with other matters. Between these two classes of workers much that is good is evolved. Each is entitled to credit for the work he performs, and each has a place in the field of metallurgy. The experimenter designs a new type of furnace, and the practical worker gives it a trial. If it meets the requirements it is retained, and in time the practical metallurgist corrects its faults and improves upon its virtues until the best work obtainable is achieved. If it fails to give satisfactory results it is "turned down," no matter how vigorously the inventor may plead its utility and excellence. Twenty years ago the manufacturer of a certain pulverizer in which the crushing was accomplished by two sets of rolls, stood and watched his machine in operation on extremely hard quartz rock. The pieces fed to the machine were much too large—2 to 3 inches in diameter. The gears began to cut and in a few minutes they were so worn that the cogs no longer engaged. Steel gears were ordered and the trial again made, but the results were so unsatisfactory that the machine was condemned by the mill superintendent, who wanted prompt and definite results. The maker of the pulverizer said: "When the ore is crushed to the size of hazel nuts and beans, my machine will be all right." In this he was correct, for machines of similar type operate with entire satisfaction to-day and have been in use for years; but the rock fed to them is crushed in breakers to a suitable size. The maker and inventor of the machine had the correct idea; but he was not a thoroughly practical man, or he would have made the necessary arrangements to crush the rock finer before sending it to his pulverizer. On the other hand, the superintendent of the mine had no time to build pulverizers or to experiment to great length with those offered. He had tried several varieties, including stamps and grinding pans, but all proved unsatisfactory. This last pulverizer, proving no better than the others, was thrown out and the stamps replaced. This illustrates the history of many machines designed to perform some important function in metallurgy or mining. The maker is experienced and practical up to a certain point, and the metallurgist is often devoid of mechanical ability and destitute of suggestions. These two meet and the result is failure for the time being; but ultimately, if the machine has merit, out of disappointment and inexperience a machine is evolved which meets every requirement, and success results to both the inventor and the operator.

## Mining in the Orient.

The recently issued report of the Oriental Con. M. Co. of New York City, operating in Korea, contains considerable that is of interest to the mining world. The operating profit for the year 1903, which is the period covered by the report, was over \$762,000 gold coin of the United States, the total value of the ore being \$1,478,956, and the amount treated 203,567 tons, or an average value of \$7.27 per ton—thus showing that a comparatively low-grade mine can be successfully operated in the Far East, though occupying an isolated position where transportation is attended with many difficulties. The cost of mining, including all development work, was about \$1 per ton. The cost of milling was 50 cents per ton, the total cost of mining, milling and general expenses bringing the total cost per ton to \$2.225. The mills and machinery are run by water power, and during the year 40% of the values of the ore were saved in the concentrates. These are cyanided, the extraction being about 77%, at an average cost of about \$1.22 per ton. The company operates a total of 200 stamps, which, owing to certain extraordinary local conditions, were only run 278 days out of the 365 of the year. This increased somewhat the operating cost, though it was lowered during 1903 over the figures of 1902.

# CONCENTRATES.

THE value of assessment work performed on an unpatented mine is usually fixed by the value of a day's work in the camp where the mine may be situated. If buildings or machinery are substituted for labor, the cost should be readily arrived at.

IT has been suggested that where gold ores are difficult of amalgamation, owing to the presence of graphite and molybdenite, that the ore be crushed and concentrated before amalgamation. The water will carry away most of the undesirable element.

IN Illinois lead ore has been found in the southern part of the State, including Hardin, Pope, Union and Saline counties, and has been mined with more or less regularity since 1842. Large amounts of fluor spar is also obtained in these districts from the lead mines.

IN many instances where the water flows from copper mines it pays to run the water through a line of boxes containing tin scrap, which precipitates any copper present. These boxes must have a very low fall, or the current will carry away any cement copper precipitated.

IF amalgamating is to be done in the battery it is usually good practice to use as little water in the mortar as possible, adding it outside if necessary. This promotes amalgamation. An increase of water in the battery increases the discharge of pulp from the mortar.

TO TEST for heavy spar, fuse the mineral with sodium carbonate, place the fused mineral on a clean silver coin and add a drop of water. The presence of sulphur in the mineral will be shown by the formation on the metal surface of a yellowish or brown stain of silver sulphide.

THE law that the proportions by mass of the constituents of a chemical compound are invariable is known as the law of definite proportions. The law is based on a large number of analyses and syntheses of well known compounds, the composition of which has been found to be constant within the limits of errors of experiment.

THE Mexican law passed December 25, 1901, permits concessions to be acquired for the exploration of petroleum. In Mexico whenever an expert report indicates the probability of the existence of deep placers of gold or precious stones, one year may be conceded for prospecting work. The depth of shaft for such work may be whatever is necessary.

A LAUNDER or flume designed to carry mill pulp in a cold country, and where it is not intended to cover it, must be given a heavy grade or the pulp will freeze, quickly causing the box to overflow. A 5% grade is not too much for this purpose, and if the temperature falls very low, even more than this may be necessary, if it is not found desirable to cover it.

THE cost of building a reverberatory furnace varies greatly with the size of the furnace, the kind of materials employed, cost of labor, etc. These costs vary in different parts of the United States and in other parts of the world. A desulphurizing furnace for roasting is usually longer than a smelting or matting furnace. Reverberatories cost usually from \$3500 to \$7000, according to size and location.

MISSED HOLES should always be reported to the foreman or superintendent of the mine, and the fact conspicuously posted on a bulletin board for this purpose. There is no element of danger greater in mining than that of a missed hole. The failure of an employee to report a missed hole should have attached the penalty of discharge, as a man who thus carelessly endangers the lives of his fellow workmen is too dangerous a person to encourage him to remain.

THE assayer must necessarily have a knowledge of mineralogy in order that he may intelligently mix the charges for assaying, for all ores cannot be fluxed with the same charge and get equally accurate results. Some ores require a preliminary roasting before placing in the crucible. One may "pick up" a smattering of knowledge of assaying the more simple ores in a short time, but to become thoroughly competent in the profession requires much careful study and preparation, and after that an extended and varied experience.
